APPENDIX D – *Hyalella azteca* Toxicity Test Data

Hyalella azteca ~~Sediment~~ Water-only Test Summary Sheet

Client: Teck
Work Order No.: 211568

Start Date: Aug. 12/21
Set up by: RZ | KJL

Sample Information:

Sample ID: Various - see below
Sample Date: Aug. 10, 17, 24, 31/21
Date Received: Aug. 11, 18, 25/21, Sept. 1/21
Sample Volume: 1x20L ; 2x20L

Test Organism Information:

Species: *Hyalella azteca*
Supplier: Aquatic Biosystems
Date received: Aug. 11/21
Age or size (Day 0): 7-8 days

* Indicates a significant difference compared to control.
α Indicates a significant difference compared to reference site FR-UFR1.
β Indicates a significant difference compared to reference site GH-ER2.
† Indicates a significant difference compared to reference site CM-MC1.
ε Indicates a significant difference compared to reference site LC-SLC.

NaCl Reference Toxicant Results:

Reference Toxicant ID: HA202
Stock Solution ID: n/a
Date Initiated: Aug. 12/21

96-h LC50 (95% CL): 6.9 (5.6-8.4) g/L NaCl

96-h LC50 Reference Toxicant Mean and Range: 6.2 (3.9-9.8) g/L NaCl CV (%): 23

Test Results:

Sample ID	Survival ± SD (%)	Average Dry Wt. ± SD (mg)
Control	96.0 ± 8.9	0.86 ± 0.15
FR-UFR1	94.0 ± 8.9	0.61 ± 0.12*
GH-ER2	98.0 ± 4.5	0.53 ± 0.11*†
CM-MC1	98.0 ± 4.5	0.77 ± 0.07
LC-SLC	94.0 ± 5.5	0.55 ± 0.05*†
FR-FRARCH	92.0 ± 11.0	0.47 ± 0.11*†
FR-FRCP1	98.0 ± 4.5	0.46 ± 0.14*†
GH-FR1	100.0 ± 0.0	0.49 ± 0.11*†

This report has been prepared by Nautilus Environmental Company Inc. based on data and/or samples provided by our client and the results of this study are for their sole benefit. Any reliance on the data by a third party is at the sole and exclusive risk of that party. The results presented here relate only to the samples tested.

1.0 INTRODUCTION

Nautilus Environmental conducted toxicity tests for Teck Coal Ltd. (Teck) on water samples collected from various locations in the Elk Valley as part of a quarterly toxicity testing program required under the BC Ministry of Environment and Climate Change Strategy permit number 107517.

Stations sampled in the fourth quarter of 2021 are shown in Figure 1; stations shown as green symbols align with the integrated chronic toxicity testing program, which was designed to eliminate redundancy between Permit 107517 and Permit 106970 toxicity testing programs. The integrated program was approved by BC Ministry of Environment and Climate Change Strategy on March 4, 2019 (BC ENV 2019). Species requiring quarterly testing include a cladoceran (*Ceriodaphnia dubia*) and a unicellular green alga (*Pseudokirchneriella subcapitata*). On a semi-annual basis, tests using rainbow trout (*Oncorhynchus mykiss*; Q2 and Q4), an amphipod (*Hyalella azteca*; Q2 and Q4), and fathead minnows (*Pimephales promelas*; Q1 and Q3) are also required. Figure 1 stations shown as orange symbols align with the upper Fording River chronic toxicity testing program, which is a supplemental study for 2021 to satisfy Section 4D2.5 of Permit 107517. The upper Fording River program includes the same test species and testing frequency as the regional program, except that green alga is not tested.

Water samples used for testing were transported in 20-L plastic containers in coolers containing ice packs. Samples were received at temperatures ranging from 0.0 to 9.6°C and were stored in the dark at 4 ± 2°C prior to testing. Table 1 summarizes the toxicity tests that were conducted on each sample as well as sample collection dates. Samples were collected weekly on the dates shown in Table 1 for the duration of the *H. azteca* and *O. mykiss* tests. All tests were conducted at the Nautilus Environmental laboratory in Burnaby, BC.

This report presents the results of the toxicity tests. Copies of laboratory data sheets and printouts of statistical analyses are provided in Appendices A through D. The chain-of-custody forms are provided in Appendix E. Results of analytical chemistry that was performed on the samples tested in this program are uploaded by Teck to the Environmental Management System database. Analytical chemistry water samples were collected by Teck personnel at the same time the water samples were collected for toxicity testing.

* Site water controls

Upper Fording River samples from the supplemental study for 2021

† Testing of the station RG_MIDAG is not a permit requirement but was added to characterize the spatial extent of effects observed in CM_MC2

‡ Testing with *C. dubia* and *P. subcapitata* was conducted with water collected on October 12th; testing with *H. azteca* and *O. mykiss* was conducted with water collected on October 12th to November 9th.

2.0 METHODS

Methods for the toxicity tests using *C. dubia*, *P. subcapitata, H. azteca*, and *O. mykiss* are summarized in Tables 2 to 5. Laboratory control water was prepared using deionized water with 20% Perrier for *C. dubia*; deionized water with supplemented nutrients for *P. subcapitata*; reconstituted water prepared by addition of reagent grade salts to dechlorinated Metro Vancouver municipal tap water for *H. azteca* according to a recipe provided in Environment Canada (2013); and dechlorinated Metro Vancouver municipal tap water for *O. mykiss*.

For *C. dubia*, the test protocol specifies that test duration must be 7 ± 1 day, with the test being terminated on the day that at least 60% of control organisms have produced three broods. To provide additional information on reproduction patterns in the samples, and as requested by Teck, the tests were extended to 8 days, regardless of when 60% of controls had produced three broods. The results reported below were calculated based on the specifications of the test method, which in this case was based on the reproduction that had been observed up to Day 6 of exposure. The additional information on reproduction up to Day 8 of exposure is available in Appendix A.

For the *H. azteca* tests, all site waters were supplemented with 25 mg/L chloride and 0.02 mg/L bromide using NaCl and NaBr, respectively, in accordance with recommendations by the Hyalella Advisory Group (chaired by Chris Ingersoll, USGS; Norberg-King *et al.*, 2014). Insufficient concentrations of these halides are known to impair growth of this species. The laboratory control water contained approximately 75 mg/L chloride and 0.8 mg/L bromide.

As requested by Teck, all waters used in tests with *O. mykiss* were amended with 20 µg/L copper to reduce potential for confounding effects from microbial growth (Nautilus 2020). Rainbow trout embryo-alevin tests were performed using a blocked design (*i.e.*, eggs from one fish were used for replicate A of each test concentration, eggs from the second fish for replicate B, and so on). The blocked design approach was a planned deviation from the Environment Canada test method, which indicates that the eggs should be pooled prior to testing. However, this modification is considered appropriate because it reduces the risk of non-viable eggs from a single fish affecting the results of the entire test.

Statistical analyses were performed using CETIS (Tidepool Scientific Software, 2013), and involved comparison of results to both the laboratory and site water controls.

Table 2. Test conditions: *Ceriodaphnia dubia* survival and reproduction test.

Test species	*Ceriodaphnia dubia*
Organism source	In-house culture
Organism age	<24-hour old neonates, produced within a 12-hour window
Test type	Static-renewal
Test duration	8 days[1]
Test vessel	20-mL glass test tube
Test volume	15 mL
Test solution depth	10 cm
Test concentrations	100% (undiluted) sample, plus laboratory control
Test replicates	10 per treatment
Number of organisms	1 per replicate
Control water	20% Perrier water and 80% deionized water + 5 µg/L Se and 2 µg/L vitamin B12
Test solution renewal	Daily (100% renewal)
Test temperature	25 ± 1°C
Feeding	Daily with *Pseudokirchneriella subcapitata* and TCC[2] (3:1 ratio)
Light intensity	100 to 600 lux at water surface
Photoperiod	16 hours light / 8 hours dark
Aeration	None
Test measurements	Temperature, dissolved oxygen, pH and conductivity measured daily; hardness and alkalinity of undiluted sample measured at test initiation; survival and reproduction checked daily
Test protocol	Environment Canada (2007a), EPS 1/RM/21
Statistical software	CETIS Version 1.9.4
Test endpoints	Survival and reproduction
Test acceptability criteria for controls	≥80% survival; ≥15 young per surviving control producing three broods; ≥60% of controls producing three or more broods; no ephippia present
Reference toxicant	Sodium chloride (NaCl)

[1] Test duration was extended to 8 days to provide additional information on patterns of reproduction. Summarized data and calculated endpoints are based on results from Day 6, according to the standard test procedure; however, all the data through 8 days are provided in Appendix A.

[2] TCC = Trout Chow + cerophyl

Table 3. Test conditions: *Pseudokirchneriella subcapitata* growth inhibition test.

Test species	*Pseudokirchneriella subcapitata*, strain CPCC# 37
Organism source	In-house axenic culture, obtained from Canadian Phycological Culture Center, and originally isolated from Nivelta River, Norway.
Organism age	3-to 7-day old culture in logarithmic growth phase
Test type	Static
Test duration	72 hours
Test vessel	Microplate
Test volume	220 µL
Test concentrations	Full strength sample diluted to 95.2% (v/v) by addition of nutrients, plus laboratory control
Test replicates	4 per treatment; 8 for laboratory control and site controls
Number of organisms	10,000 cells/mL
Control water	Deionized water supplemented with nutrients
Test solution renewal	None
Test temperature	24 ± 2°C
Feeding	None
Light intensity	3600 to 4400 lux
Photoperiod	24 hours light
Aeration	None
Test measurements	Test area temperature measured daily; temperature and pH measured at test initiation; pH of two control wells measured at test termination
Test protocol	Environment Canada (2007b), EPS 1/RM/25
Statistical software	CETIS Version 1.9.4
Test endpoints	Algal cell growth inhibition
Test acceptability criteria for controls	>16-fold increase in number of algal cells; CV ≤ 20%; no trend when analyzed using Mann-Kendall test
Reference toxicant	Zinc (added as $ZnSO_4$)

Table 4. Test conditions: *Hyalella azteca* survival and growth test.

Test species	*Hyalella azteca*
Organism source	Aquatic Biosystems, CO
Organism age	7- to 8-days old
Test type	Static-renewal
Test duration	28 days
Test vessel	375-mL glass container
Test volume	300 mL
Test concentrations	100% (undiluted) samples amended with 25 mg/L Cl and 0.02 mg/L Br, plus laboratory control
Test replicates	5 per treatment
Number of organisms	10 per replicate
Control water	Reconstituted water containing ~75 mg/L Cl and 0.8 mg/L Br (Environment Canada 2013). Samples were supplemented with 25 mg/L Cl and 0.02 mg/L Br.
Test solution renewal	Twice daily (~80% renewal)
Test temperature	23 ± 1°C
Feeding	1 mL of YCT daily to each container. Tetramin daily, with amounts increasing weekly; Week 1: 0.25 mg, Week 2: 0.5 mg, Week 3: 1 mg, Week 4: 1.5 mg in each test container.
Light intensity	500 to 1000 lux at water surface
Photoperiod	16 hours light / 8 hours dark
Aeration	None
Test measurements	Temperature, dissolved oxygen, pH and conductivity measured daily; hardness and alkalinity measured upon arrival; hardness and alkalinity measured at test termination; total ammonia measured at test initiation and termination
Test protocol	Modified from US EPA (2000), as described in Norberg-King et al. (2014)
Statistical software	CETIS Version 1.9.4
Test endpoints	Survival and dry weight
Test acceptability criteria for controls	Mean control survival of ≥80%, dry weight ≥0.10 mg
Reference toxicant	Sodium chloride (NaCl)

Table 5. Test conditions: *Oncorhynchus mykiss* embryo-alevin development test.

Test species	*Oncorhynchus mykiss*
Organism source	Lyndon Fish Hatcheries, ON
Gamete quality	Small amount of water added to milt on a dry glass slide; verification of vigorous sperm motility using a compound microscope (100 X magnification)
Organism age	<30 minutes post fertilization, <24-hour old gametes
Test type	Static-renewal
Test duration	Test terminated 7 days after ≥50% of controls hatch
Test vessel	4-L plastic containers
Test volume	2 L
Test solution depth	17 cm
Test concentrations	100% (undiluted sample) amended with 20 µg/L Cu, plus laboratory control
Test replicates	4 per treatment
Number of organisms	30 per replicate
Control water	Dechlorinated Metro Vancouver municipal tap water
Test solution renewal	Daily (80% renewal)
Test temperature	14 ± 1°C
Feeding	None
Light intensity	Dark
Photoperiod	24 hours dark; low intensity light used during solution renewals
Aeration	Continuous gentle aeration
Test measurements	Temperature, dissolved oxygen, pH and conductivity measured daily; hardness and alkalinity of undiluted sample measured upon arrival; survival checked daily
Test protocol	Environment Canada (1998), EPS 1/RM/28
Statistical software	CETIS Version 1.9.4
Test endpoint	Survival, viability (which assesses incidence of deformities), length, wet weight
Test acceptability criteria for controls	≥65% normally developed hatched fish
Reference toxicant	Sodium dodecyl sulphate (SDS)

3.0 RESULTS

3.1 *Ceriodaphnia dubia*

Results of the toxicity tests using *C. dubia* are provided in Table 6. The site water control samples from FR_UFR1, GH_ER2, CM_MC1 and LC_SLC performed similarly to the laboratory control, indicating that there were no adverse effects associated with the upstream stations.

There were no adverse effects on survival in any of the samples tested; survival ranged between 90 and 100%. Significantly lower reproduction relative to one or more controls was observed in FR_FRCP1, CM_MC2, RG_MIDAG, EV_HC1, LC_DCDS, LC_LC3, FR_FR4, FR_FR2, FR_MULTIPLATE, and FR_FRRD.

3.2 *Pseudokirchneriella subcapitata*

Results of the toxicity tests using *P. subcapitata* are provided in Table 7. The cell yield in site controls FR_UFR1, GH_ER2, CM_MC1 and LC_SLC was 4.5- to 4.7-fold greater than the laboratory control. This finding is not unusual, since the higher ionic strength associated with the site water controls would be expected to stimulate cell growth of this species relative to the very low ionic strength associated with the laboratory control water.

Significantly lower cell yield relative to one or more site controls was observed in all samples tested, except FR_FRCP1. Significant growth stimulation was observed in all samples tested compared to the laboratory control. Percent stimulation ranged between 214.7 and 372.0%.

3.3 *Hyalella azteca*

Results of the toxicity tests using *H. azteca* are provided in Table 8. Survival and dry weight among site controls FR_UFR1, GH_ER2, CM_MC1 and LC_SLC was similar to the laboratory control indicating there were no adverse effects associated with the upstream stations.

Significantly lower survival relative to FR_UFR1 was observed in LC_DCDS. Significantly lower dry weight relative to one or more controls was observed in GH_ERC, LC_DCDS, FR_FR4, and FR_FRRD.

3.4 *Oncorhynchus mykiss*

Results of the toxicity tests using *O. mykiss* are provided in Table 9. The site water controls FR_UFR1, CM_MC1, GH_ER2 and LC_SLC performed similarly to the laboratory control for all

endpoints (survival, viability, length, and wet weight), indicating that there were no adverse effects associated with the upstream site waters.

Adverse effects on survival and embryo viability were observed in FR_FRCP1 and GH_FR1 when compared to one or more controls. Survival ranged between 69.3 and 94.1% and embryo viability ranged between 68.4 and 89.9% across all samples. No adverse effects on length or wet weight were observed in any of the samples tested.

There were no observations of unusual behavior observed in fish exposed to any of the samples. Microbial growth was observed following hatch in one or more replicates of each of the following samples: GH_ER2, LC_SLC, FR_FRABCH, FR_FRCP1, GH_FR1, GH_ERC LC_DCDS, LC_LCDSSLCC, FR_FR2, FR_MULTIPLATE, and FR_FRRD. Instances of microbial growth were observed during a timeframe spanning day 16 to day 27 of testing.

Table 6. Results: *Ceriodaphnia dubia* survival and reproduction test.

Sample ID	Survival (%)	Reproduction (Mean ± SD)
Laboratory Control	100	23.0 ± 3.3
FR_UFR1 (Site Control)	100	22.9 ± 4.9
GH_ER2 (Site Control)	100	23.2 ± 5.9

4.0 QA/QC

The health histories of the test organisms used in the exposures were acceptable and met the requirements of the test protocols. Tests met all control acceptability criteria and water quality parameters remained within ranges specified in the protocol throughout the tests. Uncertainty associated with the test is best described by the standard deviation around the mean.

Protocol deviations, beyond the planned modifications described in Section 2.0, occurred in the *C. dubia*, *H. azteca* and *O. mykiss* tests. On day 7 of the *C. dubia* test, no water replenishment or water quality was performed due to insufficient sample. Neonates were still removed and the test tubes were fed a 3:1 ratio of algae:TCC. Upon arrival of the *H. azteca* organisms, the temperature of the holding water measured between 20.0 to 20.5°C (a change of greater than 3°C during transport) and the dissolved oxygen measured less than 80%. The organisms and holding water were acclimated overnight to increase the temperature and dissolved oxygen percentage. These deviations are not anticipated to influence results of the tests. In the *O. mykiss* test, continuous aeration failed for a single FR_FRRD replicate on day 25 of the test resulting in mortality of all remaining alevins. This replicate alone was removed from the final analysis.

Results of the reference toxicant tests conducted during the testing program are summarized in Table 10. All endpoints fell within the acceptable range for organism performance of two standard deviations around the mean, based on historical results obtained by the laboratory with these tests. Thus, the sensitivity of the organisms used in these tests was appropriate. The reference toxicant tests were performed under the same conditions as those used for the samples.

Table 10. Reference toxicant test results.

Test species	Endpoint	Historical mean (2 SD Range)	CV (%)	Test date
C. dubia	Survival (LC50): 2.0 g/L NaCl	2.0 (1.8 – 2.2)	5	October 5, 2021
	Reproduction (IC50): 1.7 g/L NaCl	1.8 (1.4 – 2.2)	12	
P. subcapitata	Growth (IC50): 35.2 µg/L Zn	31.9 (26.6 – 38.3)	9	October 28, 2021
H. azteca	Survival (LC50): 6.9 g/L NaCl	6.2 (4.2 – 9.2)	20	October 14, 2021
O. mykiss	Viability (EC50): 5.0 mg/L SDS	5.0 (2.4 – 10.3)	38	October 13, 2021

SD = Standard Deviation, CV = Coefficient of Variation, LC = Lethal Concentration, IC = Inhibition Concentration

REVISION 1 UPDATES

Previously missing temperature and conductivity data (Day 0), as well as dissolved oxygen and pH data (Day 28) for sample FR_FRRD in the *H. azteca* tests has been added to the appendix.

APPENDIX A – *Ceriodaphnia dubia* Toxicity Test Data

Ceriodaphnia dubia Summary Sheet

Client: TECK
Work Order No.: 212108

Start Date/Time: Oct. 13/21 @ 1300h
Set up by: SAK / JZL

Sample Information:

Sample ID: Various - see below
Sample Date: Oct. 12/21
Date Received: Oct. 13/21
Sample Volume: Various

Test Validity Criteria:

1) Mean survival of first generation controls is ≥80 %
2) At least 60% of controls have produced three broods within 8 days
3) An average of ≥15 live young produced per surviving female in the control solutions during the first three broods.
4) Invalid if ephippia observed in any control solution at any time.

WQ Ranges:

T (°C) = 25 ± 1; DO (mg/L) = 3.3 to 8.4 ; pH = 6.0 to 8.5

Test Organism Information:

Broodstock No.: BBi100721A ~~#2-9, 12-14~~ SAK ; BBi100121A
Age of young (Day 0): <24-h (within 12-h)
Avg No. young in first 3 broods of previous 7 d: 27
Mortality (%) in previous 7 d: 10.7
Individual female # used ≥8 young on test day: #2-9, 12-14, 16-18, 21-27 ; #5, 13, 17, 18, 20

NaCl Reference Toxicant Results:

Reference Toxicant ID: cd293
Stock Solution ID: 21Na02
Date Initiated: Oct. 5/21

7-d LC50 (95% CL): 2.0 (1.7-2.3) g/L NaCl
7-d IC50 (95% CL): 1.7 (1.3-1.9) g/L NaCl

7-d LC50 Reference Toxicant Mean and Historical Range: 2.0 (1.8-2.2) g/L NaCl CV (%): 5
7-d IC50 Reference Toxicant Mean and Historical Range: 1.8 (1.4-2.2) g/L NaCl CV (%): 12

Test Results:

	Survival (%)	Reproduction (Mean ± SD)

CORRECTIVE ACTION FORM

Entry No.: 2021-221
Date: ~~Jan Dec 9/21~~ Oct 20/21
Identified By: SAK

Nature of the problem:

- ☐ Reference Toxicant outlier
- ☐ Test / Reference Toxicant Failure
- ☐ Organism Health Problem
- ☑ Policy / Procedure Non Conformance
- ☐ Preventive Action
- ☐ Instrument Problem
- ☐ PT Failure
- ☐ Audit Finding
- ☐ Complaint
- ☐ Failed/Canceled Tests

Risk Level:	None/ Low →	Medium	High

Affected Test IDs: TECK-QA-212108

Problem Description: ~~Sample was not changed~~ NO water change was preformed on day 7 due to insufficient sample. Due to this no water quality was measured either.

Immediate Action Taken:
Young were counted and removed ~~by~~ test tubes were fed a 3:1 ratio of ~~TCL~~ Algae : TCL. ~~Supervisor was contacted~~ Project mangers were consulted.

Action Taken by: SAK Date: Oct. 20/21

Attempt at Resolution and Root Cause Identification:
Sample was thrown away prematurely. Due to controls having already passed and tear down the next day, it was determined not changing them was best course of action.

Evaluation of CAR Significance and Impact Analysis:
Communication failure. This could have impacted / compromised the test if it happened to other samples in the middle of testing. Should implement a system to prevent this from happening again.

Action Taken by: [signature] Date: Dec 2/21

Corrective Action Results:

Further Follow-Up Action (based on risk level) Required ? Y N
If yes, explain what action will be taken: This is a deviation from the project plan. Note in the final report.

Action Taken by: _____ Date: _____

Item needs to be reviewed at Internal Audit ? Y (N)
Date all action completed: Dec. 9/21

APPENDIX B – *Pseudokirchneriella subcapitata* Toxicity Test Data

Pseudokirchneriella subcapitata Summary Sheet

Client: TECK
Work Order No.: 212107

Start Date: Oct. 14/21
Set up by: SAK

Sample Information:

Sample ID: Various-see below
Sample Date: Oct. 12/21
Date Received: Oct. 13/21
Sample Volume: Various

Test Organism Information:

Culture Date: Oct. 8/21
Age of culture (Day 0): 6d

Zinc Reference Toxicant Results:

Reference Toxicant ID: SC221
Stock Solution ID: 21Zn01
Date Initiated: Oct. 28/21

72-h IC50 (95% CL): 35.2 (27.9 - 41.5) µg/L Zn

72-h IC50 Reference Toxicant Mean and Range: 31.9 (26.6 - 38.3) µg/L Zn CV (%): 9

Test Results:

All samples are significantly greater than the lab control.

Results that are significantly lower than:
a = FR-UFR1
b = GH-ER2
c = CM-MC1
d = LC-SLC

	Cell Yield (Mean± SD)
Negative Control	18.8 ± 0.7
FR-UFR1	86.8 ± 5.0
GH-ER2	88.5 ± 4.6
CM-MC1	84.1 ± 5.6
LC-SLC	86.0 ± 5.8
FR-FRABCH	73.2 ± 3.0 a,b,c,d
FR-FRCP1	73.0 ± 7.0
GH-FR1	71.2 ± 5.9 a,b,c,d
GH-ERC	65.2 ± 7.8 a,b,c,d

APPENDIX C – *Hyalella azteca* Toxicity Test Data

Hyalella azteca ~~Sediment~~ Water only Test Summary Sheet

Client: Teck
Work Order No.: 212109

Start Date: Oct. 14/21
Set up by: JW

Sample Information:

Sample ID: Various - see below
Sample Date: Oct. 12, 19, 26, Nov. 2, 9/2021
Date Received: Oct. 13, 20, 27, Nov. 3, 4, 10/2021
Sample Volume: 4 x 20L

α Indicates a significant difference compared to reference site FR-UFR1.

β Indicates a significant difference compared to reference site GH-ER2.

ε Indicates a significant difference compared to reference site CM-MC1.

No statistically significant survival or growth responses were detected in any of the samples relative to the lab control.

Test Organism Information:

Species: *Hyalella azteca*
Supplier: Aquatic Biosystems
Date received: Oct. 13/21
Age or size (Day 0): 7-8 days

NaCl Reference Toxicant Results:

Reference Toxicant ID: HA 217
Stock Solution ID: n/a
Date Initiated: Oct. 14/21

96-h LC50 (95% CL): 6.9 (5.7 - 8.4) g/L NaCl

96-h LC50 Reference Toxicant Mean and Range: 6.2 (4.2 - 9.2) g/L NaCl CV (%): 20

Test Results:

Sample ID	Survival ± SD (%)	Average Dry Wt. ± SD (mg)
Control	92.0 ± 8.4	0.43 ± 0.06
FR-UFR 1	98.0 ± 4.5	0.49 ± 0.06
GH-ER 2	96.0 ± 5.5	0.56 ± 0.12
CM-MC1	90.0 ± 17.3	0.56 ± 0.06
LC-SLC	96.0 ± 5.5	0.49 ± 0.13
FR-FRABCH	96.0 ± 5.5	0.62 ± 0.11

H. azteca Water-only Toxicity Test Data Sheet

28-d Survival and Weight

Client: Teck
Work Order No: 212109
Sample ID: Various - see below

Start Date: Oct. 14/21
Termination Date: Nov. 11/21
Test Organism: *Hyalella azteca*
Balance: 1

APPENDIX D – *Oncorhynchus mykiss* Toxicity Test Data

Embryo-Alevin Test Summary Sheet

Client:	Teck	Test Date:	October 13 - November 12, 2021
Work Order No.:	212110	Test Species:	*Oncorhynchus mykiss*

Sample Information:

Sample ID:	Various - see table below
Sample Date:	October 12, 19, 26, November 2 and 9, 2021
Date Received:	October 13, 20, 27, November 3, 4 and 10, 2021
Sample Volume:	(2 - 5) x 20 L per refresh

Dilution Water:

Type:	Dechlorinated Tap Water
Hardness (mg/L CaCO3):	20 - 23
Alkalinity (mg/L CaCO3):	18 - 20

Test Organism Information:

Batch No:	101321		
Source:	Lyndon Trout Hatchery, New Dundee, ON	Number male broodstock used:	4
Loading Density:	1.02 g	Number female broodstock used:	4
Sperm motility check:	Verification of sperm motility using a compound microscope		

SDS Reference Toxicant Results:

Reference Toxicant ID:	RTE162
Stock Solution ID:	21S02
Date Initiated:	October 13, 2021
7-d EC50 (95% CL):	5.0 (4.8 - 5.3) mg/L SDS

Reference Toxicant Mean and Range:	5.0 (2.4 - 10.3) mg/L SDS
Reference Toxicant CV (%):	38

Test Results:

Sample ID	Survival (%) (Mean ± SD)	Normal (%) (Mean ± SD)	Length (mm) (Mean ± SD)	Wet weight (mg) (Mean ± SD)

This report has been prepared by Nautilus Environmental Company Inc. based on data and/or samples provided by our client and the results of this study are for their sole benefit. Any reliance on the data by a third party is at the sole and exclusive risk of that party. The results presented here relate only to the samples tested.

1.0 INTRODUCTION

Nautilus Environmental conducted toxicity tests for Teck Coal Ltd. (Teck) on samples collected from various locations in the Elk Valley as part of a quarterly toxicity testing program required under the BC Ministry of Environment and Climate Change Strategy permit number 107517.

Stations sampled in the third quarter of 2021 are shown in Figure 1; stations shown as green symbols align with the integrated chronic toxicity testing program, which was designed to eliminate redundancy between Permit 107517 Section 9.8 (ii) and Permit 106970 toxicity testing programs. The integrated program was approved by BC Ministry of Environment and Climate Change Strategy on March 4, 2019 (BC ENV 2019). Species requiring quarterly testing include a include a cladoceran (*Ceriodaphnia dubia*) and a unicellular green alga (*Pseudokirchneriella subcapitata*). On a semi-annual basis, tests using rainbow trout (*Oncorhynchus mykiss*; Q2 and Q4), an amphipod (*Hyalella azteca*; Q2 and Q4), and fathead minnows (*Pimephales promelas*; Q1 and Q3) are also required. Due to the technical laboratory error from the second quarter, the hyalella test was re-initiated in Q3. Figure 1 stations shown as orange symbols align with the upper Fording River chronic toxicity testing program, which is a supplemental study for 2021 to satisfy Section 4D3.6 of Permit 107517. The upper Fording River program includes the same test species and testing frequency as the regional program, except that green alga is not tested.

This supplementary report includes the results of the *Hyalella azteca* toxicity tests alone. These tests were initiated with samples from all stations and were successfully terminated. However, a technical laboratory error rendered the organisms collected at termination unusable and final dry weight measurements could not be collected. Therefore, only survival results are included in this supplementary report. Testing for stations associated with the UFR program (including the upstream reference station on the Fording) were re-initiated right away and were included in the previously submitted Q2 2021 report. Re-testing for stations associated with the regional program occurred in the third quarter.

Water samples used for testing were transported in 20-L plastic containers in coolers containing ice packs. Samples were received at temperatures ranging from 0.0 to 20.6°C and were stored in the dark at 4 ± 2°C prior to testing. Table 1 summarizes the toxicity tests that were conducted on each sample as well as weekly sample collection dates for the duration of the *H. azteca* tests. All toxicity tests were conducted at the Nautilus Environmental laboratory in Burnaby, BC.

Copies of laboratory data sheets and printouts of statistical analyses are provided in Appendix A. The chain-of-custody forms are provided in Appendix B. Results of analytical chemistry that was performed on the samples tested in this program are uploaded by Teck to the Environmental

Management System database. Analytical chemistry samples were collected by Teck personnel at the same time the samples were collected for toxicity testing.

***** Site water controls; # Upper Fording River samples from the supplemental study for 2021

2.0 METHODS

Methods for the toxicity tests using *H. azteca* in Table 2. Laboratory control water for *H. azteca* was reconstituted water prepared by addition of reagent grade salts to dechlorinated Metro Vancouver municipal tap water for *H. azteca* according to a recipe provided in Environment Canada (2013). The laboratory control water contained approximately 75 mg/L chloride and 0.8 mg/L bromide. All site waters were supplemented with 25 mg/L chloride and 0.02 mg/L bromide using NaCl and NaBr, respectively, in accordance with recommendations by the *Hyalella* Advisory Group (chaired by Chris Ingersoll, USGS; Norberg-King et al., 2014). Insufficient concentrations of these halides are known to impair growth of this species.

Statistical analyses were performed using CETIS (Tidepool Scientific Software, 2013), and involved comparison of results to both the laboratory and site water controls.

Table 2. Test conditions: *Hyalella azteca* survival and growth test.

Test species	*Hyalella azteca*
Organism source	Aquatic Biosystems, CO
Organism age	7- to 8-days old
Test type	Static-renewal
Test duration	28 days
Test vessel	375-mL glass container
Test volume	300 mL
Test concentrations	100% (undiluted) samples amended with 25 mg/L Cl and 0.02 mg/L Br, plus laboratory control
Test replicates	5 per treatment
Number of organisms	10 per replicate
Control water	Reconstituted water containing ~75 mg/L Cl and 0.8 mg/L Br (Environment Canada 2013). Samples were supplemented with 25 mg/L Cl and 0.02 mg/L Br.
Test solution renewal	Twice daily (~80% renewal)
Test temperature	23 ± 1°C
Feeding	1 mL of YCT daily to each container. Tetramin daily, with amounts increasing weekly; Week 1: 0.25 mg, Week 2: 0.5 mg, Week 3: 1 mg, Week 4: 1.5 mg in each test container.
Light intensity	500 to 1000 lux at water surface
Photoperiod	16 hours light / 8 hours dark
Aeration	None
Test measurements	Temperature, dissolved oxygen, pH and conductivity measured daily; hardness and alkalinity measured upon arrival; hardness and alkalinity measured at test termination; total ammonia measured at test initiation and termination
Test protocol	Modified from US EPA (2000), as described in Norberg-King et al. (2014)
Statistical software	CETIS Version 1.9.4
Test endpoints	Survival and dry weight
Test acceptability criteria for controls	Mean control survival of ≥80%, dry weight ≥0.10 mg
Reference toxicant	Sodium chloride (NaCl)

3.0 RESULTS

3.1 *Hyalella azteca*

Results of the *H. azteca* toxicity tests are provided in Table 3. The data included here are derived from the group of samples originally intended for Q2 testing (see introduction for clarification). Due to a technical laboratory error, only survival results are available.

The survival of the site controls did not differ from the laboratory control. Adverse effects on survival were observed in CM_MC2 and FR_FR2 when compared to one or more controls.

Table 3. Results: *Hyalella azteca* survival and growth test.

Sample ID	(Mean ± SD)
	Survival (%)
Laboratory Control	94.0 ± 8.9
FR_UFR1 (Site Control)	96.0 ± 5.5
GH_ER2 (Site Control)	92.0 ± 13.0
CM_MC1 (Site Control)	100.0 ± 0.0
LC_SLC (Site Control)	100.0 ± 0.0
FR_FRABCH	96.0 ± 8.9
FR_FRCP1	98.0 ± 4.5
GH_FR1	96.0 ± 5.5
GH_ERC	94.0 ± 8.9
CM_MC2	70.0 ± 12.2 *#‡§
RG_MIDAG	100.0 ± 0.0
EV_MC2	96.0 ± 5.5
EV_HC1	100.0 ± 0.0
LC_DCDS	92.0 ± 8.4
LC_LC3	98.0 ± 4.5
LC_LC5	100.0 ± 0.0
LC_LCDSSLCC	98.0 ± 4.5
FR_FR4	100.0 ± 0.0
FR_FR2	82.0 ± 17.9 ‡§
FR_MULTIPLATE	98.0 ± 4.5
FR_FRRD	96.0 ± 5.5

SD = Standard Deviation
* Result was significantly lower than the laboratory control
# Result was significantly lower than the FR_UFR1 site control
† Result was significantly lower than the GH_ER2 site control
‡ Result was significantly lower than the CM_MC1 site control
§ Result was significantly lower than the LC_SLC site control

4.0 QA/QC

The health histories of the test organisms used in the exposures were acceptable and met the requirements of the test protocols. All tests met control acceptability criteria. Water quality parameters remained within the ranges specified in the protocols throughout the tests and uncertainty associated with these tests is best described by the standard deviations around the means. There were no deviations from the test methodology with the exception of the planned modifications described in Section 2.0. Uncertainty associated with the test is best described by the standard deviation around the mean.

Results of the reference toxicant tests conducted during the testing program are summarized in Table 4. Results for this test fell within the acceptable range for organism performance of two standard deviations around the mean, based on historical results obtained by the laboratory. Thus, the sensitivity of the organisms used in these tests was appropriate. The reference toxicant tests were performed under the same conditions as those used for the samples.

Table 4. Reference toxicant test results.

Test species	Endpoint	Historical mean (2 SD Range)	CV (%)	Test date
H. azteca	Survival (LC50): 8.5 g/L NaCl	5.9 (3.7-9.5)	24	May 20, 2021

SD = Standard Deviation, CV = Coefficient of Variation, LC = Lethal Concentration, IC = Inhibition Concentration, EC = Effective Concentration

REVISION 1 UPDATES

Previously missing dissolved oxygen and pH values (Day 28) for sites EV_MC2 through FR_FR2 in the *H. azteca* test has been added to the appendix.

Hyalella 28-d Survival and Growth Sediment Test

Nautilus Environmental

Batch ID:	07-5364-5346	**Test Type:**	Survival-Growth	**Analyst:**	Karen Lee
Start Date:	20 May-21	**Protocol:**	EPA/600/R-99/064 (2000)	**Diluent:**	
Ending Date:	17 Jun-21	**Species:**	Hyalella azteca	**Brine:**	
Test Length:	28d 0h	**Taxon:**	Malacostraca	**Source:**	Aquatic Biosystems, CO **Age:** 7-8d

March 3, 2022

Memo: Results of the 2021 Toxicity Identification Evaluation testing for FR_FRCP1

To	Cait Good	*From*	Émilie Viczko; Melanie Gallant
Affiliation	Teck Coal Ltd.	*Tel*	(403) 253-7121
e-mail	Cait.Good@teck.com	*e-mail*	emilie@nautilusenvironmental.ca melanie@nautilusenvironmental.ca

Introduction

Nautilus Environmental conducted chronic toxicity tests in 2021 for Teck Coal Ltd. with samples collected from various locations as part of a quarterly toxicity testing program (permit number 107517). Toxicity testing included:

- *Ceriodaphnia dubia* 7-d survival and reproduction,
- *Pseudokirchneriella subcapitata* 72-h growth inhibition,
- *Hyalella azteca* 28-d survival and growth,
- *Pimephales promelas* 32-d survival and growth and
- *Oncorhynchus mykiss* embryo-alevin development.

Samples collected as part of quarterly monitoring from FR_FRCP1 have previously exhibited toxicity in a subset of chronic toxicity tests. Consequently, a Toxicity Identification Evaluation (TIE) approach was incorporated into the testing program using *C. dubia* and *H. azteca*. In particular, an EDTA treatment was employed concurrently with the testing program to evaluate the potential role of divalent metal cations as a cause of toxicity. The results of these test treatments are summarized in this memo.

Methods

TIE treatments involve physico-chemical manipulations of the sample, followed by toxicity tests on the treated and untreated samples to provide information on the cause of toxicity. Treatments are based on general guidance provided by the USEPA. The following TIE treatment was performed on the samples:

- **Ethylenediaminetetraacetic acid (EDTA) chelation**: the sample was treated with 5 mg/L EDTA, which is a chelating agent that binds divalent metal cations, such as copper, cadmium, nickel and zinc, and reduces their bioavailability. Thus, a reduction in toxicity following treatment with EDTA indicates that a metal that can be chelated with EDTA may be responsible for toxicity.

Treated and untreated samples were tested concurrently, so that any effect of the treatment could be discerned. A control treatment in which EDTA was added to laboratory control water was also tested to ensure that the treatment itself did not produce adverse effects.

Results and Discussion

The results for *C. dubia* survival are presented in Table 1. There were no effects on survival of *C. dubia* in FR_UFR1 or FR_FRCP1 tested in any quarter with the survival in all samples meeting the performance criteria for a control (i.e., ≥80% survival).

The results for *C. dubia* reproduction are presented in Table 2. Samples collected from FR_FRCP1 exhibited reduced reproduction relative to the reference location and the laboratory control in the first, third, and fourth quarters. In the first and third quarters, EDTA treatment of FR_FRCP1 samples improved reproduction, although not enough to return reproduction to site control levels. This demonstrates that divalent cationic metals may have contributed to the observed adverse effects, but were not the sole cause of toxicity. In the fourth quarter, EDTA treatment of the FR_FRCP1 samples did not improve reproduction. Samples collected from FR_FRCP1 performed similarly to the reference location and the laboratory control in the second quarter.

Results of *H. azteca* tests are summarized in Tables 3 and 4. Survival of *H. azteca* in the FR_FRCP1 samples was comparable to that observed in the upstream reference water, FR_UFR1, and the laboratory control in all quarters tested. Survival for all treatments, in all quarters, ranged from 92 – 98%. However, growth was reduced in the FR_FRCP1 sample in the third quarter relative to FR_UFR1. Treatment of the sample with EDTA did not improve growth.

EDTA treatments conducted in 2021 produced somewhat reduced survival and growth in the EDTA controls in some instances. This includes EDTA controls for *C. dubia* tested in the first, third, and fourth quarter, and the EDTA control for *H. azteca* in the third quarter, which had lower growth than the control. The FR_FRCP1 samples treated with EDTA also exhibited an adverse effect, relative to the untreated FR_FRCP1 sample, in some instances. This includes the EDTA-treated FR_FRCP1 sample *C. dubia* tested in the fourth quarter, which had somewhat reduced reproduction relative to the untreated sample, and the EDTA-treated FR_FRCP1 sample for *H. azteca* in the third quarter, which had lower growth than the untreated sample. These data demonstrate that EDTA itself can produce adverse responses in these toxicity tests, and that the 5 mg/L EDTA treatment is close to a threshold for adverse effects. However, reducing the treatment concentration may result in the treatment becoming insufficient to bind the divalent metals that are present in the sample.

Additional TIE efforts beyond EDTA treatments, may be appropriate to characterize the cause of toxicity during quarterly sampling events in 2022, if observed adverse responses are not effectively treated with EDTA.

Table 1. ***Ceriodaphnia dubia*** **survival (%) in EDTA treatments of samples from FR_FRCP1 and related locations.**

Test initiation	Treatment	Control	FR_UFR1	FR_FRCP1
First quarter 2021

Introduction

Nautilus Environmental conducted chronic toxicity tests in 2021 for Teck Coal Ltd. with samples collected from various locations as part of a quarterly toxicity testing program (permit number 107517). Toxicity testing included:

- *Ceriodaphnia dubia* 7-d survival and reproduction,
- *Pseudokirchneriella subcapitata* 72-h growth inhibition,
- *Hyalella azteca* 28-d survival and growth,
- *Pimephales promelas* 32-d survival and growth and
- *Oncorhynchus mykiss* embryo-alevin development.

Samples collected as part of quarterly monitoring for Teck Coal Ltd. from CM_MC2 have previously exhibited toxicity in chronic toxicity tests using *C. dubia* and *H. azteca*. Consequently, Nautilus Environmental conducted a Toxicity Identification Evaluation (TIE) in order to determine the cause of toxicity. The results of this TIE identified nickel as the most likely cause of adverse effects in samples from this location to both species.

A TIE approach was incorporated into the quarterly testing program using *C. dubia* and *H. azteca*, in order to evaluate the potential role of divalent metal cations as a cause of toxicity. An EDTA treatment was applied to CM_MC2 and RG_MIDAG samples collected in 2021. The results of these test treatments are summarized in this memo.

Methods

TIE treatments involve physico-chemical manipulations of the sample, followed by toxicity tests on the treated and untreated samples to provide information on the cause of toxicity. Treatments are based on general guidance provided by the USEPA for TIEs. The following TIE treatment was performed on the samples:

- **Ethylenediaminetetraacetic acid (EDTA) chelation**: the sample was treated with 5 mg/L EDTA, which is a chelating agent that binds divalent metal cations, such as copper, cadmium, nickel and zinc, and reduces their bioavailability. Thus, a reduction in toxicity following treatment with EDTA indicates that a metal that can be chelated with EDTA may be responsible for toxicity.

Treated and untreated samples were tested concurrently, so that any effect of the treatment could be discerned. A control treatment in which EDTA was added to laboratory control water was also tested to ensure that the treatment itself did not produce adverse effects.

Results and Discussion

The results for *C. dubia* survival are presented in Table 1. There was no affect on survival of *C. dubia* in CM_MC2 or RG_MIDAG samples tested in any quarter with survival for all samples meeting the performance criteria for a control (i.e., ≥80% survival).

The results for *C. dubia* reproduction are presented in Table 2. Samples collected from CM_MC2 exhibited somewhat reduced reproduction relative to the reference water, CM_MC1, and the laboratory control in the first and fourth quarters. In the first quarter, EDTA treatment of CM_MC2 effectively improved reproduction, indicating that divalent cationic metals likely caused the observed adverse effects. In the fourth quarter, EDTA treatment of CM_MC2 also improved reproduction, although not enough to entirely eliminate the adverse response. This demonstrates that divalent cationic metals contributed to the observed adverse effects, but may not be the sole cause of toxicity.

Results of *H. azteca* tests are summarized in Tables 3 and 4 for survival and growth, respectively. Survival and growth of *H. azteca* in the untreated RG_MIDAG samples was comparable to that observed in the upstream reference water, CM_MC1, and the laboratory control in all quarters tested. Reduced survival was observed in the second and third quarter for CM_MC2. In the second quarter, EDTA treatment removed adverse effects on survival indicating that divalent metal cations were likely responsible for the observed toxicity. In the third quarter, EDTA treatment also improved survival but not enough to entirely eliminate the effect. Growth of *H. azteca* in the CM_MC2 sample was reduced relative to the reference water, CM_MC1, and the laboratory control in the third quarter. Treatment of CM_MC2 with EDTA did not improve growth.

EDTA treatments conducted in 2021 resulted in somewhat reduced survival and growth in the EDTA controls in some instances. This includes EDTA controls for *C. dubia* tested in the first, third, and fourth quarter, and the EDTA control for *H. azteca* in the third quarter, which had lower growth than the control. The CM_MC2 and RG_MIDAG samples treated with EDTA also exhibited an adverse effect, relative to their untreated counterpart, in some instances. This includes the EDTA-treated CM_MC2 sample *C. dubia* tested in the second quarter, which had somewhat reduced reproduction relative to the untreated sample, and the EDTA-treated CM_MC2 and RG_MIDAG samples for *H. azteca* in the third quarter, which had lower growth than the untreated samples. These data demonstrate that EDTA itself can produce adverse responses, and that the 5 mg/L EDTA treatment is close to a threshold for adverse effects. However, reducing the treatment concentration may result in the treatment becoming insufficient to bind the divalent metals that are present in the sample.

Additional TIE efforts beyond EDTA treatments, may be appropriate to characterize the cause of toxicity during quarterly sampling events in 2022, if observed adverse responses are not effectively counteracted by EDTA.

5.5 Acute Toxicity Testing Results

The results summarized in this section are for water sampling sites listed in Appendix 2 (Tables 10 to 25) and in Appendix 5 (Tables 5B4, 5C2, and 5C3) in Permit 107517. Results are tabulated in Appendix M and final lab reports are provided in Appendix N.

Acute toxicity results for the locations listed in Appendix 4 for the water treatment facilities (WLC AWTF, EVO SRF, FRO-S, and FRO-N) are summarized and provided in the Annual Water Treatment Performance Report as per Section 4A8 (xi and xii) in Permit 107517.

All quarterly acute toxicity testing requirements were met in 2021 with the exception of CM_PC2 in Q3. This resulted in a noncompliance (missed data) as noted in Section 3.3 of this report.

5.5.1 *Daphnia magna* Test Results

As per Section 6.2 of Permit 107517, effluent is not acutely toxic if it does not cause greater than 50% mortality in a 48-hour *Daphnia magna* single concentration (100%) test. In 2021, 553 *Daphnia magna* single concentration (100%) acute toxicity tests were conducted on samples collected from permitted water sampling sites—none exhibited greater than 50% mortality.

Of the 553 *Daphnia magna* single concentration (100%) acute toxicity test results, there were twenty-nine that exhibited greater than 0% mortality: one test result exhibited 27% mortality (FR_CC1); two test results exhibited 17% mortality (CM_CCPD and CM_CCOFF); two test results exhibited 13% mortality (EV_GC2 and GH_WADE), and twenty-four test results (at eleven different locations) exhibited between 3% and 10% mortality (these were within the negative control performance standard of ≤ 10% for this test procedure). These results are not discussed further in this report.

Teck also conducted 42 *Daphnia magna* LC50 tests in 2021 on samples collected from permitted water sampling sites. Two tests exhibited 10% mortality in the undiluted sample and the rest exhibited 0% mortality. These results are not discussed further in this report.

5.5.2 Rainbow Trout Test Results

As per Section 6.2 of Permit 107517, effluent is not acutely toxic if it does not cause greater than 50% mortality in a 96-hour Rainbow Trout single concentration (100%) test. In 2021, 555 Rainbow Trout single concentration (100%) acute toxicity tests were conducted on samples collected from permitted water sampling sites— one test result exhibited greater than 50% mortality (i.e., a failed test result). The failed test result exhibited 100% mortality and was for a sample collected at the Liverpool Sediment Pond Decant (FR_LP1; E304835) on November 17. This result is discussed in detail in the subsections that follow.

Of the 555 Rainbow Trout single concentration (100%) acute toxicity test results, there were thirty that exhibited greater than 0% mortality but less than 50%: one test result exhibited 20% mortality (EV_GC2) and twenty-nine test results (at twelve different locations) exhibited 10% mortality (these were within the negative control performance standard of ≤ 10% for this test procedure). These results are not discussed further in this report.

Teck also conducted 45 Rainbow Trout LC50 tests in 2021 on samples collected from permitted water sampling sites. Eight tests were conducted on samples collected at FR_LP1 as part of the investigation for the failed toxicity test result noted above—one test result exhibited greater than 50% mortality in the undiluted sample (i.e., a failed test result). This failed test result exhibited 60% mortality in the undiluted sample and was for a sample collected at the Liverpool Sediment Pond Decant (FR_LP1; E304835) on November 24. Two other test results exhibited elevated mortality in the undiluted sample but were not failed test results (November 22: 30% mortality and November 25: 50% mortality). The LC50 test results for FR_LP1 are discussed in detail in the subsections that follow. The rest of the Rainbow Trout LC50 tests conducted in 2021 exhibited 0% mortality in the undiluted sample.

5.5.3 Noncompliant Acute Toxicity Test Result

In response to the noncompliant (i.e., failed) acute toxicity test results for samples collected at FR_LP1 on November 17 and November 24, 2021, Teck followed the requirements of Section 9.2.3 in Permit 107517 and the adaptive management plan response framework with respect to notification, confirmatory testing, corrective actions where possible, and the provision of follow-up test information to regulators and Ktunaxa Nation Council as it became available.

5.5.3.1 Description of Event

An acute toxicity sample collected on November 17, 2021, from the Liverpool Sediment Pond discharge location (FR_LP1; E304835) showed 100% mortality in the 96-hour Rainbow Trout single concentration (100%) test. A sample collected the same day in the Fording River immediately downstream of FR_LP1 (FR_FRDSLP1) showed 40% mortality. As per Section 9.2.3 of Permit 107517, a sample was collected at FR_LP1 on November 22 for a confirmatory LC50 test.

Teck immediately initiated additional (daily) monitoring (water chemistry and acute toxicity) at FR_LP1 and FR_FRDSLP1, followed by investigative sampling of inputs to Liverpool Pond to identify the source of the toxicity. An LC50 Rainbow Trout acute toxicity test conducted on a sample collected November 24 showed 60% mortality in the undiluted sample—a second failed test result. Toxicity results for samples collected from an operational dewatering sump within Swift Pit (FR_IP3) suggested that this was the source of toxicity. Toxicity results associated with this investigation and a map of the sampling locations are provided in Appendix O.

Teck had Nautilus Environmental conduct toxicity identification evaluation (TIE) testing for samples collected on November 22, 24, and 25 at FR_LP1; for a sample collected on November 25 at FR_FRDSLP1; and for samples collected on November 26, 30, and December 1 at FR_IP3. Teck also contracted a qualified professional (Golder, member of WSP) to evaluate all data and laboratory evaluations associated with this investigation.

Operational inputs to Liverpool Pond were stopped on November 26, and the Liverpool discharge gate was closed on November 29. The discharge gate remains closed.

5.5.3.2 Interpretation of Cause

Nautilus Environmental (2022) conducted a toxicity identification evaluation (TIE) to evaluate potential causes of the failed Rainbow Trout tests at FR_LP1. A TIE involves physico-chemical manipulations of

water samples, followed by toxicity tests on the treated and untreated samples, to provide information regarding the cause of toxicity. A TIE could not be conducted on the original November 17 sample due to insufficient volume; therefore, TIEs were conducted on subsequent samples collected from FR_LP1 (November 22, 24, and 25), FR_FRDSLP1 (November 25), and FR_IP3 (November 26, 30, and December 1) (Table 24). The strength of toxicity was reduced in the sampling events subsequent to November 17, but still provided sufficient toxicity signal between November 22 and 25 to warrant a TIE. In addition, nitrite spiking tests were conducted with non-toxic composited samples collected from FR_LP1 on November 27 and 29 (first test) and December 2, 3,4, and 6 (second test).

Acute toxicity tests performed as part of the TIE used 96-h Rainbow Trout single concentration screening tests according to procedures from Environment Canada. TIE treatments included the following:

- chloride addition: a reduction in toxicity following chloride addition would indicate toxicity was due to a compound that is chloride-dependent, such as nitrite.
- pH stabilization: a reduction in toxicity following pH-stabilization would indicate toxicity was due to a compound with pH-dependent characteristics, such as ammonia.
- EDTA addition: ethylenediaminetetraacetic acid (EDTA) is a chelating agent that binds to divalent metal cations. A reduction in toxicity following EDTA treatment would indicate toxicity was due to a metal.
- nitrite additions (spiking series): untreated FR_LP1 samples that were non-toxic were used in a nitrite spiking series to determine the sensitivity of Rainbow Trout to nitrite in site water.

TIE results are presented in Table 24 and Figure 34 and Figure 35. Chloride addition of 25 mg/L and chloride addition in combination with pH-stabilization were generally found to substantially reduce or remove toxicity observed in the untreated samples. The pH-stabilized treatment alone was insufficient to remove toxicity (three tests showed no reduction in toxicity and two tests showed a marginal [20%] reduction in toxicity), whereas the combination of chloride treatment and pH control removed the adverse response. Collectively, the TIE results demonstrated that adding chloride into the samples consistently reduced toxicity of the samples.[29] EDTA treatment increased toxicity in both the FR_LP1 sample and the EDTA-treated negative laboratory control (Nautilus 2022), indicating that the EDTA treatment itself contributed to adverse effects. Based on these findings, and a comparison to effect concentrations published in the literature (see below), Nautilus (2022) concluded that nitrite was primarily responsible for toxicity, but that the presence of unionized ammonia may also have contributed to the adverse effects. The evidence for potential contribution of ammonia and nitrite is discussed below.

The toxicity of ammonia depends on the chemical speciation of ammonia (i.e., the unionized form NH_3 versus the ammonium ion NH_4^+), which varies with temperature and pH (USEPA 1999)[30]; the fraction of unionized ammonia increases as pH and temperature increase. Figure 34 shows the relationship between unionized ammonia and Rainbow Trout percent survival in literature LC50 tests (grey X), TIE

[29] One exception was the FR_LP1 sample collected on November 22 with 15 mg/L chloride; there was no sample remaining with which to confirm this result, and all subsequent treatments that were effective at removing toxicity were performed with 25 mg/L of chloride.

[30] Ammonia speciation also depends on ionic strength, but in fresh water this effect is much smaller than the effects of pH and temperature (USEPA 1999).

tests (open symbols), and the FR_LP1 November 17 and 24 failed toxicity test (filled symbols). Key findings from this figure are as follows:

- Rainbow Trout 96-h LC50 values for unionized ammonia range from 0.09 to 1.9 mg/L as N, with an average of 0.5 mg/L as N (USEPA 2013). Approximately half of the TIE tests had unionized ammonia concentrations below the minimum LC50 value, indicating that ammonia would not be expected to result in acute lethality to Rainbow Trout. In other TIE tests, although unionized ammonia concentrations were above the minimum LC50 in literature tests, there was a lack of correspondence between unionized ammonia and percent survival in TIE tests.
- For the November 17 and 24 samples from FR_LP1, the concentration of unionized ammonia under laboratory conditions (0.1 mg/L as N) was approximately equal to the minimum LC50 reported in USEPA (2013; 0.09 mg/L as N), but the lack of correspondence between unionized ammonia and percent survival makes the contribution from ammonia uncertain. Furthermore, it should be noted that under laboratory testing conditions, the temperature is higher (15°C, per EC 2000 protocol); as the temperature increases, the form of ammonia present in the sample shifted from the ionized form to the more toxic un-ionized form (i.e., from NH_4^+ to NH_3), thereby increasing the concentration of unionized ammonia under lab conditions. Under field conditions, the temperature was lower (2.5°C to 6.1°C); concentrations of unionized ammonia under field conditions (0.05 to 0.06 mg/L as N) were below the minimum Rainbow Trout LC50 value reported in USEPA (2013; 0.09 mg/L as N) and approximately 10 times lower than the average Rainbow Trout LC50 value (0.5 mg/L as N).

In aggregate, the results indicate that ammonia may have contributed to the FR_LP1 test failures, and that the potential contribution from unionized ammonia is an artefact of testing conditions (higher temperature), which causes the fraction of unionized ammonia to increase to an extent that the test results do not represent the actual field conditions. Given that the pH-stabilized treatment alone was insufficient to remove toxicity and that there is no correspondence between survival and ammonia concentrations, ammonia is not expected to be the primary cause of toxicity in these samples.

The toxicity of nitrite is primarily influenced by chloride (BC ENV 2021), although other factors such as fish size and pH have also been shown to influence toxicity (e.g., Russo et al. 1981). Figure 35 (top) shows the relationship between nitrite and percent survival in literature LC50 tests (grey X) and FR_LP1 LC50 tests (blue X). The following equation was used in this section to describe the ameliorating effect of chloride on 96-hour nitrite LC50s published in the literature for Rainbow Trout:

$$Estimated\ 96h\ Rainbow\ Trout\ Nitrite\ LC50\ (mg/L\ as\ N) = (0.57 \times chloride)^{0.82}$$

In FR_LP1 tests, the LC50 at chloride of 5.47 mg/L (2.2 mg/L as N) was approximately equal to the expected LC50 based on literature testing (grey dashed line); this demonstrates reasonable agreement across sources.[31] In the other FR_LP1 test, the LC50 (0.53 mg/L at chloride of 3.94 mg/L) was more than two times below the expected LC50 based on literature testing (grey dashed line). The reason for differences in the FR_LP1 LC50s is not known, but the test at 5.47 mg/L chloride is expected to be a

[31] A factor of two is often used in toxicity literature to represent reasonable agreement between measured and predicted values (e.g., CCME 2018).

more reliable estimate of nitrite toxicity in FR_LP1 water because more fish per test concentration were used[32] and survival in the site control met the acceptability criterion[33].

Figure 35 (bottom) shows the correspondence between nitrite concentrations (as indicated by magnitude[34]) and percent mortality in acute toxicity tests with Rainbow Trout conducted as part of the TIE (open symbols), literature LC50 tests (grey X), FR_LP1 LC50 tests (blue X), and the FR_LP1 November 17 and 24 failed toxicity tests (filled symbols). On this figure, the magnitude of estimated nitrite LC50 is used as the exposure variable so that the modifying effect of chloride is comparable across tests. A magnitude of 1 indicates that the nitrite concentration in the test was equal to the estimated LC50. Key findings from this figure are as follows:

- There is good correspondence between Rainbow Trout survival and nitrite concentrations (as indicated by the magnitude). As the concentration of nitrite increases, percent survival decreases. In TIE tests (open symbols), one exception was identified for the FR_LP1 TIE test with 15 mg/L chloride (blue circle); as discussed earlier, there was no sample remaining with which to confirm this result, and all subsequent samples with FR_LP1 conformed to the overarching pattern.
- In the November 17 and 24 samples from FR_LP1, nitrite concentration were within the range of LC50s reported in literature and FR_LP1 tests. The extent of toxicity in the November 17 sample was somewhat greater than would be expected based on measured concentrations of nitrite, which could indicate another contributor to the adverse response (e.g., ammonia, as discussed above) or simply reflect test variability which is common at concentrations near the LC50 (magnitude of 1).

In aggregate, the TIE results indicate that nitrite was the primary cause of the failed toxicity test.

[32] The 5.47 mg/L chloride test had 10 fish per concentration (in alignment with the EC 2000 protocol) compared to only five fish per concentration in the 3.94 mg/L chloride test. Reduction of the number of fish per test solution results in a loss of the precision of the LC50 (EC 2000); this is demonstrated by the wider confidence intervals for the 3.94 mg/L chloride test (±1.8 times the LC50) compared to the 5.47 mg/L chloride test (±1.2 times the LC50).

[33] The 5.47 mg/L chloride test had 100% survival in the site control. The 3.94 mg/L chloride test had 80% survival in the site control, which is below the EC (2000) test validity criterion of 90%; this makes the 3.94 mg/L chloride test invalid.

[34] Magnitude of LC50 calculated as the nitrite concentration in the test divided by the estimated chloride-dependent LC50.

Table 24. Summary of 96-hour Rainbow Trout TIE results.

Notes: (1) Measured in-house by toxicity testing lab. (2) Measured in site water. (3) Average pH recorded for the duration of the test; used in Nautilus' calculation of unionized ammonia.

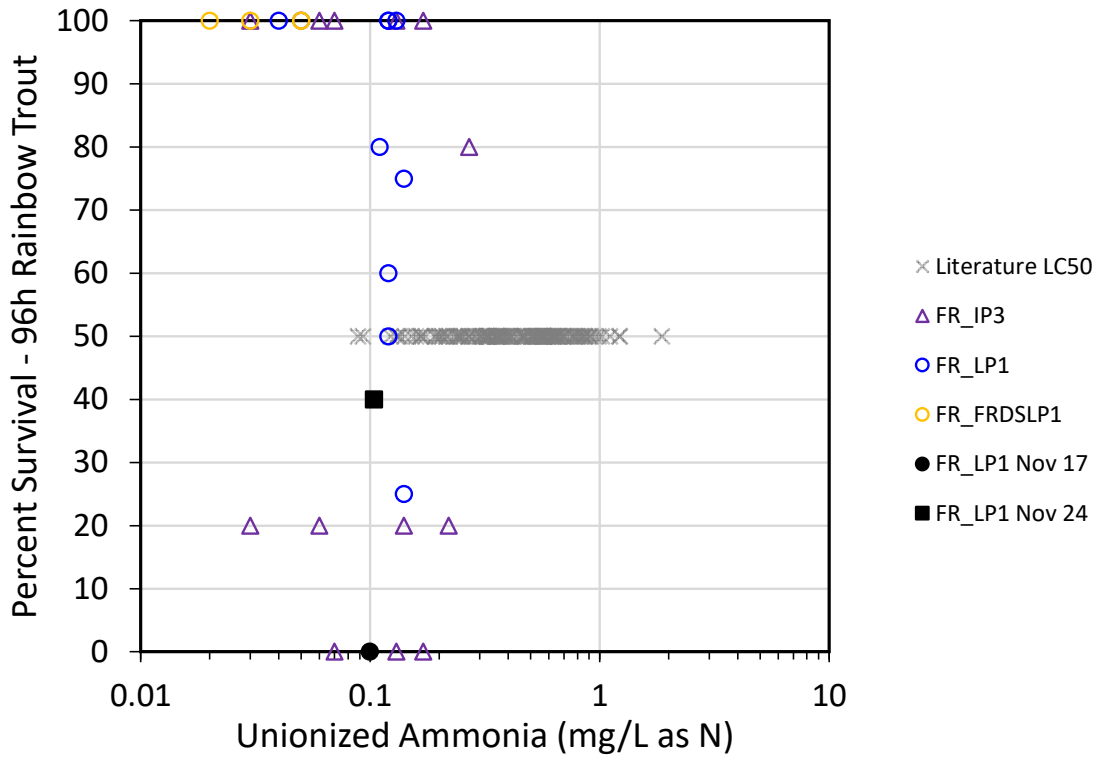

Figure 34. Relationship between unionized ammonia and percent survival in acute toxicity tests conducted with Rainbow Trout.

Notes: Concentrations are in milligrams per litre as nitrogen (mg/L as N). LC50 = concentration associated with 50% lethality in 96-hour tests conducted with Rainbow Trout. TIE = toxicity identification evaluation. Literature LC50s were obtained from US EPA (2013; n = 154). Open symbols (triangles, circles, squares) represent TIE test results from Table 24. Filled symbols indicate the November 17 and 24 samples from FR_LP1 (i.e., the failed toxicity tests).

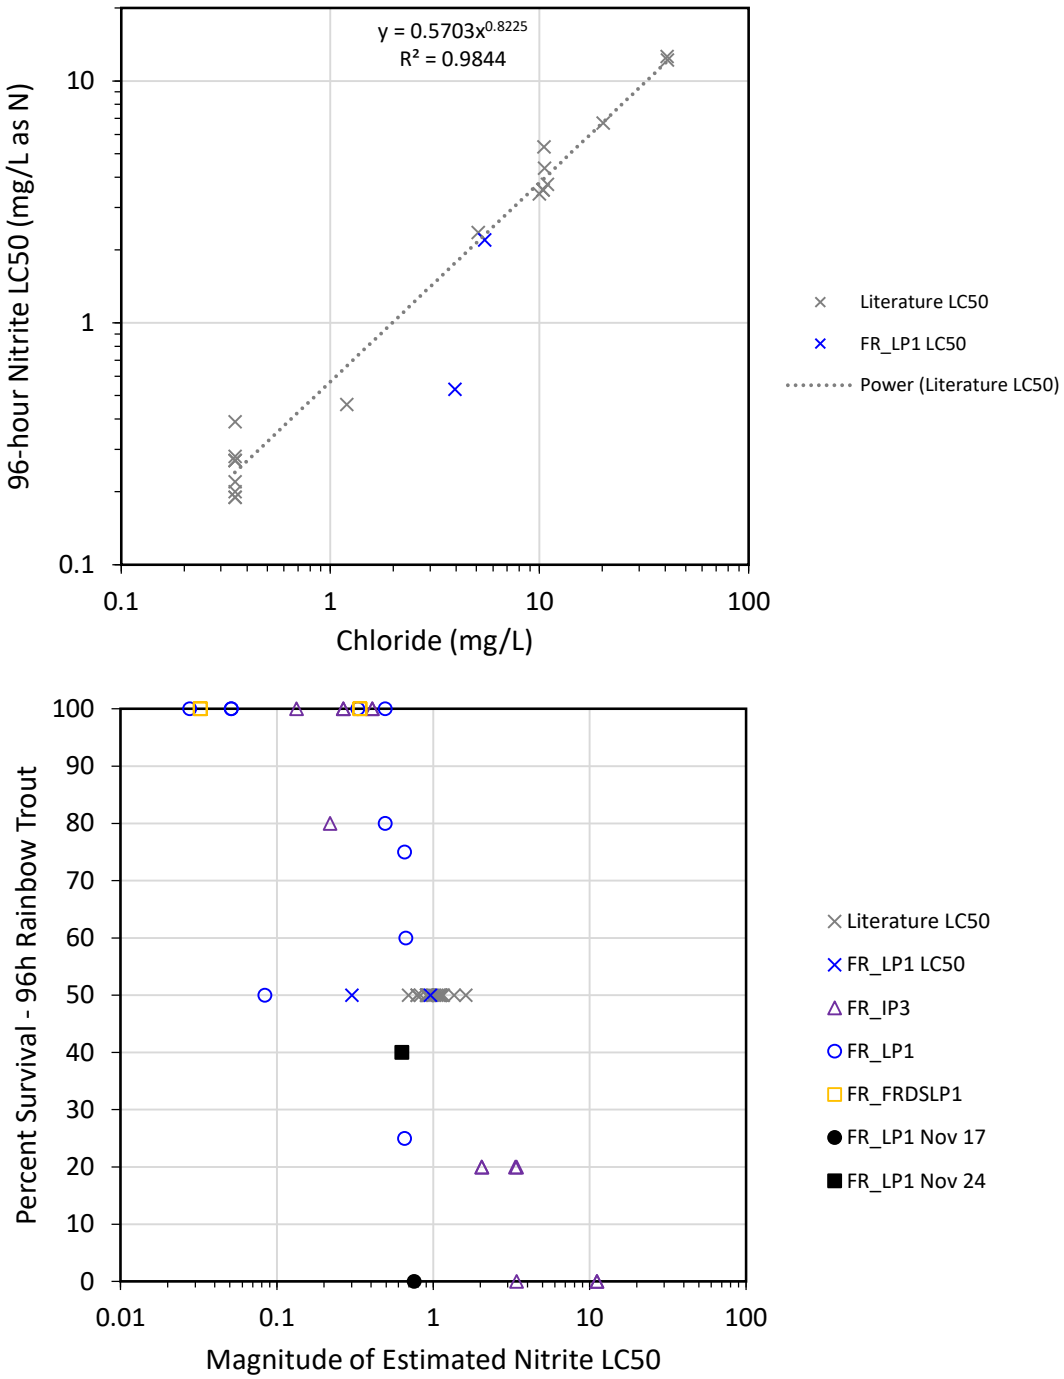

Figure 35. Relationship between chloride and nitrite LC50s for Rainbow Trout (top) or magnitude of estimated nitrite LC50 and percent survival (bottom).

Notes: Concentrations are in milligrams per litre (mg/L) or milligrams per litre as nitrogen (mg/L as N). LC50 = concentration associated with 50% lethality in 96-hour tests conducted with Rainbow Trout. X symbols indicate LC50s obtained from literature (grey) or nitrite spiking tests with FR_LP1 (blue). Literature LC50s were obtained from Russo et al. 1974; Russo and Thurston 1977; Russo et al. 1981; Kroupova et al. 2008 (n = 20). Open symbols (triangles, circles, squares) represent TIE test results from Table 24. Filled symbols indicate the November 17 and 24 samples from FR_LP1 (i.e., the failed toxicity tests). Magnitude of 1 indicates that nitrite concentration is equal to the estimated LC50.

5.5.3.3 Water Quality Screening

The following summarizes the screening results of water quality to British Columbia Water Quality Guidelines (BCWQGs) for the November 17 and 24 FR_LP1 samples that yielded acute toxicity to Rainbow Trout. Constituent concentrations were below BWQGs, with the exception of nitrite, lithium, and selenium.

- Nitrite concentrations in these samples (0.44 to 0.58 mg/L as N) were greater than the short-term BCWQG (0.06 mg/L as N; chloride-dependent). As discussed in the previous section, nitrite concentrations were within the range of Rainbow Trout LC50s reported in the literature and measured as part of the TIE. This screening aligns with the TIE results presented above.
- Lithium concentration in these samples (196 to 228 µg/L) were greater than the long-term probable no-effect concentration derived by ECCC (2018) of 122 µg/L. Currently, there is no approved short-term BCWQG for lithium; however, the lowest 96-hour LC50 for Rainbow Trout reported in Merck (2010, 2018) and Sigma (2021a, b) safety data sheets is 30,300 µg/L, indicating that lithium would not be expected to contribute to acute effects. This screening aligns with the TIE results in that EDTA treatment did not remove toxicity; both lines of evidence indicate that metals did not contribute to the adverse response.
- Selenium concentrations in these samples (7.5 to 8 µg/L) were greater than the long-term chronic BCWQG of 2 µg/L. The long-term chronic BCWQG of for selenium is intended to prevent chronic bioaccumulation of selenium in tissue and not direct acute effects (BC ENV 2014); therefore, selenium concentrations greater than the long-term chronic BCWQG would not be interpreted to cause acute effects. Currently, there is no approved short-term BCWQG for selenium; however, the lowest 96-hour LC_{50} for Rainbow Trout compiled by the US EPA (2004) is 4,200 µg/L selenite and 4,500 µg/L for selenate, indicating that selenium would not be expected to contribute to acute effects. Additionally, selenium concentrations in the November tests that exhibited an acute toxicity test failure were within the range of concentrations in FR_LP1 tests that had no adverse effects.

5.5.3.4 Summary

Investigations of the original test observations and the follow-up TIE testing, combined with water quality evaluations, indicate that nitrite was the probable cause of the November 17 and 24 toxicity test failures. The main lines of evidence in support of this conclusion were:

- Results above the nitrite short-term water quality guideline and toxicological benchmarks for Rainbow Trout survival
- Lack of other constituents with strong potential to elicit the magnitude of responses observed
- Empirical results of TIE treatments in which chloride additions (which reduce nitrite toxicity) demonstrably reduced mortality to Rainbow Trout
- Limited to no efficacy of other TIE treatments in reducing toxicity to Rainbow Trout
- Correspondence between Rainbow Trout survival and nitrite concentrations (as mediated by chloride amendment across a spiking series)

There are indications of possible influence of unionized ammonia in some samples under laboratory test conditions. However, such responses are secondary to the nitrite influences, and may not be relevant to field conditions given the effect of water temperature on ammonia speciation.

5.5.3.5 Description of Actions Taken

Below is a summary of actions taken by Teck in 2021 in response to this event. Teck's response continues in 2022, as do regular and frequent updates to regulators and KNC.

- November 22: Teck reported the failed acute toxicity test to EMBC (DGIR# 213390) upon receiving preliminary results from the lab.
- November 22: Teck collected confirmatory samples (for LC50 and TIE tests) and initiated additional (daily) sampling at FR_LP1 and FR_FRDSLP1. Teck began evaluating mitigation options.
- November 24: Teck notified ENV, EMLI, KNC, and ECCC of the acute toxicity failure.
- November 26: Operational inputs to Liverpool Pond were stopped.
- November 26: Began collecting samples from operational inputs to Liverpool pond to identify the source of the toxicity.
- November 29: Liverpool discharge gate was closed.
- November 30: Preliminary acute toxicity test results suggest mitigation measures were successful in eliminating toxicity in Liverpool Pond.
- December 3: Teck contracted QPs to support the investigation and evaluation of water quality results.
- December 24: Teck submitted the *Swift Water Management Interim EFN Contingency Plan* to regulators and KNC.

During Teck's response to this event, regular and frequent updates were provided to regulators and KNC. These included preliminary and final water quality and acute toxicity results as they became available; updates on how operational water from Swift Pit was being managed; and updates on how EFNs in the Fording River were being managed.

Teck is revising its internal procedure for pit water management plans and is updating its data management tools to help to better identify and pro-actively manage water quality risks associated with our authorized activities.

[a] = guideline is a minimum value, unless the background concentration or value is lower.
[b] = guideline is adopted from CCME Canadian Environmental Quality Guidelines (CCME, 1999).
[c] = guideline is hardness dependent. The guideline range shown is based on the hardness range observed in the dataset (111 to 200 mg/L). The guideline is calculated based on the individual hardness value for each sample.

[d] = for some samples, water hardness was greater than 250 mg/L. At this hardness, no BC ENV water quality guideline has been established for sulphate; however, the observed data were screened against the guideline for very hard water (i.e., 429 mg/L) for comparative purposes.
[e] = guideline is chloride dependent. The guideline range shown is based on the chloride concentration range observed in the dataset (0.050 to 0.610 mg/L). The guideline is calculated based on the individual chloride concentration in each sample.
[f] = guideline is adopted from the ECCC PNECs (ECCC, 2018) or draft FEQGs (ECCC, 2017).
[g] = guideline is for chromium VI.
[h] = guideline is pH dependent. The guideline range shown is based on the pH range observed in the dataset (7.9 to 8.7). The guideline is calculated based on the individual pH for each sample.
[i] = guideline is a level 1 interim screening value.
[j] = dissolved copper guideline was calculated using the simplified Biotic Ligand Model (BC ENV, 2019). Where values were missing, the temporally nearest value from the same location was taken.
[Mn] = concentration is higher than the 30-day mean BC ENV guideline or outside the recommended pH, DO or total alkalinity range.
[Mx] = concentration is higher than the maximum BC ENV guideline or outside the recommended pH, DO or total alkalinity range.
[B] = concentration is higher than the EVWQP benchmarks guideline.
Bolded concentrations are higher than water quality guidelines
Shaded concentrations are higher than the EVWQP benchmark (e.g., for nitrate, total selenium, dissolved cadmium or sulphate).

(a) = guideline is a minimum value, unless the background concentration or value is lower.
(b) = guideline is adopted from CCME Canadian Environmental Quality Guidelines (CCME, 1999).
(c) = guideline is hardness dependent. The guideline range shown is based on the hardness range observed in the dataset (262 to 1,300 mg/L). The guideline is calculated based on the individual hardness value for each sample.
(d) = for some samples, water hardness was greater than 250 mg/L. At this hardness, no BC ENV water quality guideline has been established for sulphate; however, the observed data were screened against the guideline for very hard water (i.e., 429 mg/L) for comparative purposes.
(e) = guideline is chloride dependent. The guideline range shown is based on the chloride concentration range observed in the dataset (0.390 to 4.930 mg/L). The guideline is calculated based on the individual chloride concentration in each sample.
(f) = guideline is adopted from the ECCC PNECs (ECCC, 2018) or draft FEQGs (ECCC, 2017).
(g) = guideline is for chromium VI.
(h) = guideline is pH dependent. The guideline range shown is based on the pH range observed in the dataset (7.7 to 8.4). The guideline is calculated based on the individual pH for each sample.
(i) = guideline is a level 1 interim screening value.
(j) = dissolved copper guideline was calculated using the simplified Biotic Ligand Midel (BC ENV, 2019). Where values were missing, the temporally nearest value from the same location was taken.
(Mn) = concentration is higher than the 30-day mean BC ENV guideline or outside the recommended pH, DO or total alkalinity range.
(Mx) = concentration is higher than the maximum BC ENV guideline or outside the recommended pH, DO or total alkalinity range.
(E) = concentration is higher than the EVWQP benchmarks guideline.
Bolded concentrations are higher than water quality guidelines.
Shaded concentrations are higher than the EVWQP benchmark (e.g., for nitrate, total selenium, dissolved cadmium or sulphate).
Water quality data and guidelines shown in this table were rounded to reflect laboratory or field instrument precision after comparisons to guidelines. Therefore, values slightly above guidelines may be displayed as being equal to the guidelines and identified as exceedances. Concentrations equal to the guideline values were not identified as exceedances.
Concentrations were screened against available Working and Approved British Columbia Ministry of Environment and Climate Change Strategy (BC ENV) Water Quality Guidelines for the Protection of Aquatic Life; Accessed January 2020 from: https://www2.gov.bc.ca/gov/content/environment/air-land-water/water/water-quality/water-quality-guidelines.
- = no guideline or no data
BC ENV = British Columbia Ministry of Environment & Climate Change Strategy; EVWQP = Elk Valley Water Quality Plan guidelines; *C. dubia = Ceriodaphnia dubia* ; *P. subcapitata = Pseudokirchneriella subcapitata* ; *H. azteca = Hyallela azteca* ; *P. promelas = Pimephales promelas* ; *O. mykiss = Oncorhynchus mykiss* ; CV = coefficient of variation; $\sum$ = sum of; WQGs = Water Quality Guidelines; $CaCO3$ = calcium carbonate; mg/L = milligrams per litre; µS/cm = microsiemens per centimeter; NTU = nephelometric turbidity units; meq/L = milliequivalents per litre; mg-N/L = milligrams of Nitrogen per litre; mg-P/L = milligrams of Phosphorus per litre.
BC ENV (B.C. Ministry of Climate Chande Strategy). 2019. Copper Water Quality guideline for the Protection of Aquatic Life-Technical Report. Water Quality Guideline Series, WQG-03-1. Prov. B.C., Victoria B.C.

(a) = guideline is a minimum value, unless the background concentration or value is lower.
(b) = guideline is adopted from CCME Canadian Environmental Quality Guidelines (CCME, 1999).
(c) = guideline is hardness dependent. The guideline range shown is based on the hardness range observed in the dataset (307 to 805 mg/L). The guideline is calculated based on the individual hardness value for each sample.
(d) = for some samples, water hardness was greater than 250 mg/L. At this hardness, no BC ENV water quality guideline has been established for sulphate; however, the observed data were screened against the guideline for very hard water (i.e., 429 mg/L) for comparative purposes.
(e) = guideline is chloride dependent. The guideline range shown is based on the chloride concentration range observed in the dataset (0.6300 to 5.3700 mg/L). The guideline is calculated based on the individual chloride concentration in each sample.
(f) = guideline is adopted from the ECCC PNECs (ECCC, 2018) or draft FEQGs (ECCC, 2017).
(g) = guideline is for chromium VI.
(h) = guideline is pH dependent. The guideline range shown is based on the pH range observed in the dataset (7.9 to 8.4). The guideline is calculated based on the individual pH for each sample.
(i) = guideline is a level 1 interim screening value.
(j) = dissolved copper guideline was calculated using the simplified Biotic Ligand Midel (BC ENV, 2019). Where values were missing, the temporally nearest value from the same location was taken.
(Mn) = concentration is higher than the 30-day mean BC ENV guideline or outside the recommended pH, DO or total alkalinity range.
(Mx) = concentration is higher than the maximum BC ENV guideline or outside the recommended pH, DO or total alkalinity range.
(E) = concentration is higher than the EVWQP benchmarks guideline.
Bolded concentrations are higher than water quality guidelines.
Shaded concentrations are higher than the EVWQP benchmark (e.g., for nitrate, total selenium, dissolved cadmium or sulphate).
Water quality data and guidelines shown in this table were rounded to reflect laboratory or field instrument precision after comparisons to guidelines. Therefore, values slightly above guidelines may be displayed as being equal to the guidelines and identified as exceedances. Concentrations equal to the guideline values were not identified as exceedances.
Concentrations were screened against available Working and Approved British Columbia Ministry of Environment and Climate Change Strategy (BC ENV) Water Quality Guidelines for the Protection of Aquatic Life: Accessed January 2020 from: https://www2.gov.bc.ca/gov/content/environment/air-land-water/water/water-quality/water-quality-guidelines.
- = no guideline or no data
BC ENV = British Columbia Ministry of Environment & Climate Change Strategy; EVWQP = Elk Valley Water Quality Plan guidelines; *C. dubia* = *Ceriodaphnia dubia* ; *P. subcapitata* = *Pseudokirchneriella subcapitata* ; *H. azteca* = *Hyallela azteca* ; *P. promelas* = *Pimephales promelas* ; *O. mykiss* = *Oncorhynchus mykiss* ; CV = coefficient of variation; ∑ = sum of; WQGs = Water Quality Guidelines; CaCO3 = calcium carbonate; mg/L = milligrams per litre; µS/cm = microsiemens per centimeter; NTU = nephelometric turbidity units; meq/L = milliequivalents per litre; mg-N/L = milligrams of Nitrogen per litre; mg=P/L = milligrams of Phosphorus per litre.
BC ENV (B.C. Ministry of Climate Chande Strategy). 2019. Copper Water Quality guideline for the Protection of Aquatic Life-Technical Report. Water Quality Guideline Series, WQG-03-1. Prov. B.C., Victoria B.C.

(a) = guideline is a minimum value, unless the background concentration or value is lower.
(b) = guideline is adopted from CCME Canadian Environmental Quality Guidelines (CCME, 1999).
(c) = guideline is hardness dependent. The guideline range shown is based on the hardness range observed in the dataset (256 to 628 mg/L). The guideline is calculated based on the individual hardness value for each sample.

(d) = for some samples, water hardness was greater than 250 mg/L. At this hardness, no BC ENV water quality guideline has been established for sulphate; however, the observed data were screened against the guideline for very hard water (i.e., 429 mg/L) for comparative purposes.
(e) = guideline is chloride dependent. The guideline range shown is based on the chloride concentration range observed in the dataset (0.680 to 3.310 mg/L). The guideline is calculated based on the individual chloride concentration in each sample.
(f) = guideline is adopted from the ECCC PNECs (ECCC, 2018) or draft FEQGs (ECCC, 2017).
(g) = guideline is for chromium VI.
(h) = guideline is pH dependent. The guideline range shown is based on the pH range observed in the dataset (8.0 to 8.7). The guideline is calculated based on the individual pH for each sample.
(i) = guideline is a level 1 interim screening value.
(j) = dissolved copper guideline was calculated using the simplified Biotic Ligand Midel (BC ENV, 2019). Where values were missing, the temporally nearest value from the same location was taken.
(Mn) = concentration is higher than the 30-day mean BC ENV guideline or outside the recommended pH, DO or total alkalinity range.
(Mx) = concentration is higher than the maximum BC ENV guideline or outside the recommended pH, DO or total alkalinity range.
(E) = concentration is higher than the EVWQP benchmarks guideline.
Bolded concentrations are higher than water quality guidelines.
Shaded concentrations are higher than the EVWQP benchmark (e.g., for nitrate, total selenium, dissolved cadmium or sulphate).
Water quality data and guidelines shown in this table were rounded to reflect laboratory or field instrument precision after comparisons to guidelines. Therefore, values slightly above guidelines may be displayed as being equal to the guidelines and identified as exceedances. Concentrations equal to the guideline values were not identified as exceedances.
Concentrations were screened against available Working and Approved British Columbia Ministry of Environment and Climate Change Strategy (BC ENV) Water Quality Guidelines for the Protection of Aquatic Life; Accessed January 2020 from: https://www2.gov.bc.ca/gov/content/environment/air-land-water/water/water-quality/water-quality-guidelines.
- = no guideline or no data
BC ENV = British Columbia Ministry of Environment & Climate Change Strategy; EVWQP = Elk Valley Water Quality Plan guidelines; *C. dubia = Ceriodaphnia dubia* ; *P. subcapitata = Pseudokirchneriella subcapitata* ; *H. azteca = Hyalella azteca* ; *P. promelas = Pimephales promelas* ; *O. mykiss = Oncorhynchus mykiss* ; CV = coefficient of variation; ∑ = sum of; WQGs = Water Quality Guidelines; CaCO3 = calcium carbonate; mg/L = milligrams per litre; µS/cm = microsiemens per centimeter; NTU = nephelometric turbidity units; meq/L = milliequivalents per litre; mg-N/L = milligrams of Nitrogen per litre; mg=P/L = milligrams of Phosphorus per litre.

(a) = guideline is a minimum value, unless the background concentration or value is lower.
(b) = guideline is adopted from CCME Canadian Environmental Quality Guidelines (CCME, 1999).
(c) = guideline is hardness dependent. The guideline range shown is based on the hardness range observed in the dataset (245 to 536 mg/L). The guideline is calculated based on the individual hardness value for each sample.

(d) = for some samples, water hardness was greater than 250 mg/L. At this hardness, no BC ENV water quality guideline has been established for sulphate; however, the observed data were screened against the guideline for very hard water (i.e., 429 mg/L) for comparative purposes.
(e) = guideline is chloride dependent. The guideline range shown is based on the chloride concentration range observed in the dataset (1.330 to 6,270 mg/L). The guideline is calculated based on the individual chloride concentration in each sample.
(f) = guideline is adopted from the ECCC PNECs (ECCC, 2018) or draft FEQGs (ECCC, 2017).
(g) = guideline is for chromium VI.
(h) = guideline is pH dependent. The guideline range shown is based on the pH range observed in the dataset (8.2 to 8.7). The guideline is calculated based on the individual pH for each sample.
(i) = guideline is a level 1 interim screening value.
(j) = dissolved copper guideline was calculated using the simplified Biotic Ligand Midel (BC ENV, 2019). Where values were missing, the temporally nearest value from the same location was taken.
(Mn) = concentration is higher than the 30-day mean BC ENV guideline or outside the recommended pH, DO or total alkalinity range.
(Mx) = concentration is higher than the maximum BC ENV guideline or outside the recommended pH, DO or total alkalinity range.
(E) = concentration is higher than the EVWQP benchmarks guideline.
Bolded concentrations are higher than water quality guidelines.
Shaded concentrations are higher than the EVWQP benchmark (e.g., for nitrate, total selenium, dissolved cadmium or sulphate).
Water quality data and guidelines shown in this table were rounded to reflect laboratory or field instrument precision after comparisons to guidelines. Therefore, values slighlty above guidelines may be displayed as being equal to the guidelines and identified as exceedances. Concentrations equal to the guideline values were not identified as exceedances.
Concentrations were screened against available Working and Approved British Columbia Ministry of Environment and Climate Change Strategy (BC ENV) Water Quality Guidelines for the Protection of Aquatic Life; Accessed January 2020 from: https://www2.gov.bc.ca/gov/content/environment/air-land-water/water/water-quality/water-quality-guidelines.
- = no guideline or no data
BC ENV = British Columbia Ministry of Environment & Climate Change Strategy; EVWQP = Elk Valley Water Quality Plan guidelines; *C. dubia* = *Ceriodaphnia dubia* ; *P. subcapitata* = *Pseudokirchneriella subcapitata* ; *H. azteca* = *Hyalella azteca* ; *P. promelas* = *Pimephales promelas* ; *O. mykiss* = *Oncorhynchus mykiss* ; CV = coefficient of variation; ∑ = sum of; WQGs = Water Quality Guidelines; CaCO3 = calcium carbonate; mg/L = milligrams per litre; µS/cm = microsiemens per centimeter; NTU = nephelometric turbidity units; meq/L = milliequivalents per litre; mg-N/L = milligrams of Nitrogen per litre; mg-P/L = milligrams of Phosphorus per litre.
BC ENV (B.C. Ministry of Climate Chande Strategy). 2019. Copper Water Quality guideline for the Protection of Aquatic Life-Technical Report. Water Quality Guideline Series, WQG-03-1. Prov. B.C., Victoria B.C.

(a) = guideline is a minimum value, unless the background concentration or value is lower.
(b) = guideline is adopted from CCME Canadian Environmental Quality Guidelines (CCME, 1999).
(b) = guideline is hardness dependent. The guideline range shown is based on the hardness range observed in the dataset (207 to 600 mg/L). The guideline is calculated based on the individual hardness value for each sample.
(c) = for some samples, water hardness was greater than 250 mg/L. At this hardness, no BC ENV water quality guideline has been established for sulphate; however, the observed data were screened against the guideline for very hard water (i.e., 429 mg/L) for comparative purposes.
(d) = guideline is pH dependent. The guideline range shown is based on the pH range observed in the dataset (7.9 to 8.4). The guideline is calculated based on the individual pH for each sample.
(e) = guideline is chloride dependent. The guideline range shown is based on the chloride concentration range observed in the dataset (3.8600 to 22.0000 mg/L). The guideline is calculated based on the individual chloride concentration in each sample.
(f) = guideline is adopted from the ECCC PNECs (ECCC, 2018) or draft FEQGs (ECCC, 2017).
(g) = guideline is for chromium VI.
(h) = guideline is a level 1 interim screening value.
(i) = dissolved copper guideline was calculated using the simplified Biotic Ligand Midel (BC ENV, 2019). Where values were missing, the temporally nearest value from the same location was taken.
(Mn) = concentration is higher than the 30-day mean BC ENV guideline or outside the recommended pH, DO or total alkalinity range.
(Mx) = concentration is higher than the maximum BC ENV guideline or outside the recommended pH, DO or total alkalinity range.
(E) = concentration is higher than the EVWQP benchmarks guideline.
Bolded concentrations are higher than water quality guidelines.
Shaded concentrations are higher than the EVWQP benchmark (e.g., for nitrate, total selenium, dissolved cadmium or sulphate).
Water quality data and guidelines shown in this table were rounded to reflect laboratory or field instrument precision after comparisons to guidelines. Therefore, values slighlty above guidelines may be displayed as being equal to the guidelines and identified as exceedances.
Concentrations equal to the guideline values were not identified as exceedances.
Concentrations were screened against available Working and Approved British Columbia Ministry of Environment and Climate Change Strategy (BC ENV) Water Quality Guidelines for the Protection of Aquatic Life; Accessed January 2020 from: https://www2.gov.bc.ca/gov/content/environment/air-land-water/water/water-quality/water-quality-guidelines.
- = no guideline or no data
BC ENV = British Columbia Ministry of Environment & Climate Change Strategy; EVWQP = Elk Valley Water Quality Plan guidelines; *C. dubia* = *Ceriodaphnia dubia* ; *P. subcapitata* = *Pseudokirchneriella subcapitata* ; *H. azteca* = *Hyalella azteca* ; *P. promelas* = *Pimephales promelas* ; *O. mykiss* = *Oncorhynchus mykiss* ; CV = coefficient of variation; ∑ = sum of. WQGs = Water Quality Guidelines; CaCO3 = calcium carbonate; mg/L = milligrams per litre; µS/cm = microsiemens per centimeter; NTU = nephelometric turbidity units; meq/L = milliequivalents per litre; mg-N/L = milligrams of Nitrogen per litre; mg-P/L = milligrams of Phosphorus per litre.
BC ENV (B.C. Ministry of Climate Chande Strategy). 2019. Copper Water Quality guideline for the Protection of Aquatic Life-Technical Report. Water Quality Guideline Series, WQG-03-1. Prov. B.C., Victoria B.C.

(a) = guideline is a minimum value, unless the background concentration or value is lower.
(b) = guideline is adopted from CCME Canadian Environmental Quality Guidelines (CCME, 1999).
(c) = guideline is hardness dependent. The guideline range shown is based on the hardness range observed in the dataset (137 to 189 mg/L). The guideline is calculated based on the individual hardness value for each sample.
(d) = for some samples, water hardness was greater than 250 mg/L. At this hardness, no BC ENV water quality guideline has been established for sulphate; however, the observed data were screened against the guideline for very hard water (i.e., 429 mg/L) for comparative purposes.
(e) = guideline is chloride dependent. The guideline range shown is based on the chloride concentration range observed in the dataset (0.200 to 0.570 mg/L). The guideline is calculated based on the individual chloride concentration in each sample.
(f) = guideline is adopted from the ECCC PNECs (ECCC, 2018) or draft FEQGs (ECCC, 2017).
(g) = guideline is for chromium VI.
(h) = guideline is pH dependent. The guideline range shown is based on the pH range observed in the dataset (7.7 to 8.5). The guideline is calculated based on the individual pH for each sample.
(i) = guideline is a level 1 interim screening value.
(j) = dissolved copper guideline was calculated using the simplified Biotic Ligand Midel (BC ENV, 2019). Where values were missing, the temporally nearest value from the same location was taken.
(Mn) = concentration is higher than the 30-day mean BC ENV guideline or outside the recommended pH, DO or total alkalinity range.
(Mx) = concentration is higher than the maximum BC ENV guideline or outside the recommended pH, DO or total alkalinity range.
(E) = concentration is higher than the EVWQP benchmarks guideline.
Bolded concentrations are higher than water quality guidelines.
Shaded concentrations are higher than the EVWQP benchmark (e.g., for nitrate, total selenium, dissolved cadmium or sulphate).
Water quality data and guidelines shown in this table were rounded to reflect laboratory or field instrument precision after comparisons to guidelines. Therefore, values slightly above guidelines may be displayed as being equal to the guidelines and identified as exceedances.
Concentrations equal to the guideline values were not identified as exceedances.
Concentrations were screened against available Working and Approved British Columbia Ministry of Environment and Climate Change Strategy (BC ENV) Water Quality Guidelines for the Protection of Aquatic Life; Accessed January 2020 from: https://www2.gov.bc.ca/gov/content/environment/air-land-water/water/water-quality/water-quality-guidelines.
- = no guideline or no data
BC ENV = British Columbia Ministry of Environment & Climate Change Strategy; EVWQP = Elk Valley Water Quality Plan guidelines; *C. dubia* = *Ceriodaphnia dubia* ; *P. subcapitata* = *Pseudokirchneriella subcapitata* ; *H. azteca* = *Hyalella azteca* ; *P. promelas* = *Pimephales promelas* ; *O. mykiss* = *Oncorhynchus mykiss* ; CV = coefficient of variation; ∑ = sum of. WQGs = Water Quality Guidelines; CaCO3 = calcium carbonate; mg/L = milligrams per litre; µS/cm = microsiemens per centimeter; NTU = nephelometric turbidity units; meq/L = milliequivalents per litre; mg-N/L = milligrams of Nitrogen per litre; mg-P/L = milligrams of Phosphorus per litre.
BC ENV (B.C. Ministry of Climate Chande Strategy). 2019. Copper Water Quality guideline for the Protection of Aquatic Life-Technical Report. Water Quality Guideline Series, WQG-03-1. Prov. B.C., Victoria B.C.

(a) = guideline is a minimum value, unless the background concentration or value is lower.
(b) = guideline is adopted from CCME Canadian Environmental Quality Guidelines (CCME, 1999).

(c) = guideline is hardness dependent. The guideline range shown is based on the hardness range observed in the dataset (138 to 201 mg/L). The guideline is calculated based on the individual hardness value for each sample.

(d) = for some samples, water hardness was greater than 250 mg/L. At this hardness, no BC ENV water quality guideline has been established for sulphate; however, the observed data were screened against the guideline for very hard water (i.e., 429 mg/L) for comparative purposes.
(e) = guideline is chloride dependent. The guideline range shown is based on the chloride concentration range observed in the dataset (0.1700 to 0.6400 mg/L). The guideline is calculated based on the individual chloride concentration in each sample.
(f) = guideline is adopted from the ECCC PNECs (ECCC, 2018) or draft FEQGs (ECCC, 2017).
(g) = guideline is for chromium VI.
(h) = guideline is pH dependent. The guideline range shown is based on the pH range observed in the dataset (7.7 to 8.4). The guideline is calculated ba
(i) = guideline is a level 1 interim screening value.
(j) = dissolved copper guideline was calculated using the simplified Biotic Ligand Midel (BC ENV, 2019). Where values were missing, the temporally near
(Mn) = concentration is higher than the 30-day mean BC ENV guideline or outside the recommended pH, DO or total alkalinity range.
(Mx) = concentration is higher than the maximum BC ENV guideline or outside the recommended pH, DO or total alkalinity range.
(E) = concentration is higher than the EVWQP benchmarks guideline.
Bolded concentrations are higher than water quality guidelines.
Shaded concentrations are higher than the EVWQP benchmark (e.g., for nitrate, total selenium, dissolved cadmium or sulphate).
Water quality data and guidelines shown in this table were rounded to reflect laboratory or field instrument precision after comparisons to guidelines. Therefore, values slightly above guidelines may be displayed as being equal to the guidelines and identified as exceedances. Concentrations equal to the guideline values were not identified as exceedances.
Concentrations were screened against available Working and Approved British Columbia Ministry of Environment and Climate Change Strategy (BC ENV) Water Quality Guidelines for the Protection of Aquatic Life; Accessed January 2020 from: https://www2.gov.bc.ca/gov/content/environment/air-land-water/water/water-quality/water-quality-guidelines.
- = no guideline or no data
BC ENV = British Columbia Ministry of Environment & Climate Change Strategy; EVWQP = Elk Valley Water Quality Plan guidelines; *C. dubia = Ceriodaphnia dubia* ; *P. subcapitata = Pseudokirchneriella subcapitata* ; *H. azteca = Hyalella azteca* ; *P. promelas = Pimephales promelas* ; *O. mykiss = Oncorhynchus mykiss* ; CV = coefficient of variation; ∑ = sum of; WQGs = Water Quality Guidelines; CaCO3 = calcium carbonate; mg/L = milligrams per litre; µS/cm = microsiemens per centimeter; NTU = nephelometric turbidity units; meq/L = milliequivalents per litre; mg-N/L = milligrams of Nitrogen per litre; mg-P/L = milligrams of Phosphorus per litre.
BC ENV (B.C. Ministry of Climate Chande Strategy). 2019. Copper Water Quality guideline for the Protection of Aquatic Life-Technical Report. Water Quality Guideline Series, WQG-03-1. Prov. B.C., Victoria B.C.

(a) = guideline is a minimum value, unless the background concentration or value is lower.

(b) = guideline is adopted from CCME Canadian Environmental Quality Guidelines (CCME, 1999).

(c) = guideline is hardness dependent. The guideline range shown is based on the hardness range observed in the datase guideline is calculated based on the individual hardness value for each sample.

(d) = guideline is chloride dependent. The guideline range shown is based on the chloride concentration range observed ir 0.75 mg/L). The guideline is calculated based on the individual chloride concentration in each sample.

(e) = guideline is adopted from the ECCC PNECs (ECCC, 2018) or draft FEQGs (ECCC, 2017).

(f) = guideline is for chromium VI.

(g) = guideline is pH-dependent. The guideline range shown is based on the pH range observed in the dataset (6.8 to 8.6). calculated based on the individual pH for each sample.

(h) = guideline is a level 1 interim screening value.

(i) = dissolved copper guideline was calculated using the simplified Biotic Ligand Midel (BC ENV, 2019). Where values wer temporally nearest value from the same location was taken.

(Mn) = concentration is higher than the 30-day mean water quality guideline or outside the recommended pH, DO or total a

(Mx) = concentration is higher than the maximum water quality guideline or outside the recommended pH, DO or total alka

(E) = concentration is higher than the EVWQP benchmarks guideline.

Bolded concentrations are higher than water quality guidelines.

Shaded concentrations are higher than the EVWQP benchmark (e.g., for nitrate, total selenium, dissolved cadmium or sulp

Water quality data and guidelines shown in this table were rounded to reflect laboratory or field instrument precision after c guidelines. Therefore, values slightly above guidelines may be displayed as being equal to the guidelines and identified as Concentrations equal to the guideline values were not identified as exceedances.

Concentrations were screened against available Working and Approved British Columbia Ministry of Environment and Clim (BC ENV) Water Quality Guidelines for the Protection of Aquatic Life. Accessed January 2020 from: https://www2.gov.bc.ca/gov/content/environment/air-land-water/water/water-quality/water-quality-guidelines.

- = no guideline or no data

BC ENV = British Columbia Ministry of Environment & Climate Change Strategy; EVWQP = Elk Valley Water Quality Plan

(a) = guideline is a minimum value, unless the background concentration or value is lower.
(b) = guideline is adopted from CCME Canadian Environmental Quality Guidelines (CCME, 1999).
(c) = guideline is hardness dependent. The guideline range shown is based on the hardness range observed in the dataset (0.3 to 384 mg/L). The guideline is calculated based on the individual hardness value for each sample.
(d) = for some samples, water hardness was greater than 250 mg/L. At this hardness, no BC ENV water quality guideline has been established for sulphate; however, the observed data were screened against the guideline for very hard water (i.e., 429 mg/L) for comparative purposes.
(e) = guideline is chloride dependent. The guideline range shown is based on the chloride concentration range observed in the dataset (0.0500 to 9.9900 mg/L). The guideline is calculated based on the individual chloride concentration in each sample.
(f) = guideline is adopted from the ECCC PNECs (ECCC, 2018) or draft FEQGs (ECCC, 2017).
(g) = guideline is for chromium VI.
(h) = guideline is pH dependent. The guideline range shown is based on the pH range observed in the dataset (4.8 to 8.4). The guideline is calculated based on the individual pH for each sample.
(i) = guideline is a level 1 interim screening value.
(j) = dissolved copper guideline was calculated using the simplified Biotic Ligand Midel (BC ENV, 2019). Where values were missing, the temporally nearest value from the same location was taken.
(Mn) = concentration is higher than the 30-day mean BC ENV guideline or outside the recommended pH, DO or total alkalinity range.
(Mx) = concentration is higher than the maximum BC ENV guideline or outside the recommended pH, DO or total alkalinity range.
(E) = concentration is higher than the EVWQP benchmarks guideline.
Bolded concentrations are higher than water quality guidelines.
Shaded concentrations are higher than the EVWQP benchmark (e.g., for nitrate, total selenium, dissolved cadmium or sulphate).
(DL>Mn) = analytical detection limit is higher than the 30-day mean BC ENV guideline.
(DL>E) = analytical detection limit is higher than the EVWQP benchmarks guideline.
Water quality data and guidelines shown in this table were rounded to reflect laboratory or field instrument precision after comparisons to guidelines. Therefore, values slightly above guidelines may be displayed as being equal to the guidelines and identified as exceedances. Concentrations equal to the guideline values were not identified as exceedances.
Concentrations were screened against available Working and Approved British Columbia Ministry of Environment and Climate Change Strategy (BC ENV) Water Quality Guidelines for the Protection of Aquatic Life; Accessed January 2020 from: https://www2.gov.bc.ca/gov/content/environment/air-land-water/water/water-quality/water-quality-guidelines.
- = no guideline or no data
BC ENV = British Columbia Ministry of Environment & Climate Change Strategy; EVWQP = Elk Valley Water Quality Plan guidelines; *C. dubia* = *Ceriodaphnia dubia* ; *P. subcapitata* = *Pseudokirchneriella subcapitata* ; *H. azteca* = *Hyalella azteca* ; *P. promelas* = *Pimephales promelas* ; *O. mykiss* = *Oncorhynchus mykiss* ; CV = coefficient of variation; ∑ = sum of; WQGs = Water Quality Guidelines; CaCO3 = calcium carbonate; mg/L = milligrams per litre; µS/cm = microsiemens per centimeter; NTU = nephelometric turbidity units; meq/L = milliequivalents per litre; mg-N/L = milligrams of Nitrogen per litre; mg-P/L = milligrams of Phosphorus per litre.
BC ENV (B.C. Ministry of Climate Chande Strategy). 2019. Copper Water Quality guideline for the Protection of Aquatic Life-Technical Report. Water Quality Guideline Series, WQG-03-1. Prov. B.C., Victoria B.C.

(a) = guideline is a minimum value, unless the background concentration or value is lower.
(b) = guideline is adopted from CCME Canadian Environmental Quality Guidelines (CCME, 1999).

(c) = guideline is hardness dependent. The guideline range shown is based on the hardness range observed in the dataset (219 to 451 mg/L). The guideline is calculated based on the individual hardness value for each sample.

(d) = for some samples, water hardness was greater than 250 mg/L. At this hardness, no BC ENV water quality guideline has been established for sulphate; however, the observed data were screened against the guideline for very hard water (i.e., 429 mg/L) for comparative purposes.

(e) = guideline is chloride dependent. The guideline range shown is based on the chloride concentration range observed in the dataset (1.2500 to 1.5600 mg/L). The guideline is calculated based on the individual chloride concentration in each sample.
(f) = guideline is adopted from the ECCC PNECs (ECCC, 2018) or draft FEQGs (ECCC, 2017).
(g) = guideline is for chromium VI.

(h) = guideline is pH dependent. The guideline range shown is based on the pH range observed in the dataset (8.0 to 8.4). The guideline is calculated based on the individual pH for each sample.
(i) = guideline is a level 1 interim screening value.

(j) = dissolved copper guideline was calculated using the simplified Biotic Ligand Midel (BC ENV, 2019). Where values were missing, the temporally nearest value from the same location was taken.
(Mn) = concentration is higher than the 30-day mean BC ENV guideline or outside the recommended pH, DO or total alkalinity range.
(Mx) = concentration is higher than the maximum BC ENV guideline or outside the recommended pH, DO or total alkalinity range.
(E) = concentration is higher than the EVWQP benchmarks guideline.
Bolded concentrations are higher than water quality guidelines.
Shaded concentrations are higher than the EVWQP benchmark (e.g., for nitrate, total selenium, dissolved cadmium or sulphate).
Water quality data and guidelines shown in this table were rounded to reflect laboratory or field instrument precision after comparisons to guidelines. Therefore, values slightly above guidelines may be displayed as being equal to the guidelines and identified as exceedances. Concentrations equal to the guideline values were not identified as exceedances.
Concentrations were screened against available Working and Approved British Columbia Ministry of Environment and Climate Change Strategy (BC ENV) Water Quality Guidelines for the Protection of Aquatic Life; Accessed January 2020 from: https://www2.gov.bc.ca/gov/content/environment/air-land-water/water/water-quality/water-quality-guidelines.
- = no guideline or no data
BC ENV = British Columbia Ministry of Environment & Climate Change Strategy; EVWQP = Elk Valley Water Quality Plan guidelines; *C. dubia* = *Ceriodaphnia dubia* ; *P. subcapitata* = *Pseudokirchneriella subcapitata* ; *H. azteca* = *Hyalella azteca* ; *P. promelas* = *Pimephales promelas* ; *O. mykiss* = *Oncorhynchus mykiss* ; CV = coefficient of variation;∑ = sum of; WQGs = Water Quality Guidelines; CaCO3 = calcium carbonate; mg/L = milligrams per litre; µS/cm = microsiemens per centimeter; NTU = nephelometric turbidity units; meq/L = milliequivalents per litre; mg-N/L = milligrams of Nitrogen per litre; mg-P/L = milligrams of Phosphorus per litre.
BC ENV (B.C. Ministry of Climate Chande Strategy). 2019. Copper Water Quality guideline for the Protection of Aquatic Life-Technical Report. Water Quality Guideline Series, WQG-03-1. Prov. B.C., Victoria B.C.

(a) = guideline is a minimum value, unless the background concentration or value is lower.
(b) = guideline is adopted from CCME Canadian Environmental Quality Guidelines (CCME, 1999).
(c) = guideline is hardness dependent. The guideline range shown is based on the hardness range observed in the dataset (107 to 240 mg/L). The guideline is calculated based on the individual hardness value for each sample.
(d) = for some samples, water hardness was greater than 250 mg/L. At this hardness, no BC ENV water quality guideline has been established for sulphate; however, the observed data were screened against the guideline for very hard water (i.e., 429 mg/L) for comparative purposes.
(e) = guideline is pH dependent. The guideline range shown is based on the pH range observed in the dataset (7.3 to 8.4). The guideline is calculated based on the individual pH for each sample.
(f) = guideline is chloride dependent. The guideline range shown is based on the chloride concentration range observed in the dataset (0.1000 to 0.7700 mg/L). The guideline is calculated based on the individual chloride concentration in each sample.
(g) = guideline is adopted from the ECCC PNECs (ECCC, 2018) or draft FEQGs (ECCC, 2017).
(h) = guideline is for chromium VI.
(i) = guideline is a level 1 interim screening value.
(j) = dissolved copper guideline was calculated using the simplified Biotic Ligand Midel (BC ENV, 2019). Where values were missing, the temporally nearest value from the same location was taken.
(Mn) = concentration is higher than the 30-day mean BC ENV guideline or outside the recommended pH, DO or total alkalinity range.
(Mx) = concentration is higher than the maximum BC ENV guideline or outside the recommended pH, DO or total alkalinity range.
(E) = concentration is higher than the EVWQP benchmarks guideline.
Bolded concentrations are higher than water quality guidelines.
Shaded concentrations are higher than the EVWQP benchmark (e.g., for nitrate, total selenium, dissolved cadmium or sulphate).
Water quality data and guidelines shown in this table were rounded to reflect laboratory or field instrument precision after comparisons to guidelines. Therefore, values slightly above guidelines may be displayed as being equal to the guidelines and identified as exceedances. Concentrations equal to the guideline values were not identified as exceedances.
Concentrations were screened against available Working and Approved British Columbia Ministry of Environment and Climate Change Strategy (BC ENV) Water Quality Guidelines for the Protection of Aquatic Life; Accessed January 2020 from: https://www2.gov.bc.ca/gov/content/environment/air-land-water/water/water-quality/water-quality-guidelines.
-- = no guideline or no data
BC ENV = British Columbia Ministry of Environment & Climate Change Strategy; EVWQP = Elk Valley Water Quality Plan guidelines; *C. dubia* = *Ceriodaphnia dubia* ; *P. subcapitata* = *Pseudokirchneriella subcapitata* ; *H. azteca* = *Hyalella azteca* ; *P. promelas* = *Pimephales promelas* ; *O. mykiss* = *Oncorhynchus mykiss* ; CV = coefficient of variation; $\sum$ = sum of; WQGs = Water Quality Guidelines; CaCO3 = calcium carbonate; mg/L = milligrams per litre; µS/cm = microsiemens per centimeter; NTU = nephelometric turbidity units; meq/L = milliequivalents per litre; mg-N/L = milligrams of Nitrogen per litre; mg-P/L = milligrams of Phosphorus per litre. BC ENV (B.C. Ministry of Climate Chande Strategy). 2019. Copper Water Quality guideline for the Protection of Aquatic Life-Technical Report. Water Quality Guideline Series, WQG-03-1. Prov. B.C., Victoria B.C.

(a) = guideline is a minimum value, unless the background concentration or value is lower.
(b) = guideline is adopted from CCME Canadian Environmental Quality Guidelines (CCME, 1999).
(c) = guideline is hardness dependent. The guideline range shown is based on the hardness range observed in the dataset (308 to 849 mg/L). The guideline is calculated based on the individual hardness value for each sample.
(d) = for some samples, water hardness was greater than 250 mg/L. At this hardness, no BC ENV water quality guideline has been established for sulphate; however, the observed data were screened against the guideline for very hard water (i.e., 429 mg/L) for comparative purposes.
(e) = guideline is pH dependent. The guideline range shown is based on the pH range observed in the dataset (7.5 to 8.0). The guideline is calculated based on the individual pH for each sample.
(f) = guideline is chloride dependent. The guideline range shown is based on the chloride concentration range observed in the dataset (3.6300 to 70.5000 mg/L). The guideline is calculated based on the individual chloride concentration in each sample.
(g) = guideline is adopted from the ECCC PNECs (ECCC, 2018) or draft FEQGs (ECCC, 2017).
(h) = guideline is for chromium VI.
(i) = guideline is a level 1 interim screening value.
(j) = dissolved copper guideline was calculated using the simplified Biotic Ligand Midel (BC ENV, 2019). Where values were missing, the temporally nearest value from the same location was taken.
(Mn) = concentration is higher than the 30-day mean BC ENV guideline or outside the recommended pH, DO or total alkalinity range.
(Mx) = concentration is higher than the maximum BC ENV guideline or outside the recommended pH, DO or total alkalinity range.
(E) = concentration is higher than the EVWQP benchmarks guideline.
Bolded concentrations are higher than water quality guidelines.
Shaded concentrations are higher than the EVWQP benchmark (e.g., for nitrate, total selenium, dissolved cadmium or sulphate).
Water quality data and guidelines shown in this table were rounded to reflect laboratory or field instrument precision after comparisons to guidelines. Therefore, values slighlty above guidelines may be displayed as being equal to the guidelines and identified as exceedances. Concentrations equal to the guideline values were not identified as exceedances.
Concentrations were screened against available Working and Approved British Columbia Ministry of Environment and Climate Change Strategy (BC ENV) Water Quality Guidelines for the Protection of Aquatic Life; Accessed January 2020 from: https://www2.gov.bc.ca/gov/content/environment/air-land-water/water/water-quality/water-quality-guidelines.
- = no guideline or no data
bC ENV = British Columbia Ministry of Environment & Climate Change Strategy; EVWQP = Elk Valley Water Quality Plan guidelines; *C. dubia* = *Ceriodaphnia dubia* ; *P. subcapitata* = *Pseudokirchneriella subcapitata* ; *H. azteca* = *Hyalella azteca* ; *P. promelas* = *Pimephales promelas* ; *O. mykiss* = *Oncorhynchus mykiss* ; CV = coefficient of variation; ∑ = sum of; WQGs = Water Quality Guidelines; CaCO3 = calcium carbonate; mg/L = milligrams per litre; µS/cm = microsiemens per centimeter; NTU = nephelometric turbidity units; meq/L = milliequivalents per litre; mg-N/L = milligrams of Nitrogen per litre; mg=P/L = milligrams of Phosphorus per litre.
BC ENV (B.C. Ministry of Climate Chande Strategy). 2019. Copper Water Quality guideline for the Protection of Aquatic Life-Technical Report. Water Quality Guideline Series, WQG-03-1. Prov. B.C., Victoria B.C.

(a) = guideline is a minimum value, unless the background concentration or value is lower.
(b) = guideline is adopted from CCME Canadian Environmental Quality Guidelines (CCME, 1999).
(c) = guideline is hardness dependent. The guideline range shown is based on the hardness range observed in the dataset (217 to 640 mg/L). The guideline is calculated based on the individual hardness value for each sample.
(d) = for some samples, water hardness was greater than 250 mg/L. At this hardness, no BC ENV water quality guideline has been established for sulphate; however, the observed data were screened against the guideline for very hard water (i.e., 429 mg/L) for comparative purposes.
(e) = guideline is chloride dependent. The guideline range shown is based on the chloride concentration range observed in the dataset (2,5500 to 23,1000 mg/L). The guideline is calculated based on the individual chloride concentration in each sample.
(f) = guideline is adopted from the ECCC PNECs (ECCC, 2018) or draft FEQGs (ECCC, 2017).
(g) = guideline is for chromium VI.
(h) = guideline is pH-dependent. The guideline range shown is based on the pH range observed in the dataset (8.0 to 8.4). The guideline is calculated based on the individual pH for each sample.
(i) = guideline is a level 1 interim screening value.
(j) = dissolved copper guideline was calculated using the simplified Biotic Ligand Midel (BC ENV, 2019). Where values were missing, the temporally nearest value from the same location was taken.
(Mn) = concentration is higher than the 30-day mean BC ENV guideline or outside the recommended pH, DO or total alkalinity range.
(Mx) = concentration is higher than the maximum BC ENV guideline or outside the recommended pH, DO or total alkalinity range.
(E) = concentration is higher than the EVWQP benchmarks guideline.
Bolded concentrations are higher than water quality guidelines.
Shaded concentrations are higher than the EVWQP benchmark (e.g., for nitrate, total selenium, dissolved cadmium or sulphate).
DL>MAC = analytical detection limit is higher than the 30-day mean BC ENV guideline.
Water quality data and guidelines shown in this table were rounded to reflect laboratory or field instrument precision after comparisons to guidelines. Therefore, values slightly above guidelines may be displayed as being equal to the guidelines and identified as exceedances. Concentrations equal to the guideline values were not identified as exceedances.
Concentrations were screened against available Working and Approved British Columbia Ministry of Environment and Climate Change Strategy (BC ENV) Water Quality Guidelines for the Protection of Aquatic Life; Accessed January 2020 from: https://www2.gov.bc.ca/gov/content/environment/air-land-water/water/water-quality/water-quality-guidelines.
- = no guideline or no data
BC ENV = British Columbia Ministry of Environment & Climate Change Strategy; EVWQP = Elk Valley Water Quality Plan guidelines; *C. dubia* = *Ceriodaphnia dubia* ; *P. subcapitata* = *Pseudokirchneriella subcapitata* ; *H. azteca* = *Hyalella azteca* ; *P. promelas* = *Pimephales promelas* ; *O. mykiss* = *Oncorhynchus mykiss* ; CV = coefficient of variation; ∑ = sum of; WQGs = Water Quality Guidelines; CaCO3 = calcium carbonate; mg/L = milligrams per litre; µS/cm = microsiemens per centimeter; NTU = nephelometric turbidity units; meq/L = milliequivalents per litre; mg-N/L = milligrams of Nitrogen per litre; mg-P/L = milligrams of Phosphorus per litre.
BC ENV (B.C. Ministry of Climate Chande Strategy). 2019. Copper Water Quality guideline for the Protection of Aquatic Life-Technical Report. Water Quality Guideline Series, WQG-03-1. Prov. B.C., Victoria B.C.

Notes:

"-D-" = dissolved concentration; "-T-" = total concentration; "-N-" = normal concentration; $CaCO_3$ = calcium carbonate; $\sum$TU = sum of toxic units; WQG = water quality guideline; mg/l = milligrams per litre; ug/l = micrograms per litre; % = percent.

Screening

Concentrations of parameters in 2021 tests categorized as possible or likely response are shaded if the concentration is greater than the maximum concentration measured in references or tests categorized as no adverse response.

Notes:
"-D-" = dissolved concentration; "-T-" = total concentration; "-N-" = normal concentration; $CaCO_3$ = calcium carbonate; ∑TU = sum of toxic units; WQG = water quality guideline; mg/l = milligrams per litre; ug/l = micrograms per litre; % = percent.

Screening
Concentrations of parameters in 2021 tests categorized as possible or likely response are shaded if the concentration is greater than the maximum concentration measured in references or tests categorized as no adverse response.

Notes:
"-D-" = dissolved concentration; "-T-" = total concentration; "-N-" = normal concentration; $CaCO_3$ = calcium carbonate; ∑TU = sum of toxic units; WQG = water quality guideline; mg/l = milligrams per litre; ug/l = micrograms per litre; % = percent.

Screening
Concentrations of parameters in 2021 tests categorized as possible or likely response are shaded if the concentration is greater than the maximum concentration measured in references or tests categorized as no adverse response.

Notes:

% = percent; $CaCO_3$ = calcium carbonate; "-D-" = dissolved concentration; mg/l = milligrams per litre; ntu = nephelometric turbidity units; PC = principle component; "-T-" = total concentration; µg/l = micrograms per litre.

n/a = parameter not included in analysis because concentrations were the same in all samples.

PCA scores for each test are provided in Appendix D.

Shaded value = component loading not between -0.8 and 0.8.

Notes:

% = percent; $CaCO_3$ = calcium carbonate; "-D-" = dissolved concentration; mg/l = milligrams per litre; ntu = nephelometric turbidity units; PC = principle component; "-T-" = total concentration; µg/l = micrograms per litre.

n/a = parameter not included in analysis because concentrations were the same in all samples.

PCA scores for each test are provided in Appendix D.

Shaded value = component loading not between -0.8 and 0.8.

Notes:

% = percent; $CaCO_3$ = calcium carbonate; "-D-" = dissolved concentration; mg/l = milligrams per litre; ntu = nephelometric turbidity units; PC = principle component; "-T-" = total concentration; µg/l = micrograms per litre.

Different scores were provided for dry weight and survival due to differing datasets resulting from a lab technician error in Q2 2021, see report section 3.3.1.3

n/a = parameter not included in analysis because concentrations were the same in all samples.

PCA scores for each test are provided in Appendix D.

Shaded value = component loading not between -0.8 and 0.8.

Notes:

(1) Statistical significance is based on one-tailed comparisons. Significant negative correlations for combined dataset ($\alpha < 0.005$; $r_s < -0.131$) and 2021 dataset ($\alpha < 0.005$; $r_s < -0.286$) are bolded. Strong negative correlations ($r_s < -0.6$) are shaded. - = r_s could not be calculated because parameter concentration was the same in all tests or parameter was not applicable to the dataset.

(2) Parameters are screened against WQGs in Appendix C.

(3) Parameters were retained for graphical analysis if they met one of the following conditions: 1) significant negative correlation and concentration was greater than the chronic BC WQG, or 1) significant negative correlation and there is no chronic BC WQG.

(4) Out of 80 tests in 2021, bromide was only detected once and was not detected in any test with possible or likely adverse effects.

% = percent; $CaCO_3$ = calcium carbonate; "-D-" = dissolved concentration; mg/l = milligrams per litre; "-T-" = total concentration; µg/l = micrograms per litre; WQG = water quality guideline; EVWQP: Elk Valley Water Quality Plan; MIT: Multi-Ion Toxicity.

Notes:

(1) Statistical significance is based on one-tailed comparisons. Significant negative correlations for combined dataset ($\alpha < 0.005$; $r_s < -0.202$) and 2021 dataset ($\alpha < 0.005$; $r_s < -0.413$) are bolded. Strong negative correlations ($r_s < -0.6$) are shaded. - = r_s could not be calculated because parameter concentration was the same in all tests or parameter was not applicable to the dataset.

(2) Parameters are screened against WQGs in Appendix C.

(3) Parameters were retained for graphical analysis if they met one of the following conditions: 1) significant negative correlation and concentration was greater than the chronic BC WQG, or 1) significant negative correlation and there is no chronic BC WQG.

(4) Out of 38 tests in 2021, bromide was only detected in five samples and was not detected in any test with possible or likely adverse effects.

% = percent; $CaCO_3$ = calcium carbonate; "-D-" = dissolved concentration; mg/l = milligrams per litre; "-T-" = total concentration; µg/l = micrograms per litre; WQG = water quality guideline; EVWQP: Elk Valley Water Quality Plan; MIT: Multi-Ion Toxicity.

Table F-5: Spearman Rank Order Correlation for *P. promelas* Survival

Parameter	Survival R_s[1]		Is parameter greater than the chronic WQG or lowest L1 benchmark from EVWQP in at least one test categorized as possible or likely?[2]	Retain Parameter for Graphical Analysis?[3]

Notes:
(1) Statistical significance is based on one-tailed comparisons. Significant negative correlations for combined dataset ($\alpha < 0.005$; $\xi < -0.21$) and 2021 dataset ($\alpha < 0.005$; $\xi < -0.413$) are bolded. Strong negative correlations ($r_s < -0.6$) are shaded. - = r_s could not be calculated because parameter concentration was the same in all tests or parameter was not applicable to the dataset.

(2) Parameters are screened against WQGs in Appendix C.
(3) Parameters were retained for graphical analysis if they met one of the following conditions: 1) significant negative correlation and concentration was greater than the chronic BC WQG, or 1) significant negative correlation and there is no chronic BC WQG.
(4) Out of 80 tests, bromide was only detected once and was not detected in any test with possible or likely adverse effects.
% = percent; $CaCO_3$ = calcium carbonate; "-D-" = dissolved concentration; mg/l = milligrams per litre; "-T-" = total concentration; µg/l = micrograms per litre; WQG = water quality guideline; EVWQP: Elk Valley Water Quality Plan; MIT: Multi-Ion Toxicity.

APPENDIX G

Temporal Plots

Comparison of 2021 Results to Previous Years

Mean results for 2015 through 2021 inclusive were plotted to evaluate potential temporal patterns in responses. As outlined in Section 2.3.5, mean results were control normalized prior to plotting to standardize responses across years. An example plot is provided in Figure 2.3-3. Per the recommendation in the 2020 regional report (Golder 2021c), the normal ranges developed in 2021 (see Section 2.3.3) were used to re-assign historical test results from the regional program (2015 to 2020) into narrative categories of no, possible, or likely adverse response.

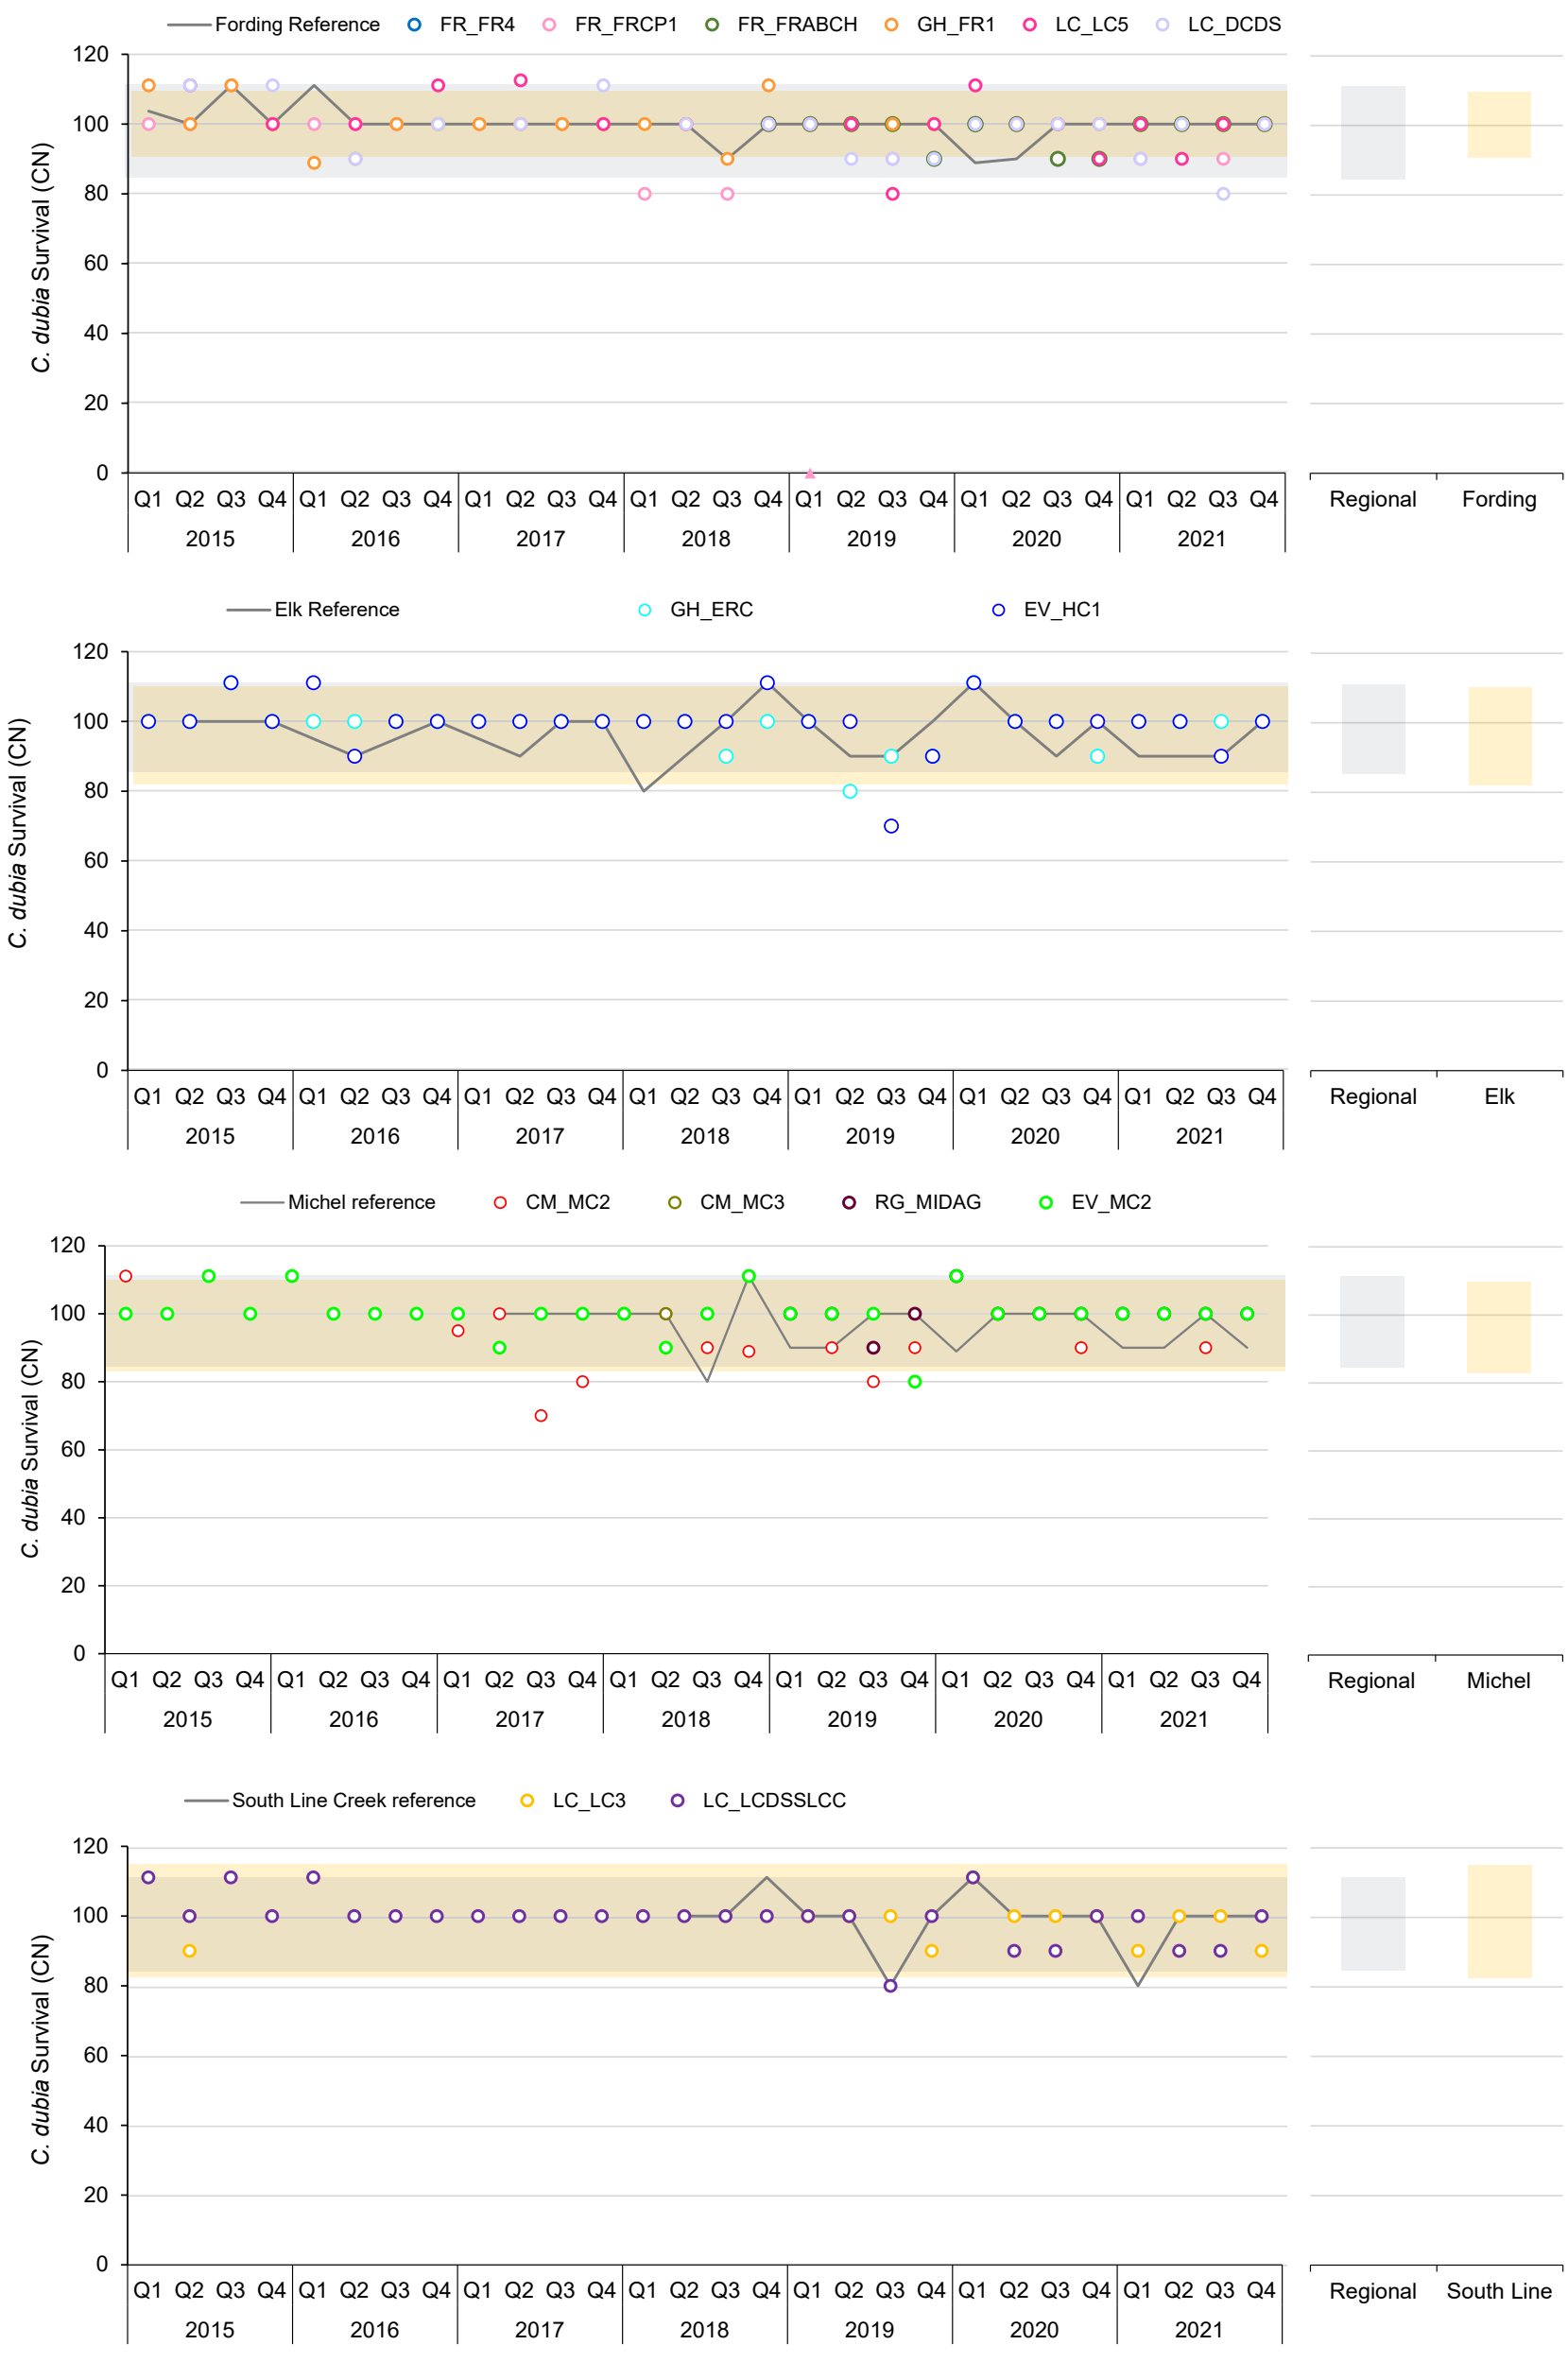
Briefly, figures are interpreted as follows:

- Symbol colour corresponds to an individual test site or reference location.
- Symbol type corresponds to the response category (circle [○] = no adverse response; diamond [◇] = possible adverse response; triangle [△] = likely adverse response).
- Open symbols [○] indicate test sites with a mean response statistically equivalent to all references tested in that batch. Filled symbols [●] indicate test sites with a mean response significantly lower than one or more references tested in that batch.
- Local and regional NRs are provided on the plot to illustrate the range of responses in reference waters.

Mean results are plotted in the following figures:

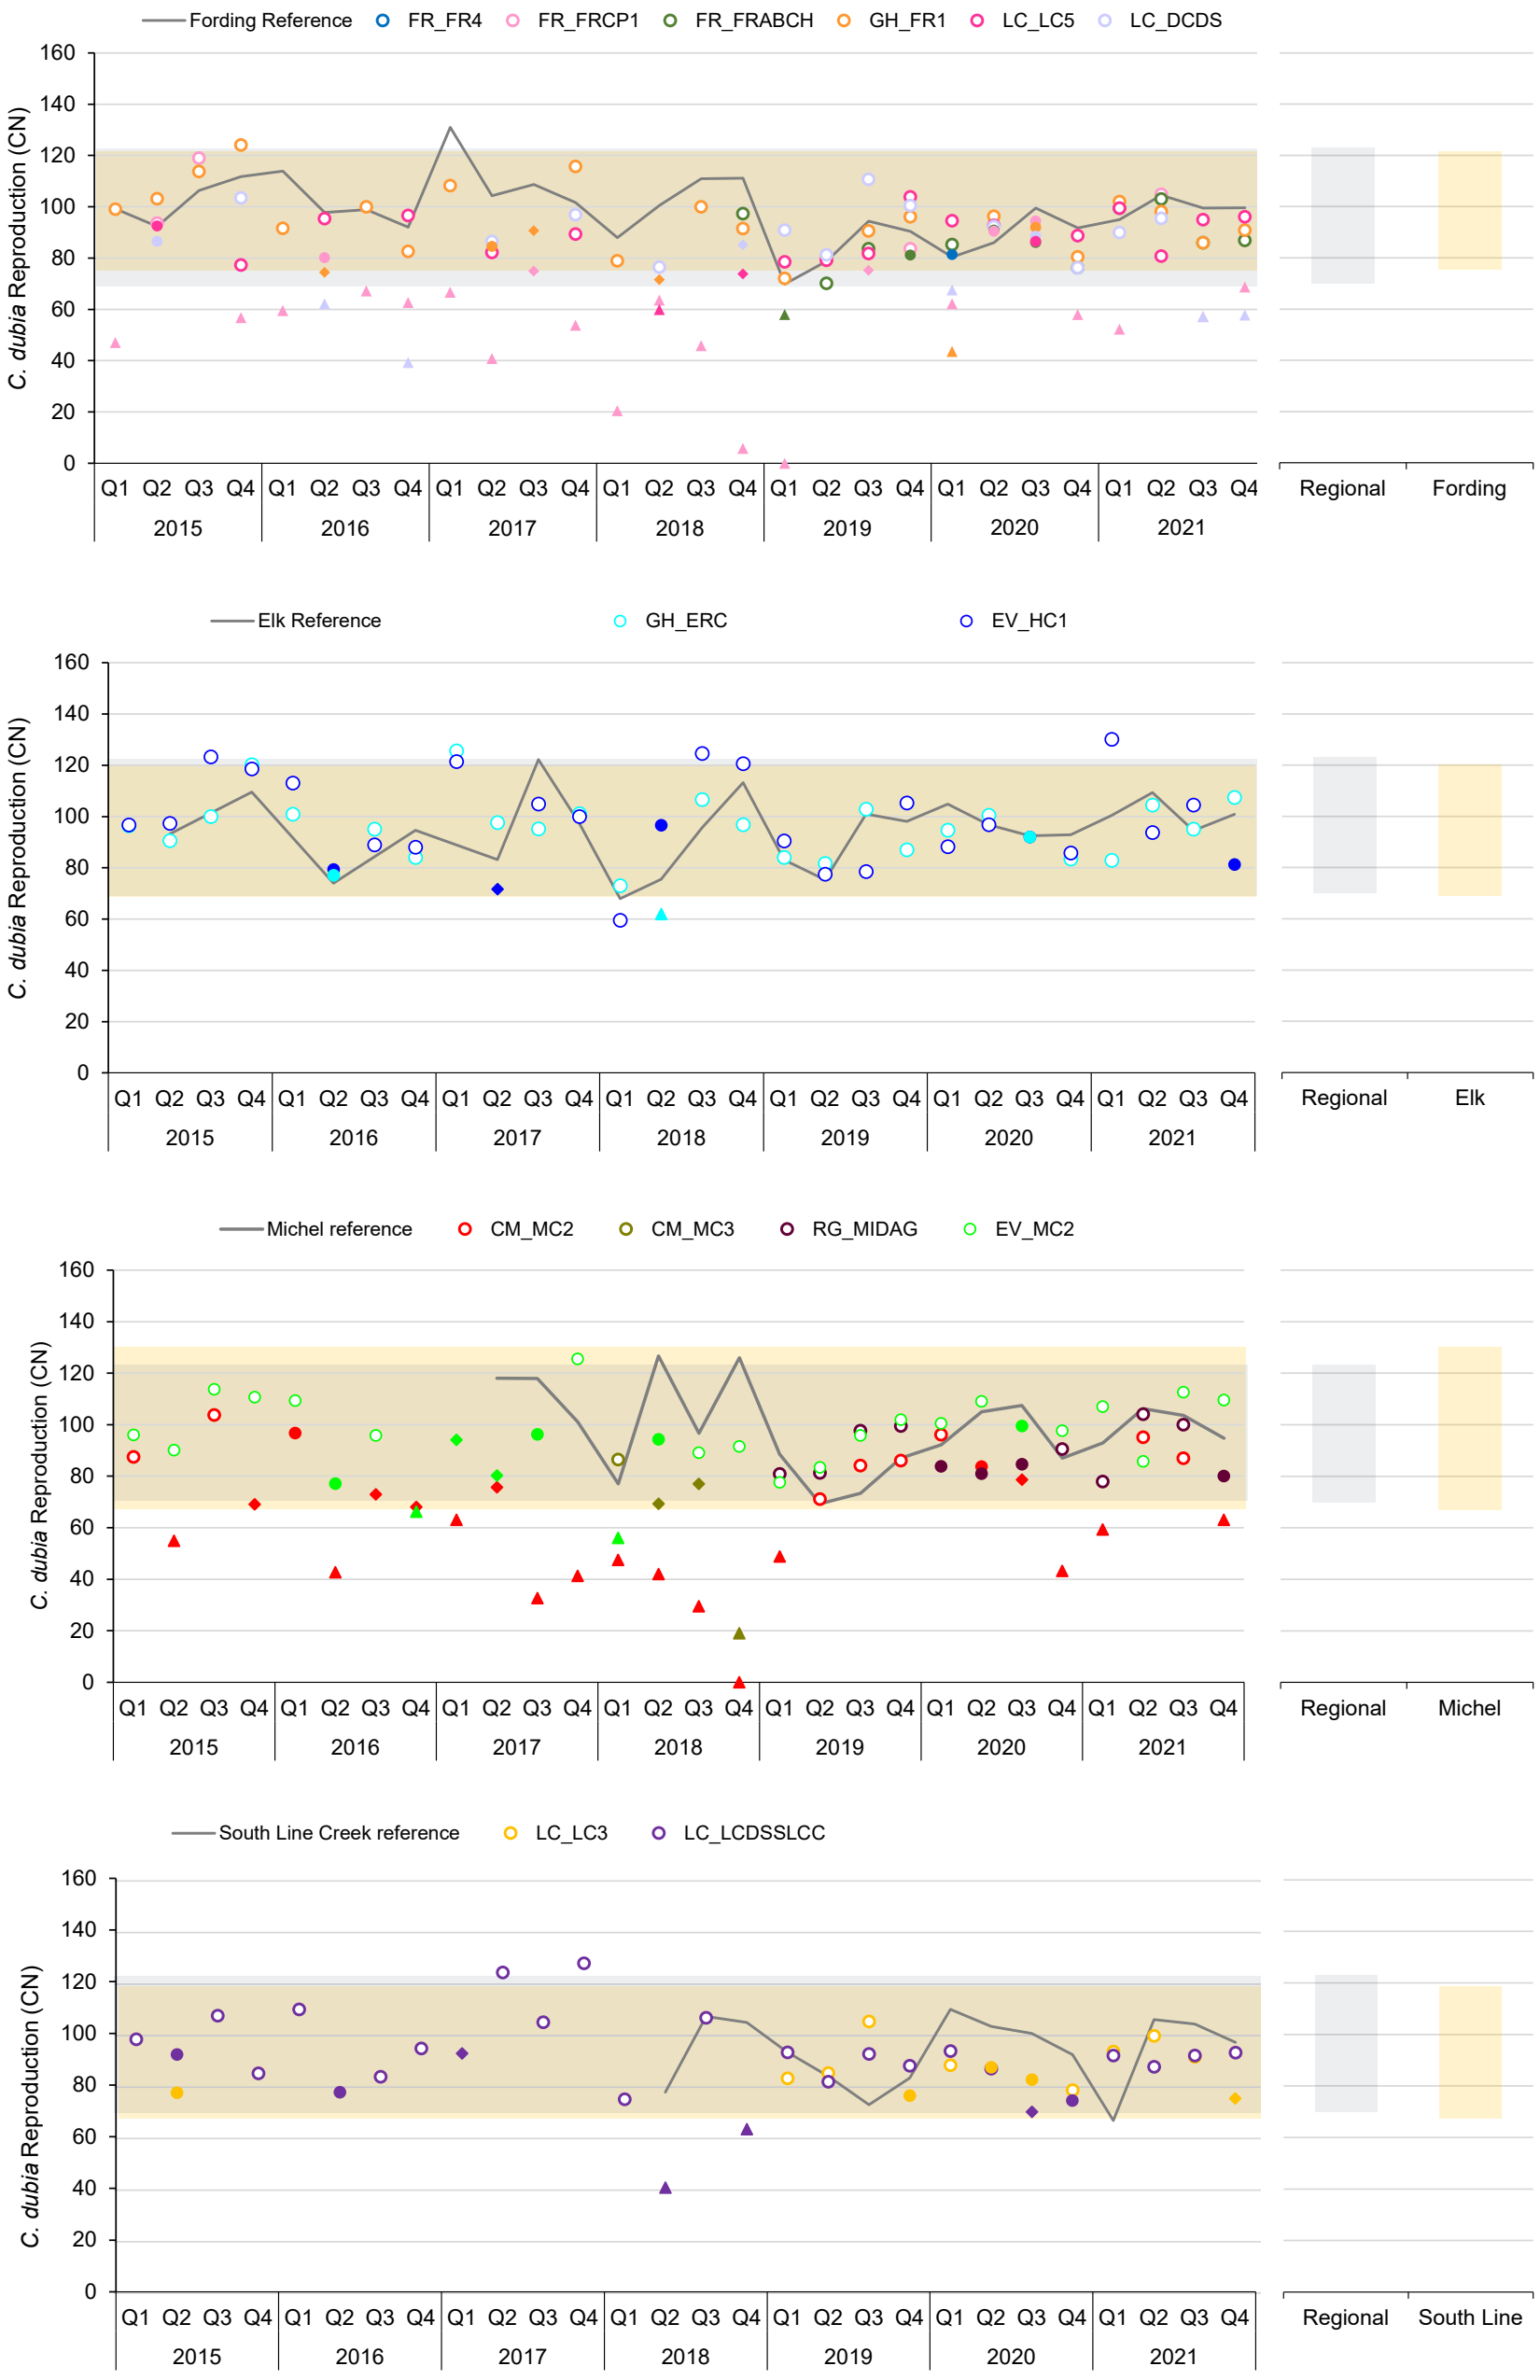
- *C. dubia* survival (Figures G-1) and reproduction (Figure G-2)
- *P. subcapitata* cell yield (Figure G-3)
- *H. azteca* survival (Figure G-4) and dry weight (Figure G-5)
- *O. mykiss* survival (Figure G-6), viability (Figure G-7), length (Figure G-8), and weight (Figure G-9)
- *P. promelas* hatch (Figure G-10), survival (Figure G-11), biomass (Figure G-12), length (Figure G-13), and development (Figure G-14)

Figure G-1: Mean results for *C. dubia* survival in the Fording River reference and its paired test site waters (top left panel), the Elk River reference and its paired test site waters (second left panel), the Michel Creek reference and its paired test site waters (third left panel), and the South Line Creek reference and its paired test site waters (bottom left panel). Regional and local normal ranges (2.5th to 97.5th percentile) are shown as bars (right panels).



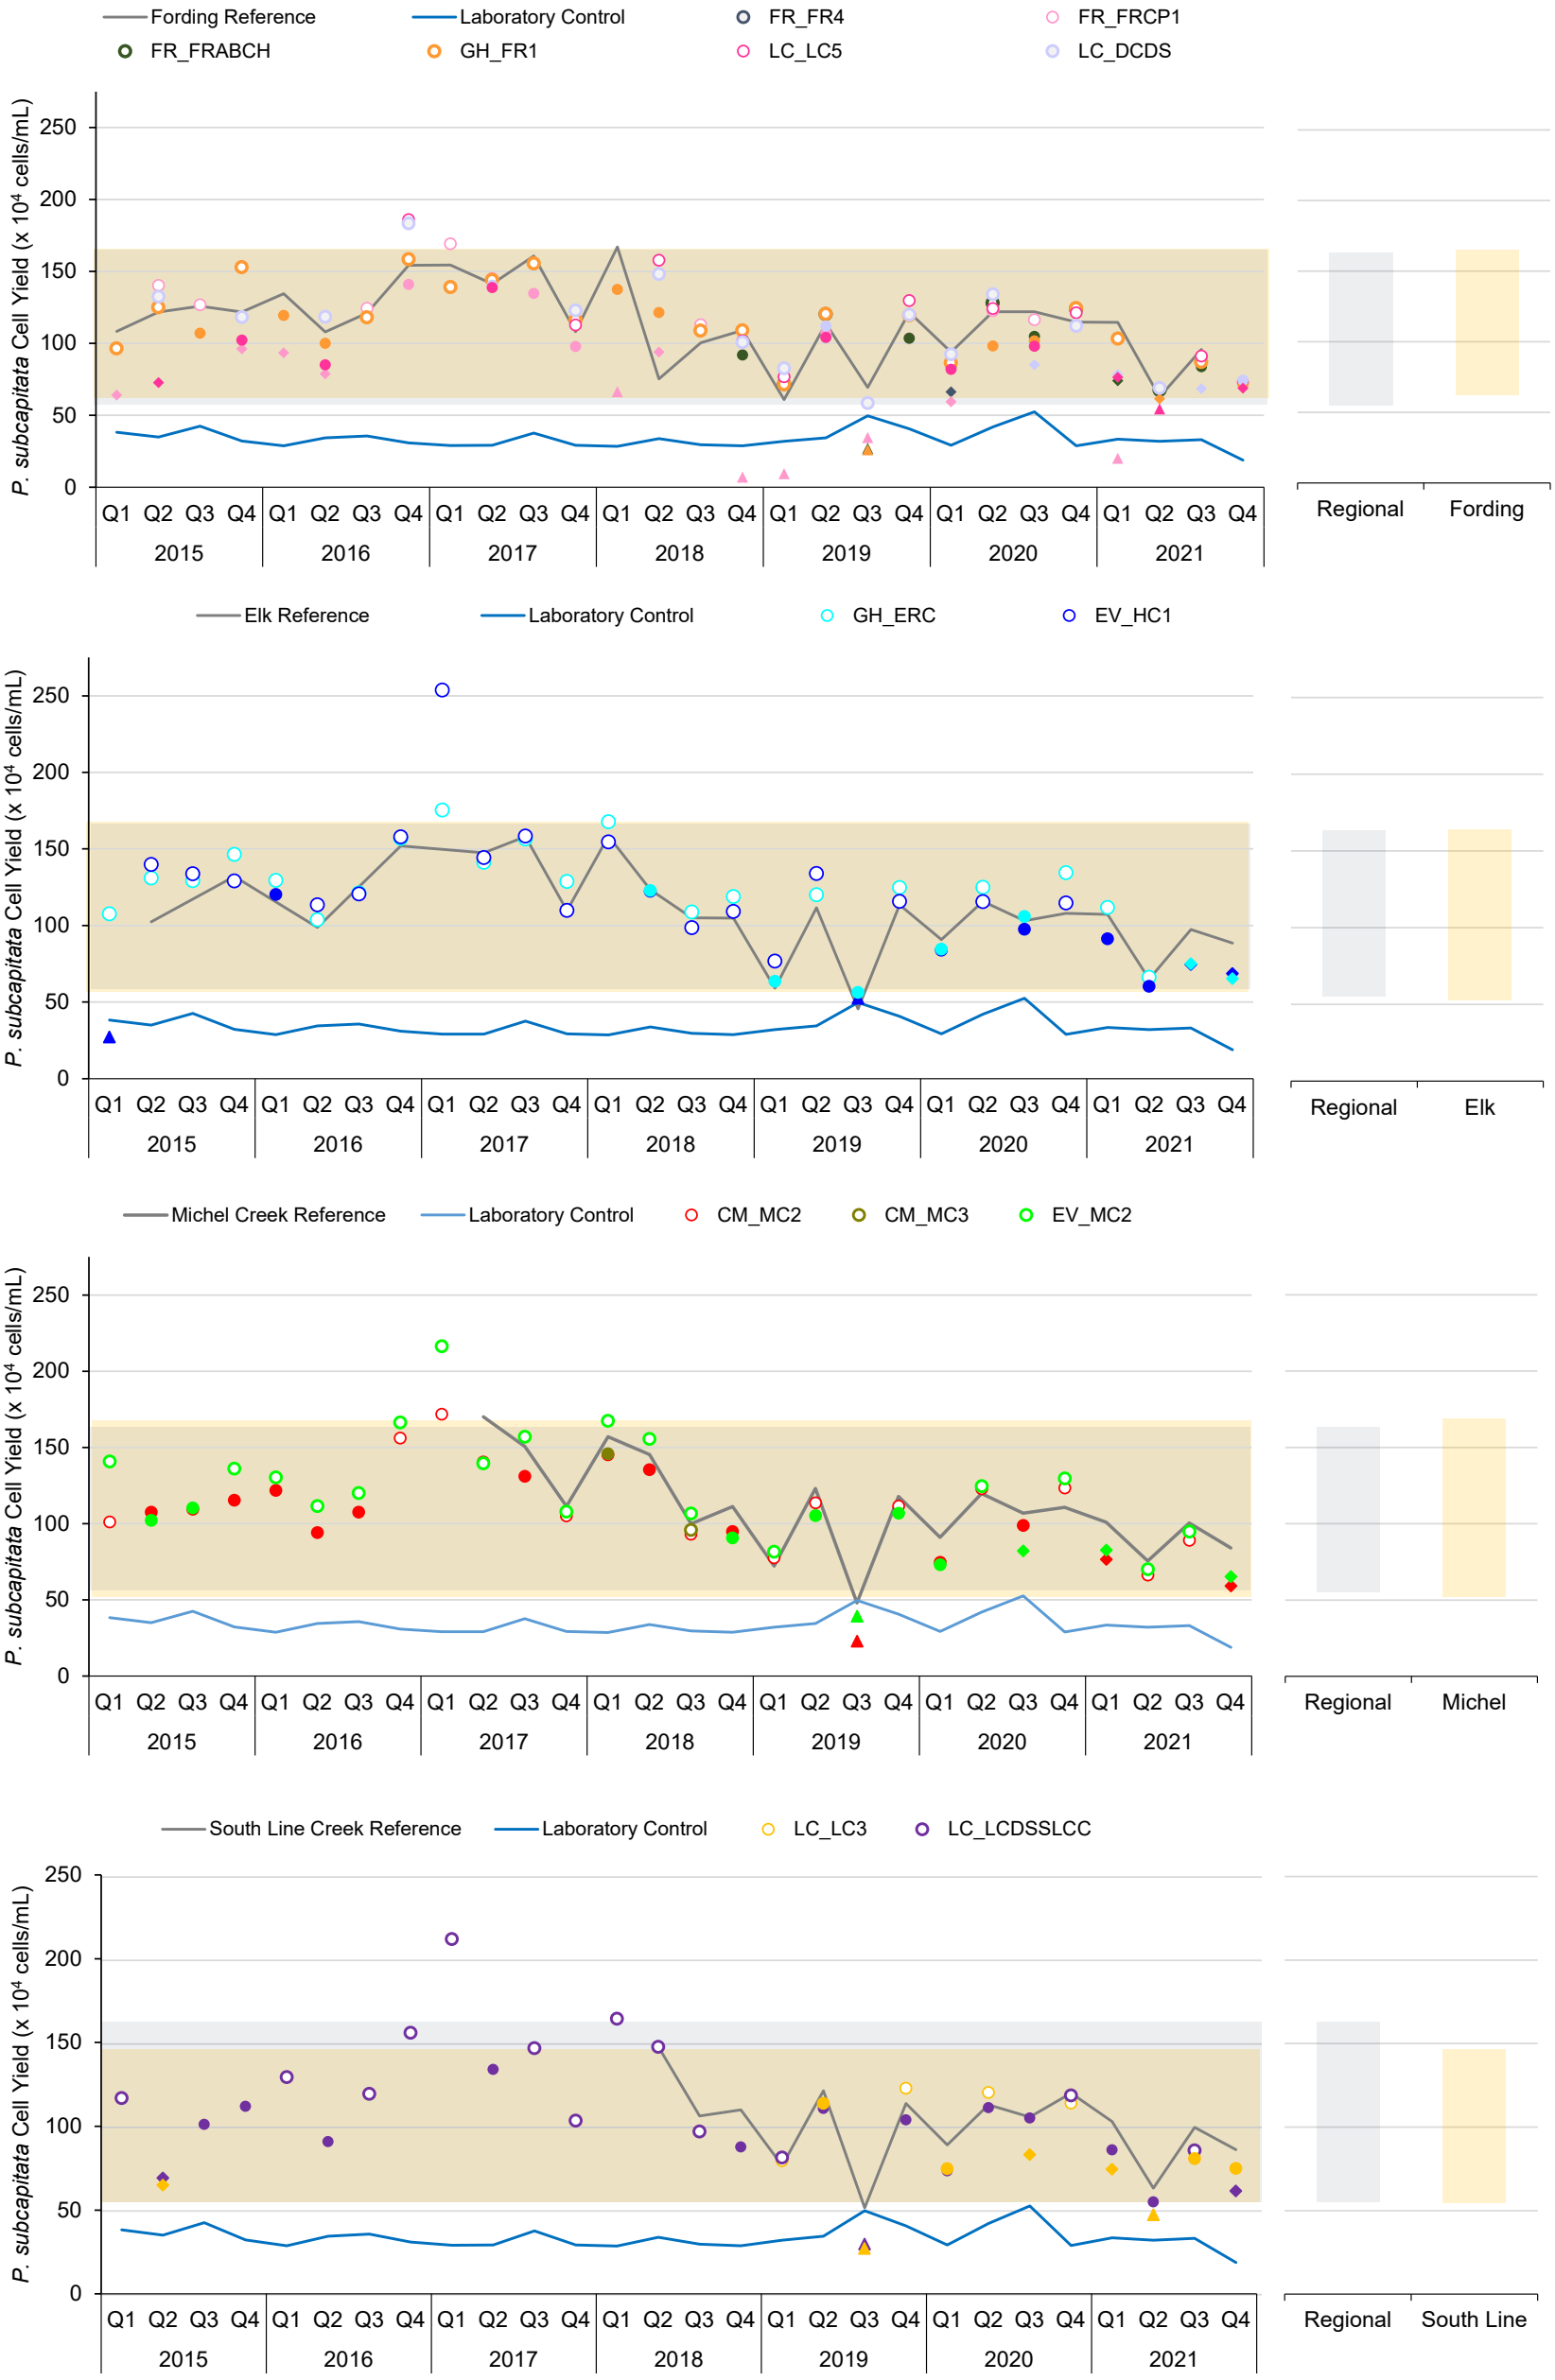
Note: See Figure 2.3-3 for description of lines and symbols. Test sites were compared to their paired local NR (Section 2.3.3).

Figure G-2: Mean results for *C. dubia* reproduction in the Fording River reference and its paired test site waters (top left panel), in the Elk River reference and its paired test site waters (middle left panel), the Michel Creek reference and its paired test site waters (third left panel), and the South Line Creek reference and its paired test site waters (bottom left panel). Regional and local normal ranges (2.5th to 97.5th percentile) are shown as bars (right panels).



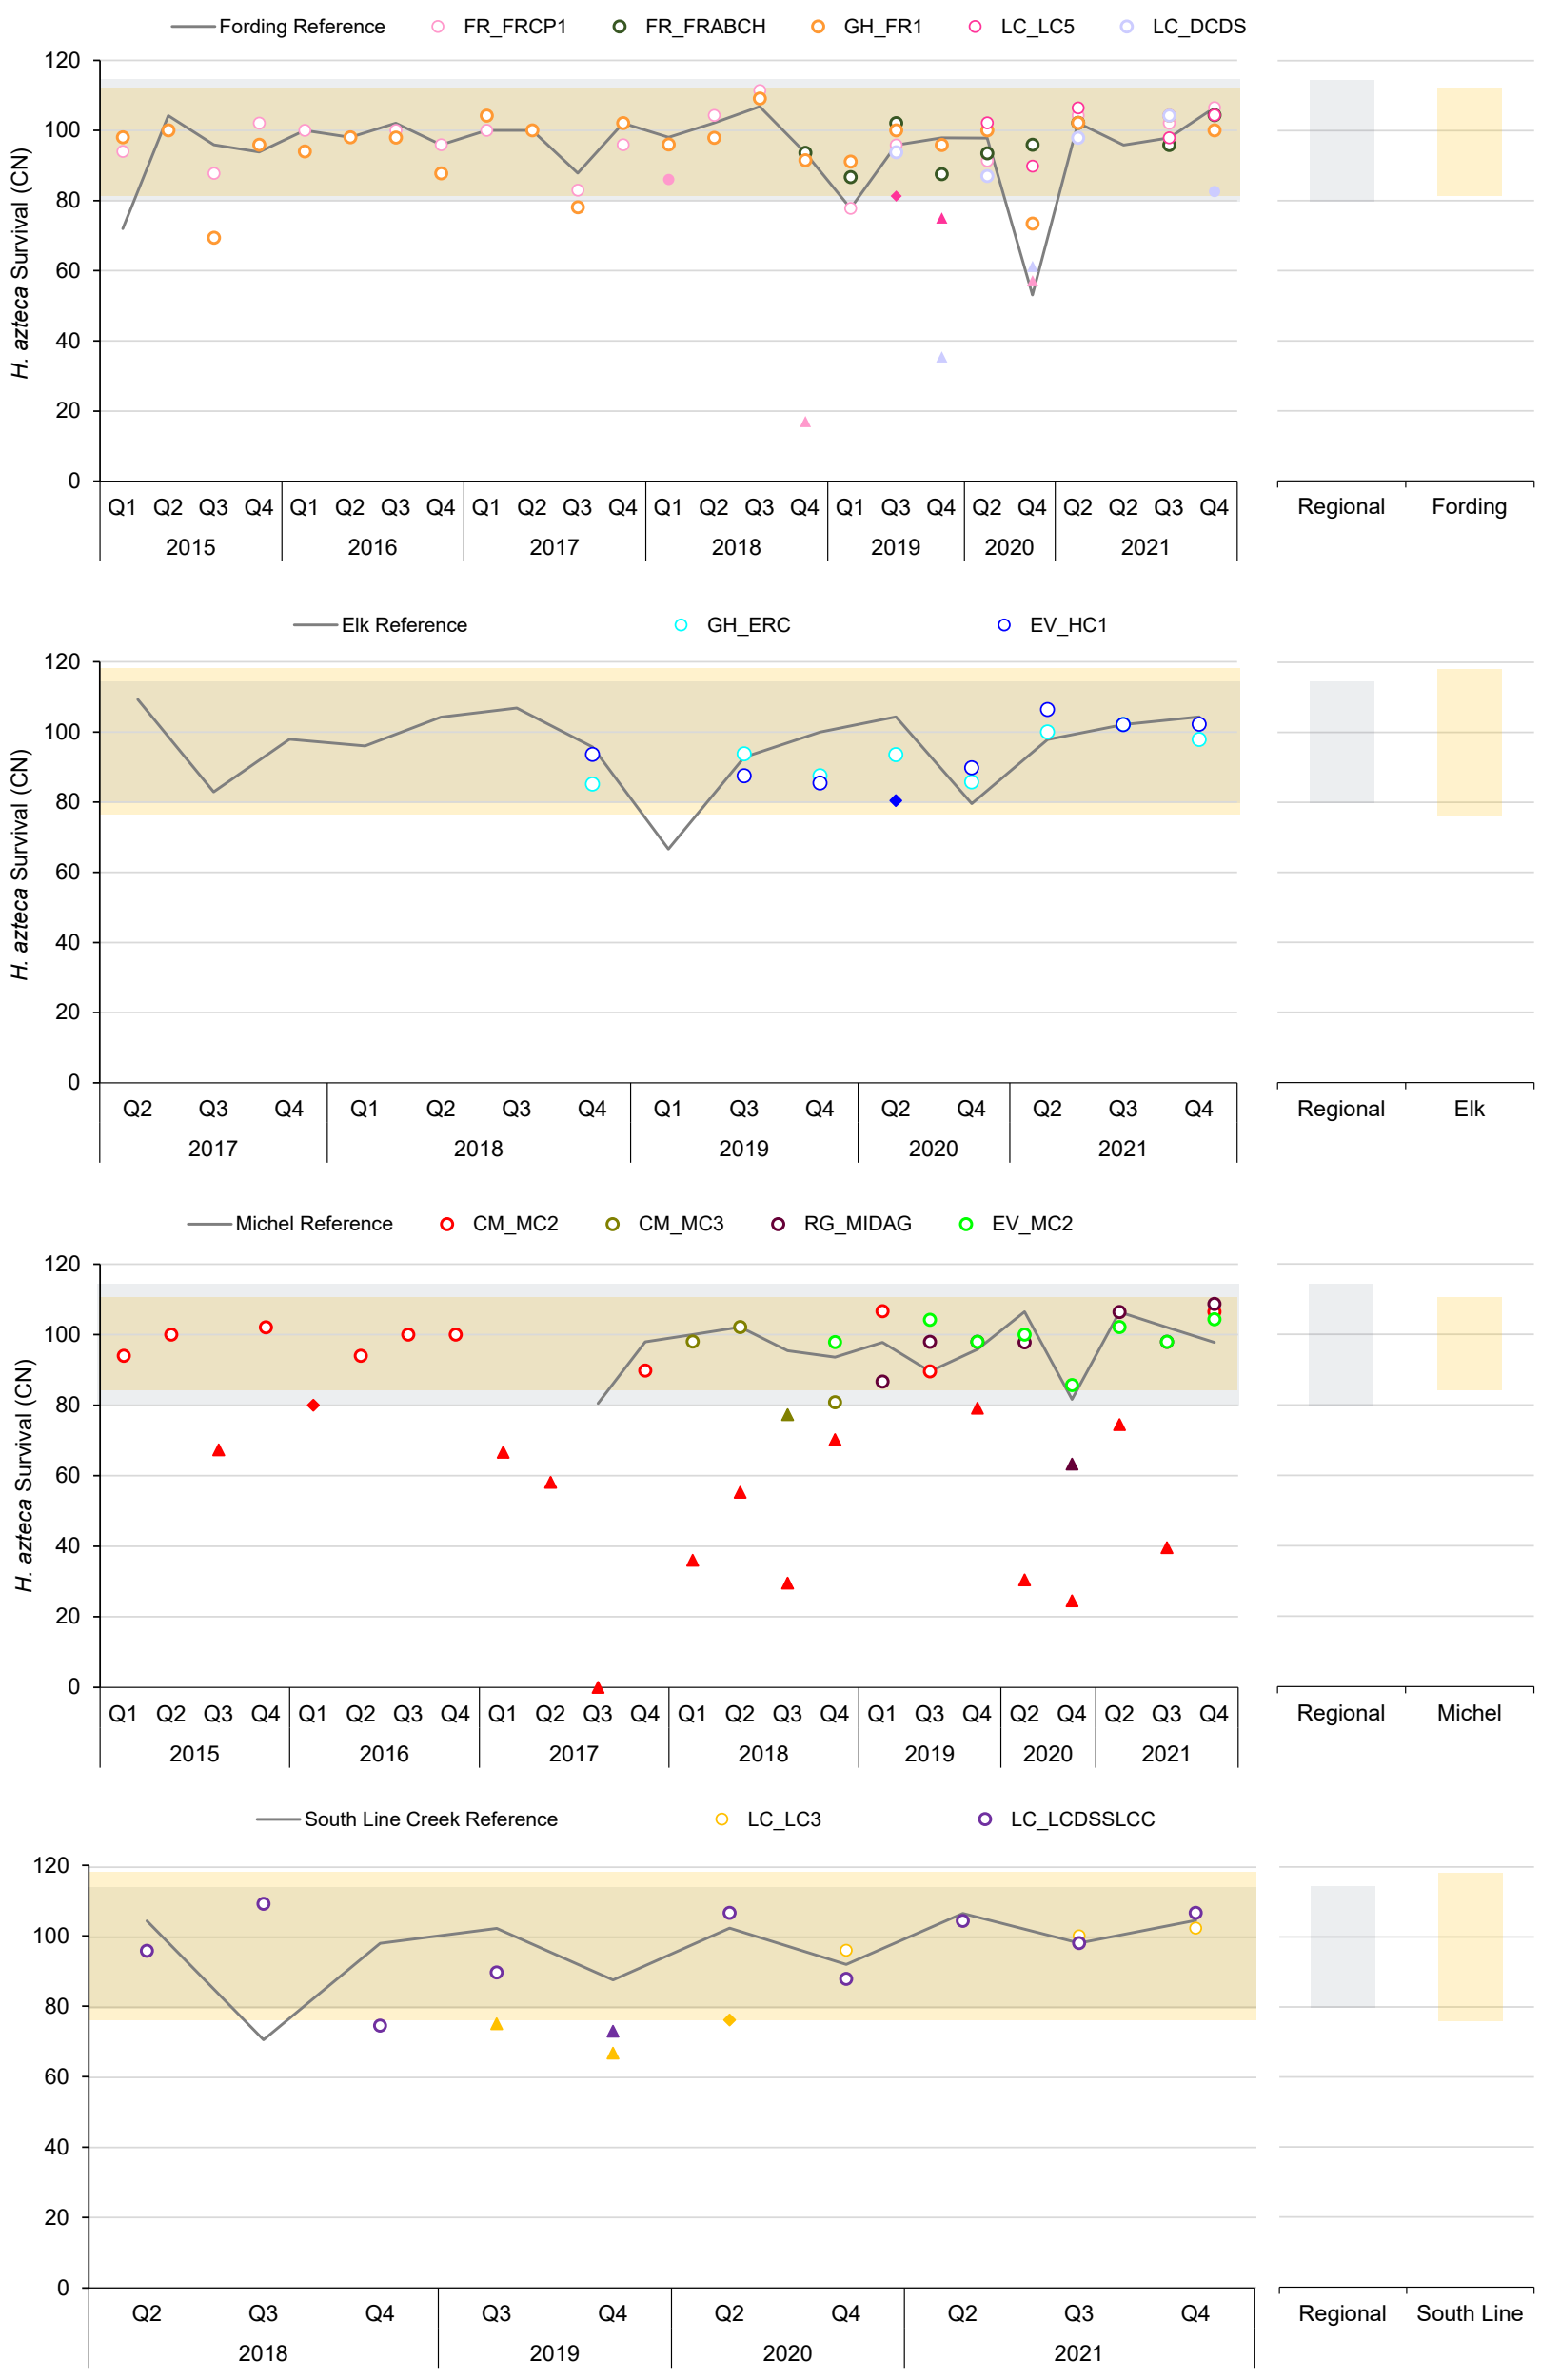
Note: See Figure 2.3-3 for description of lines and symbols. Test sites were compared to their paired local NR (Section 2.3.3).

Figure G-3: Mean results for *P. subcapitata* cell yield in the Fording River reference and its paired test site waters (top left panel), the Elk River reference and its paired test site waters (second left panel), the Michel Creek reference and its paired test site waters (third left panel), and the South Line Creek reference and its paired test site waters (bottom left panel). Regional and local normal ranges (2.5th to 97.5th percentile) are shown as bars (right panels).



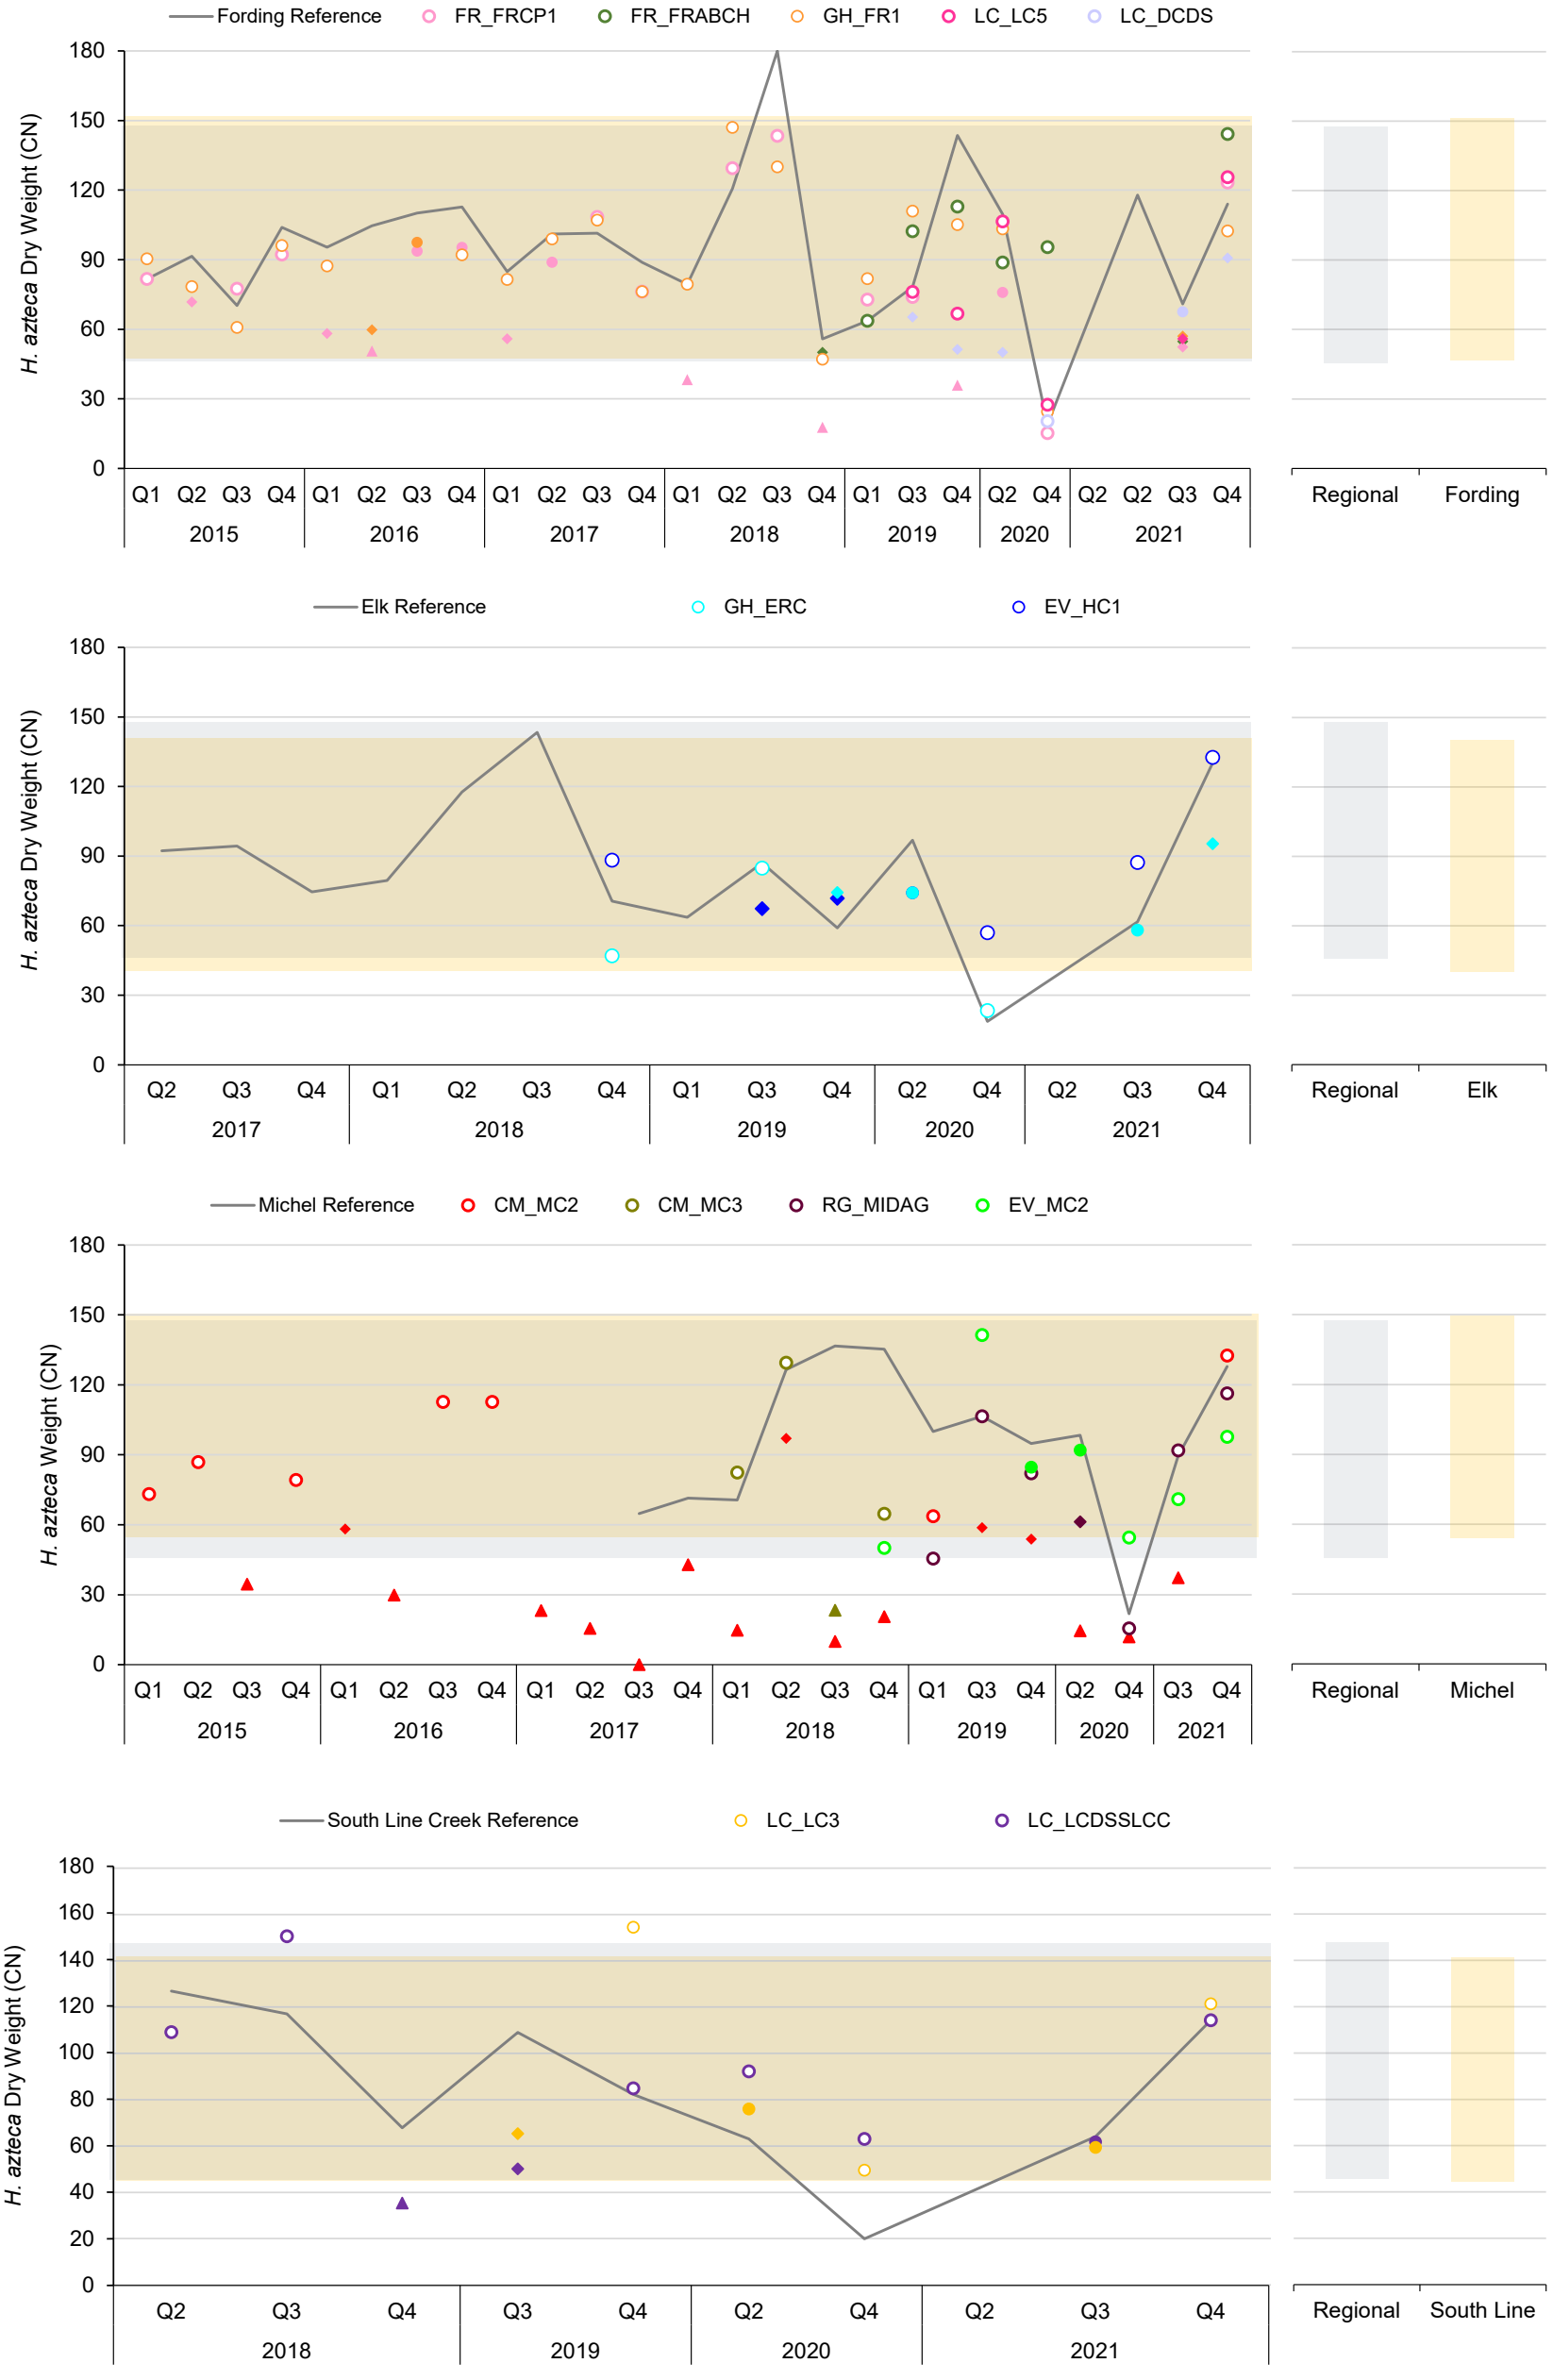
Note: See Figure 2.3-3 for description of lines and symbols. Test sites were compared to their paired local NR (Section 2.3.3).

Figure G-4: Mean results for *H. azteca* survival in the Fording River reference and its paired test site waters (top left panel), the Elk River reference and its paired test site waters (second left panel), the Michel Creek reference and its paired test site waters (third left panel), and the South Line Creek reference and its paired test site waters (bottom left panel). Regional and local normal ranges (2.5th to 97.5th percentile) are shown as bars (right panels).



Note: See Figure 2.3-3 for description of lines and symbols. Test sites were compared to their paired local NR (Section 2.3.3). Due to a lab technician error, Q2 *H. azteca* tests were disposed prior to the measurement of dry weight (see Section 3.1). Tests were repeated in Q2 for the Fording River reference, and then repeated for all stations in Q3 resulting in the Fording reference being re-tested in both Q2 and Q3. Results in the second Q2 of this figure are from the Q2 re-test.

Figure G-5: Mean results for *H. azteca* dry weight in the Fording River reference and its paired test site waters (top left panel), the Elk River reference and its paired test site waters (second left panel), the Michel Creek reference and its paired test site waters (third left panel), and the South Line Creek reference and its paired test site waters (bottom left panel). Regional and local normal ranges (2.5th to 97.5th percentile) are shown as bars (right panels).

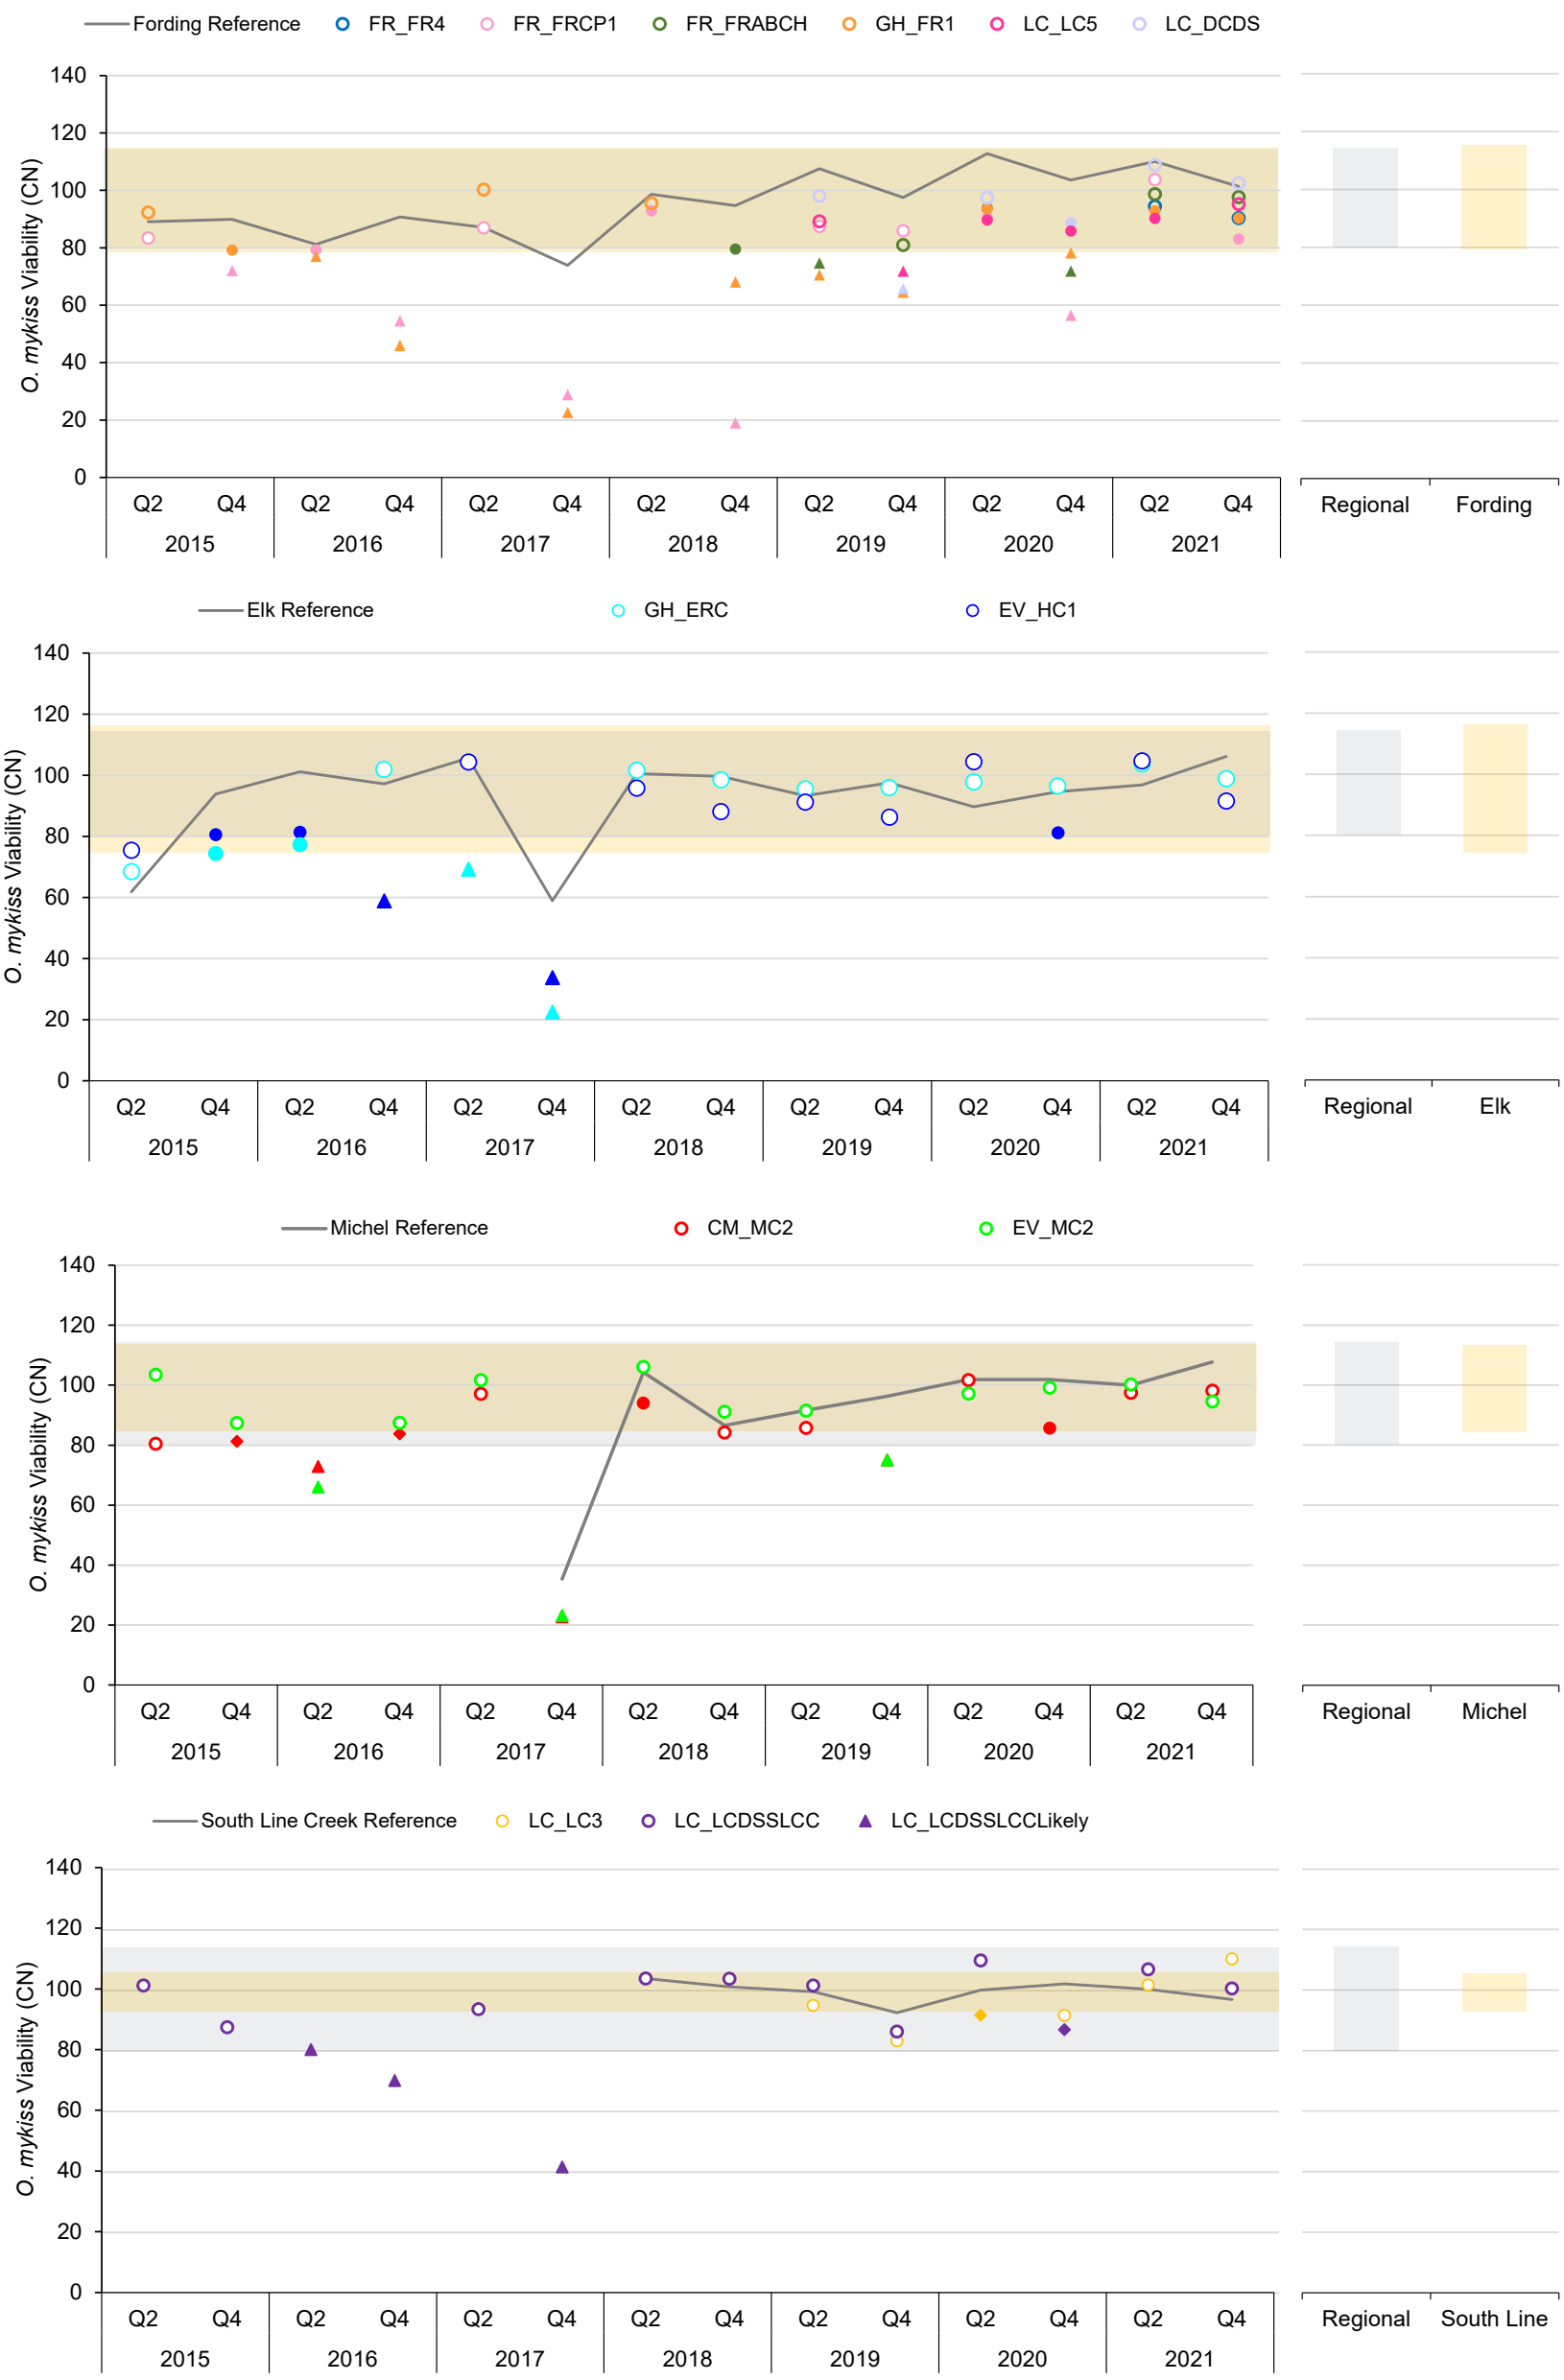


Note: See Figure 2.3-3 for description of lines and symbols. Test sites were compared to their paired local NR (Section 2.3.3). Due to a lab technician error, Q2 *H. azteca* tests were disposed prior to the measurement of dry weight (see Section 3.1). Tests were repeated in Q2 for the Fording River reference, therefore dry weight results in Q2 of this figure are from the Q2 re-test. All stations were re-tested in Q3.

Figure G-6: Mean results for *O. mykiss* survival in the Fording River reference and its paired test site waters (top left panel) and the Elk River reference and its paired test site waters (second left panel), the Michel Creek reference and its paired test site waters (third left panel), and the South Line Creek reference and its paired test site waters (bottom left panel). Regional and local normal ranges (2.5th to 97.5th percentile) are shown as bars (right panels).

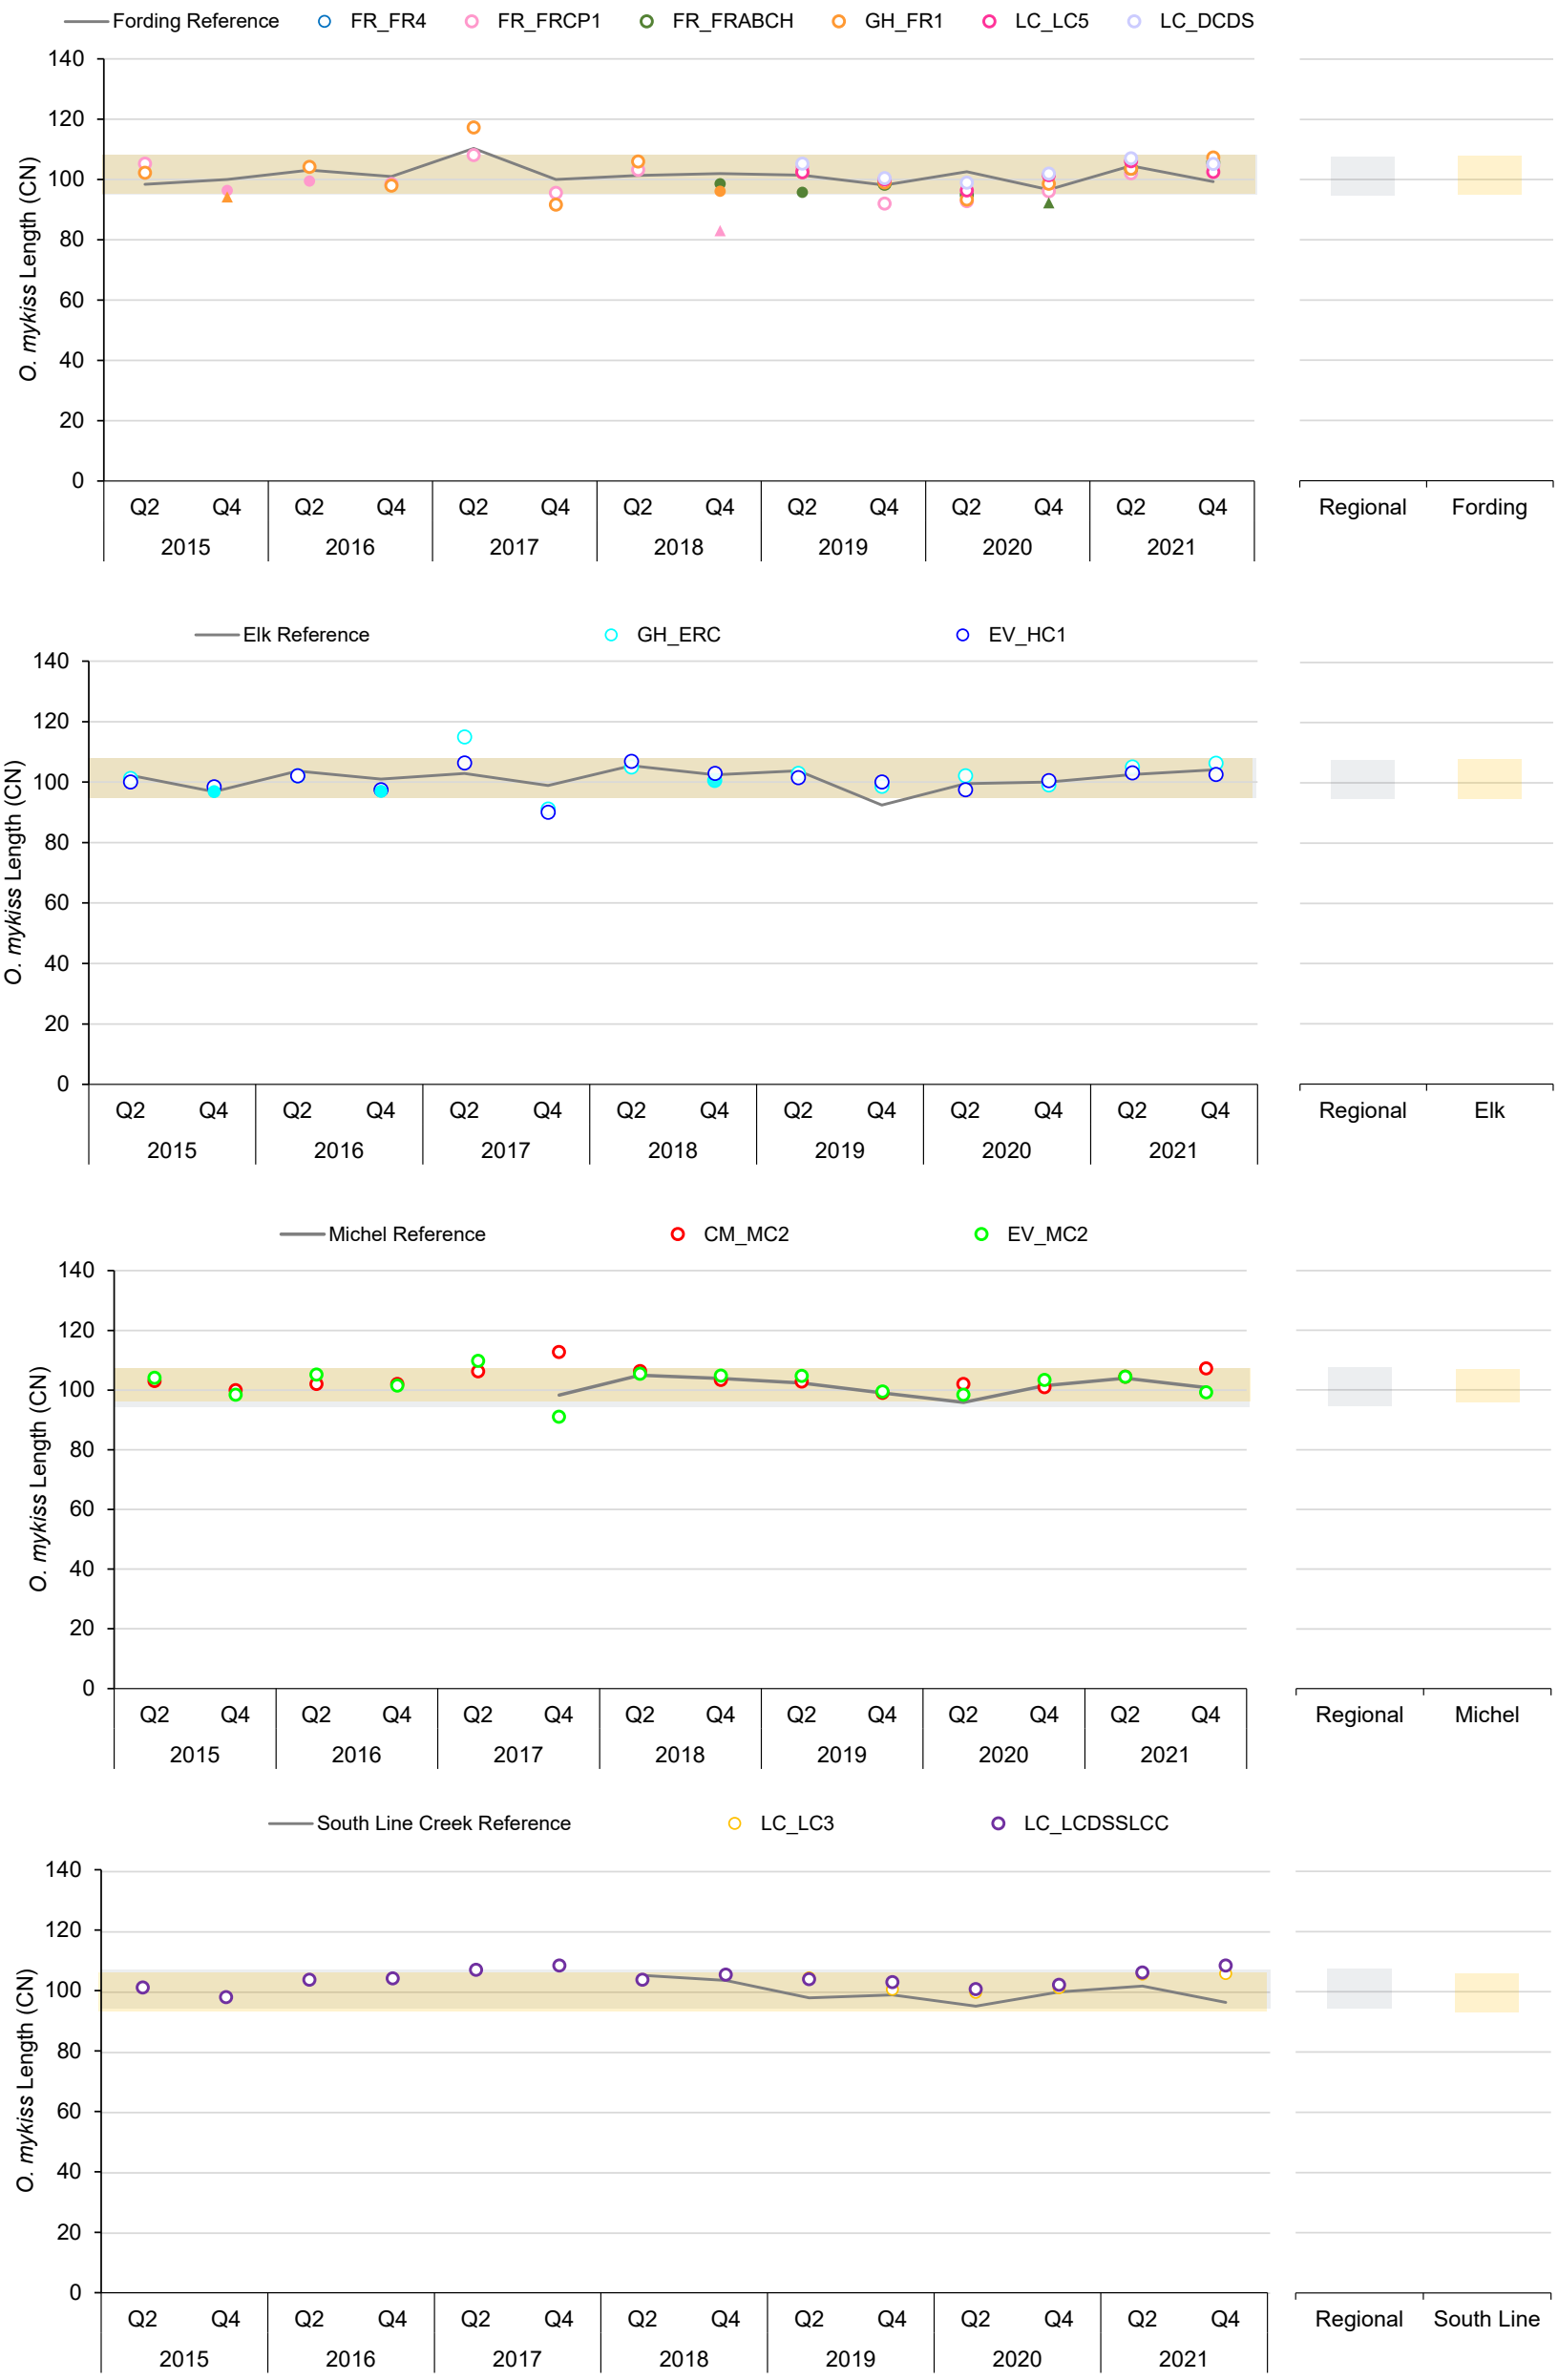
Note: See Figure 2.3-3 for description of lines and symbols. Test sites were compared to their paired local NR (Section 2.3.3). Evidence of microbes were observed in Q2 FR_UFR1, GH_ER2, CM_MC1, LC_SLC, FR_FRABCH, GH_FR1, LC_LC5, LC_DCDS, GH_ER2, CM_MC2, EV_MC2, and LC_LC3, and Q4 FR_FRCP1, FR_FRABCH, GH_FR1, LC_DCDS, GH_ERC, and CM_MC2 *O. mykiss* tests (Section 3.1).

Figure G-7: Mean results for *O. mykiss* viability in the Fording River reference and its paired test site waters (top left panel) and the Elk River reference and its paired test site waters (second left panel), the Michel Creek reference and its paired test site waters (third left panel), and the South Line Creek reference and its paired test site waters (bottom left panel). Regional and local normal ranges (2.5th to 97.5th percentile) are shown as bars (right panels).



Note: See Figure 2.3-3 for description of lines and symbols. Test sites were compared to their paired local NR (Section 2.3.3). Evidence of microbes were observed in Q2 FR_UFR1, GH_ER2, CM_MC1, LC_SLC, FR_FRABCH, GH_FR1, LC_LC5, LC_DCDS, GH_ER2, CM_MC2, EV_MC2, and LC_LC3, and Q4 FR_FRCP1, FR_FRABCH, GH_FR1, LC_DCDS, GH_ERC, and CM_MC2 *O. mykiss* tests (Section 3.1).

Figure G-8: Mean results for *O. mykiss* length in the Fording River reference and its paired test site waters (top left panel) and the Elk River reference and its paired test site waters (second left panel), the Michel Creek reference and its paired test site waters (third left panel), and the South Line Creek reference and its paired test site waters (bottom left panel). Regional and local normal ranges (2.5th to 97.5th percentile) are shown as bars (right panels).

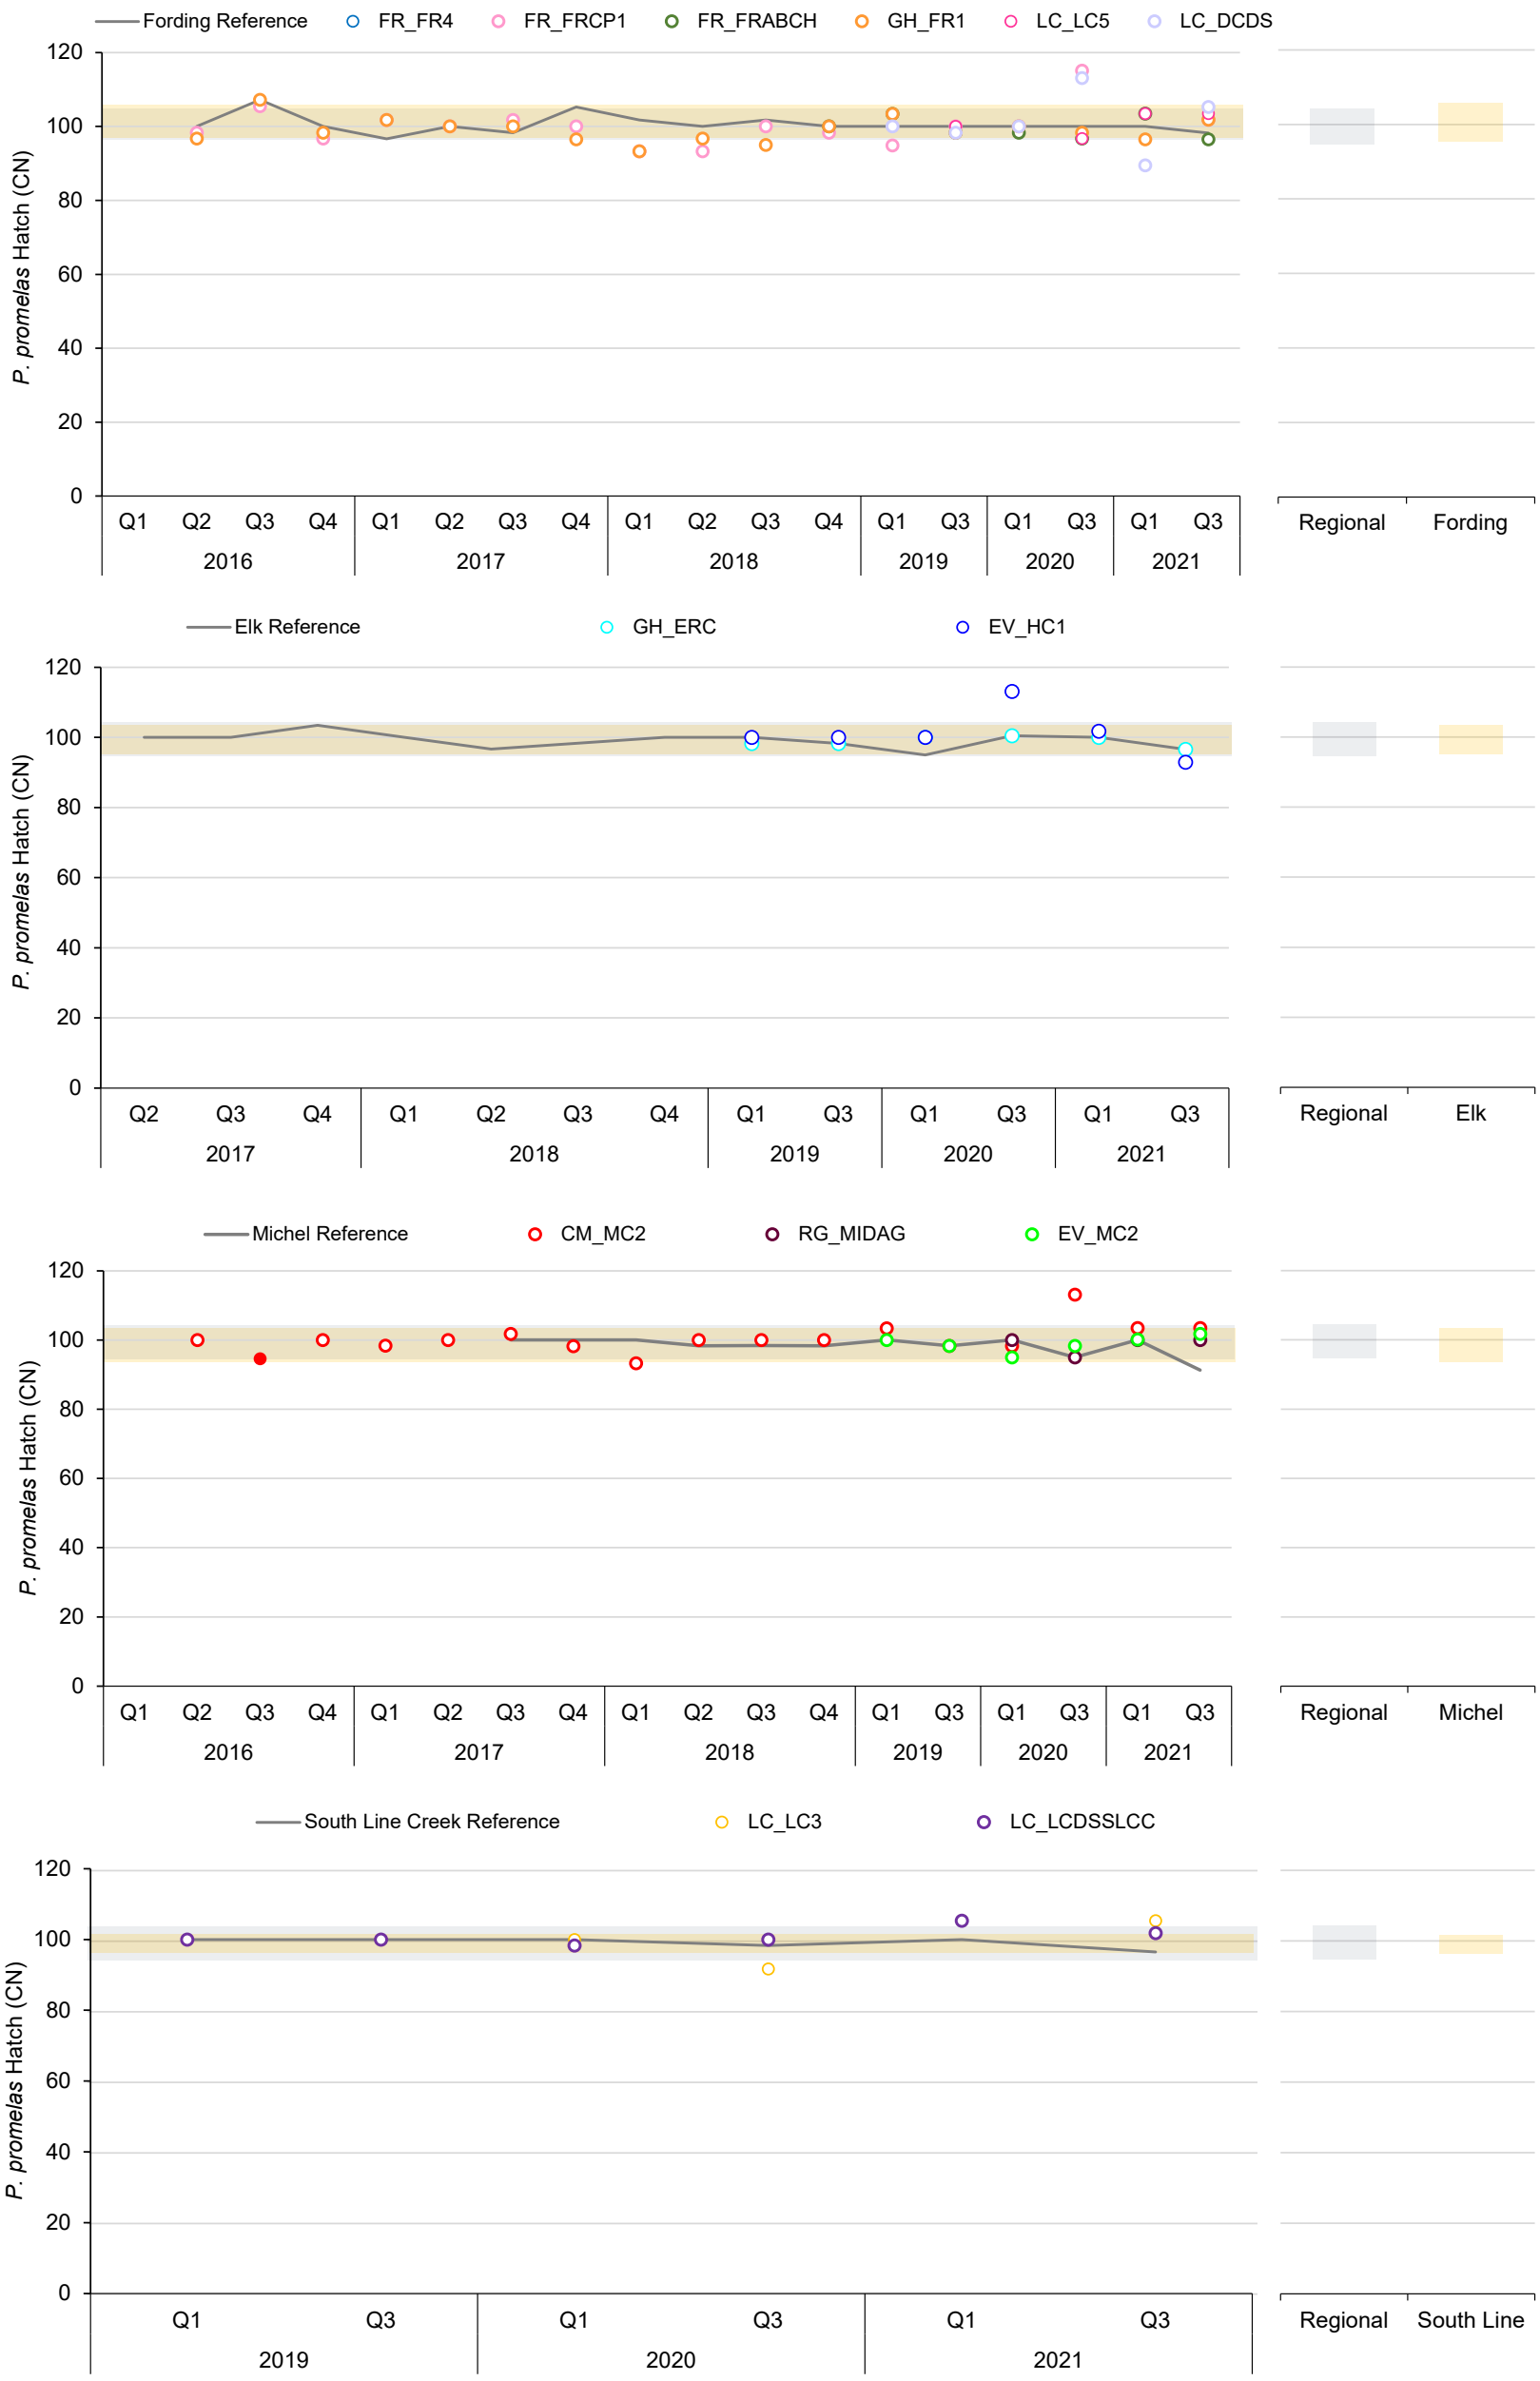


Note: See Figure 2.3-3 for description of lines and symbols. Test sites were compared to their paired local NR (Section 2.3.3). Evidence of microbes were observed in Q2 FR_UFR1, GH_ER2, CM_MC1, LC_SLC, FR_FRABCH, GH_FR1, LC_LC5, LC_DCDS, GH_ER2, CM_MC2, EV_MC2, and LC_LC3, and Q4 FR_FRCP1, FR_FRABCH, GH_FR1, LC_DCDS, GH_ERC, and CM_MC2 *O. mykiss* tests (Section 3.1).

Figure G-9: Mean results for *O. mykiss* weight in the Fording River reference and its paired test site waters (top left panel) and the Elk River reference and its paired test site waters (second left panel), the Michel Creek reference and its paired test site waters (third left panel), and the South Line Creek reference and its paired test site waters (bottom left panel). Regional and local normal ranges (2.5th to 97.5th percentile) are shown as bars (right panels).

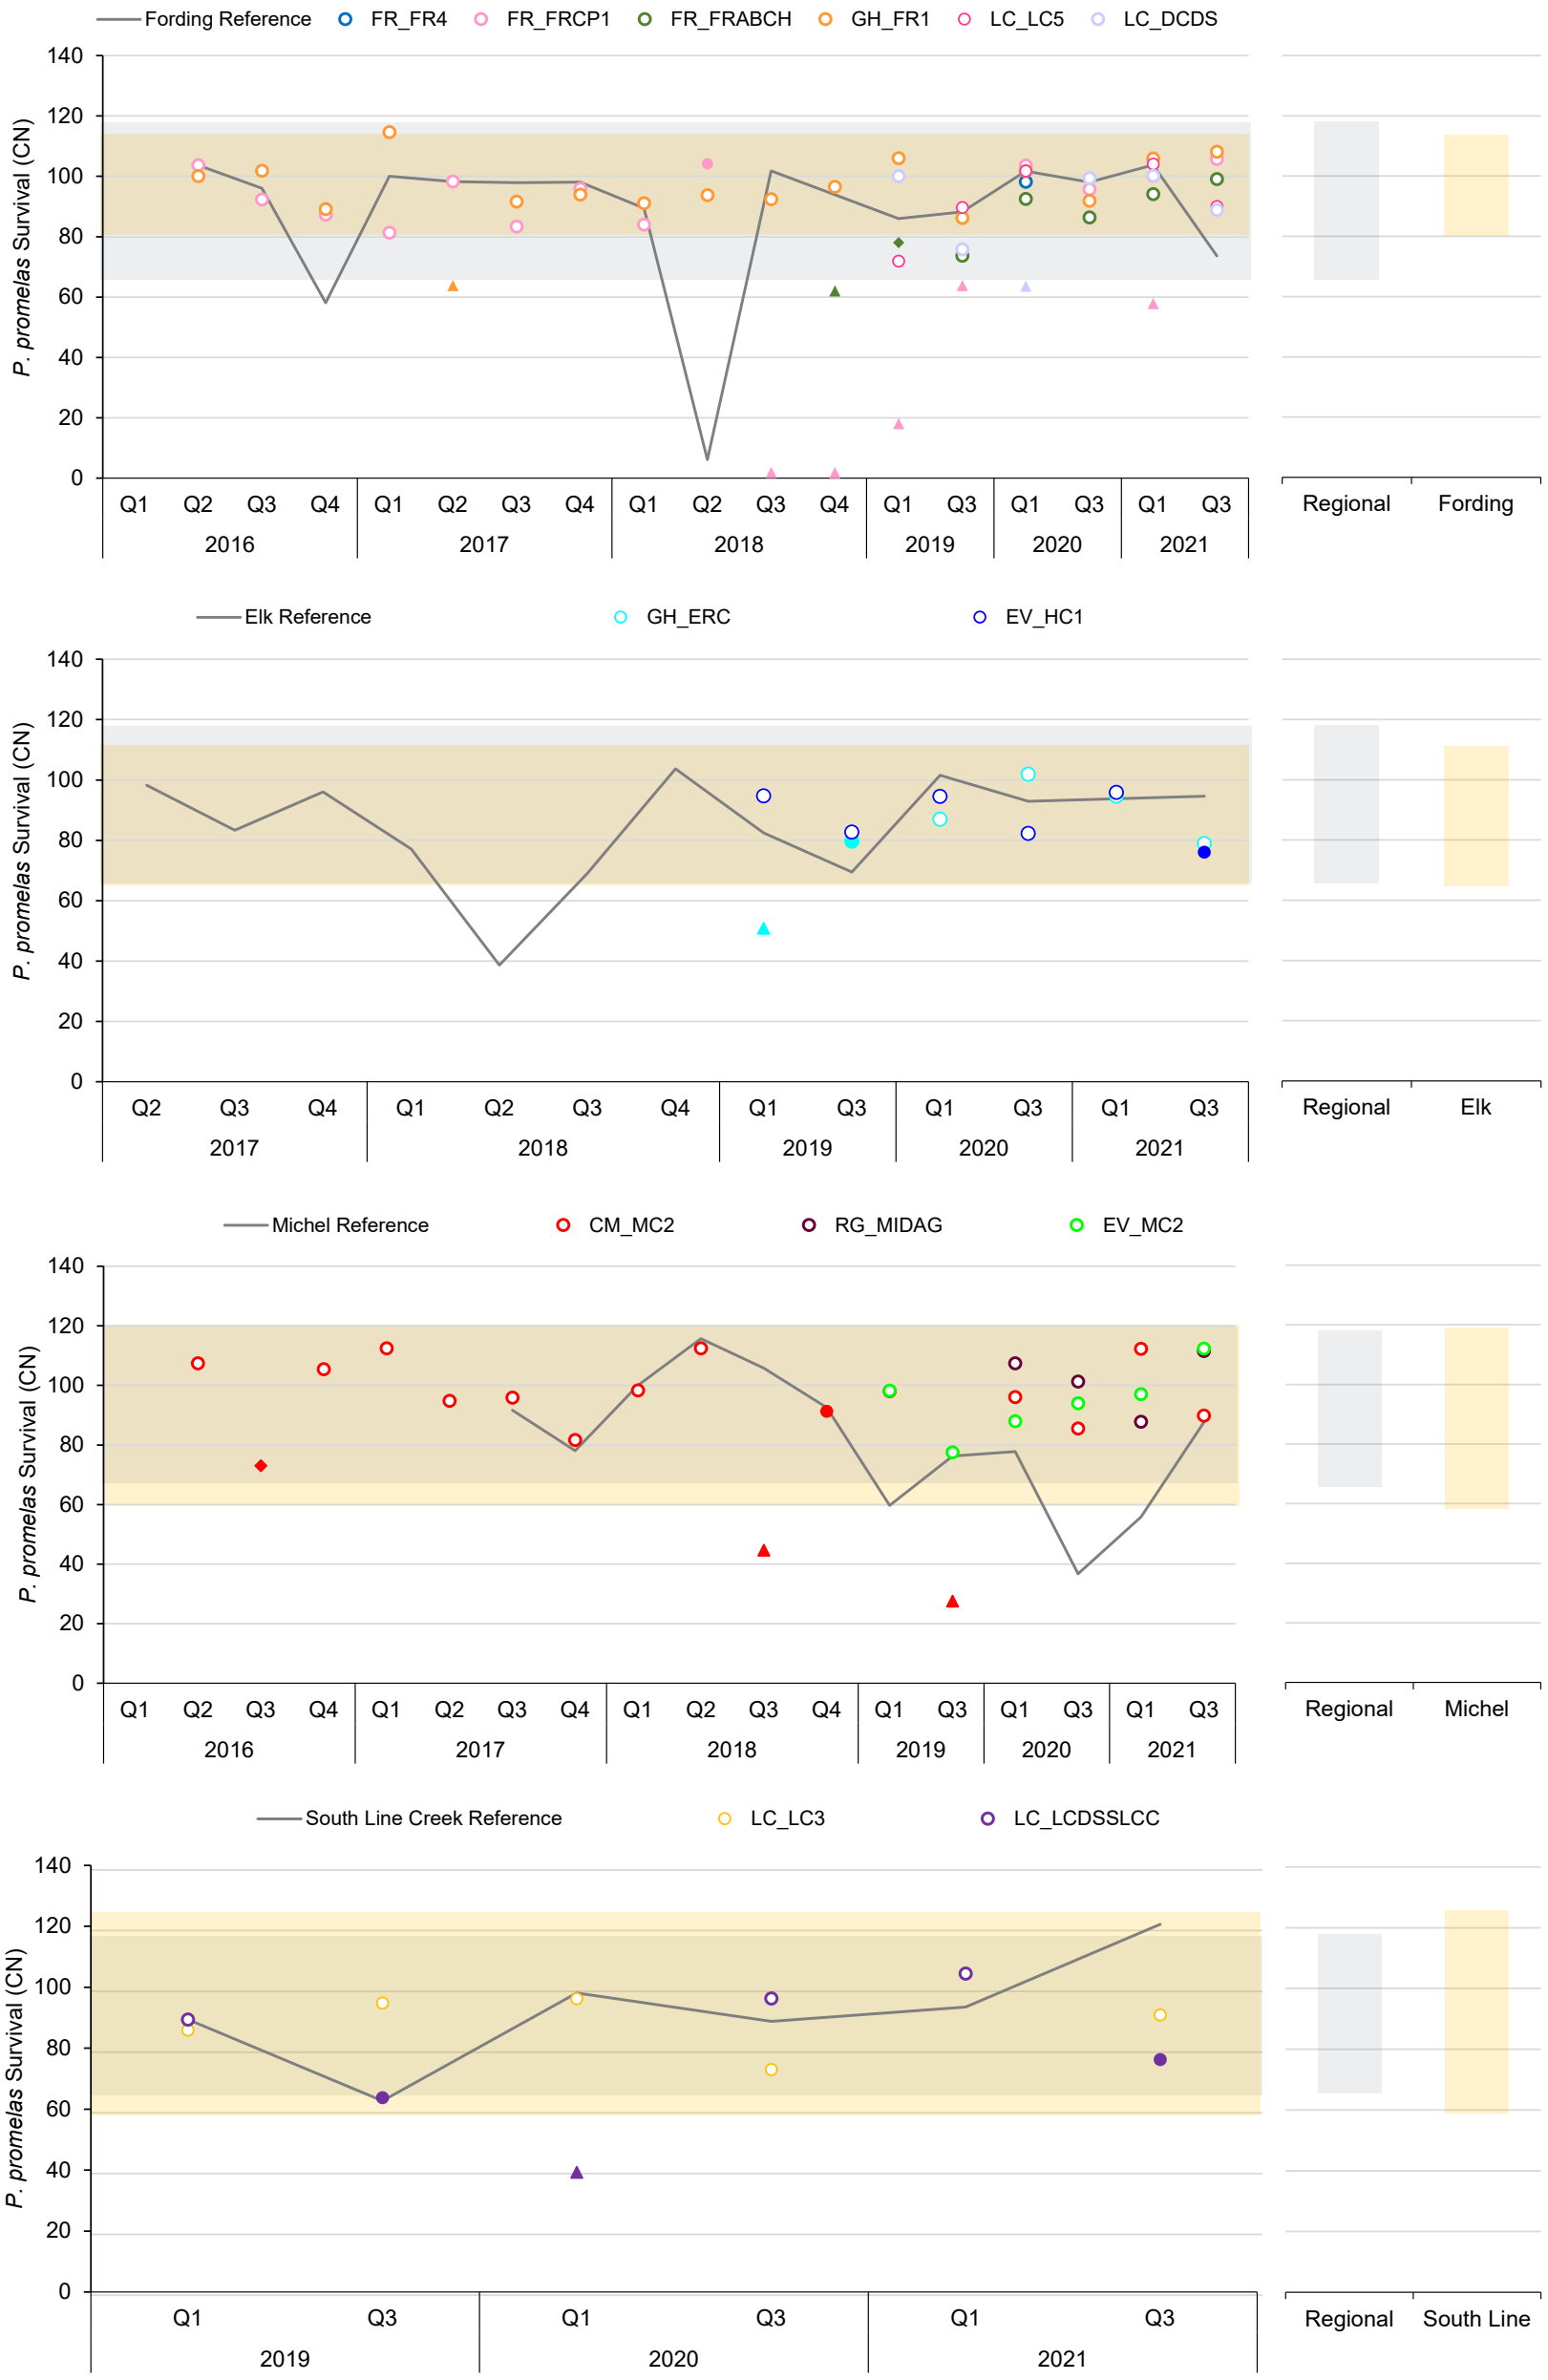
Note: See Figure 2.3-3 for description of lines and symbols. Test sites were compared to their paired local NR (Section 2.3.3). Evidence of microbes were observed in Q2 FR_UFR1, GH_ER2, CM_MC1, LC_SLC, FR_FRABCH, GH_FR1, LC_LC5, LC_DCDS, GH_ER2, CM_MC2, EV_MC2, and LC_LC3, and Q4 FR_FRCP1, FR_FRABCH, GH_FR1, LC_DCDS, GH_ERC, and CM_MC2 *O. mykiss* tests (Section 3.1).

Figure G-10: Mean results for *P. promelas* hatch in the Fording River reference and its paired test site waters (top left panel) and the Elk River reference and its paired test site waters (middle left panel), and the Michel Creek reference and its paired test site waters (bottom left panel). Regional and local normal ranges (2.5th to 97.5th percentile) are shown as bars (right panels).



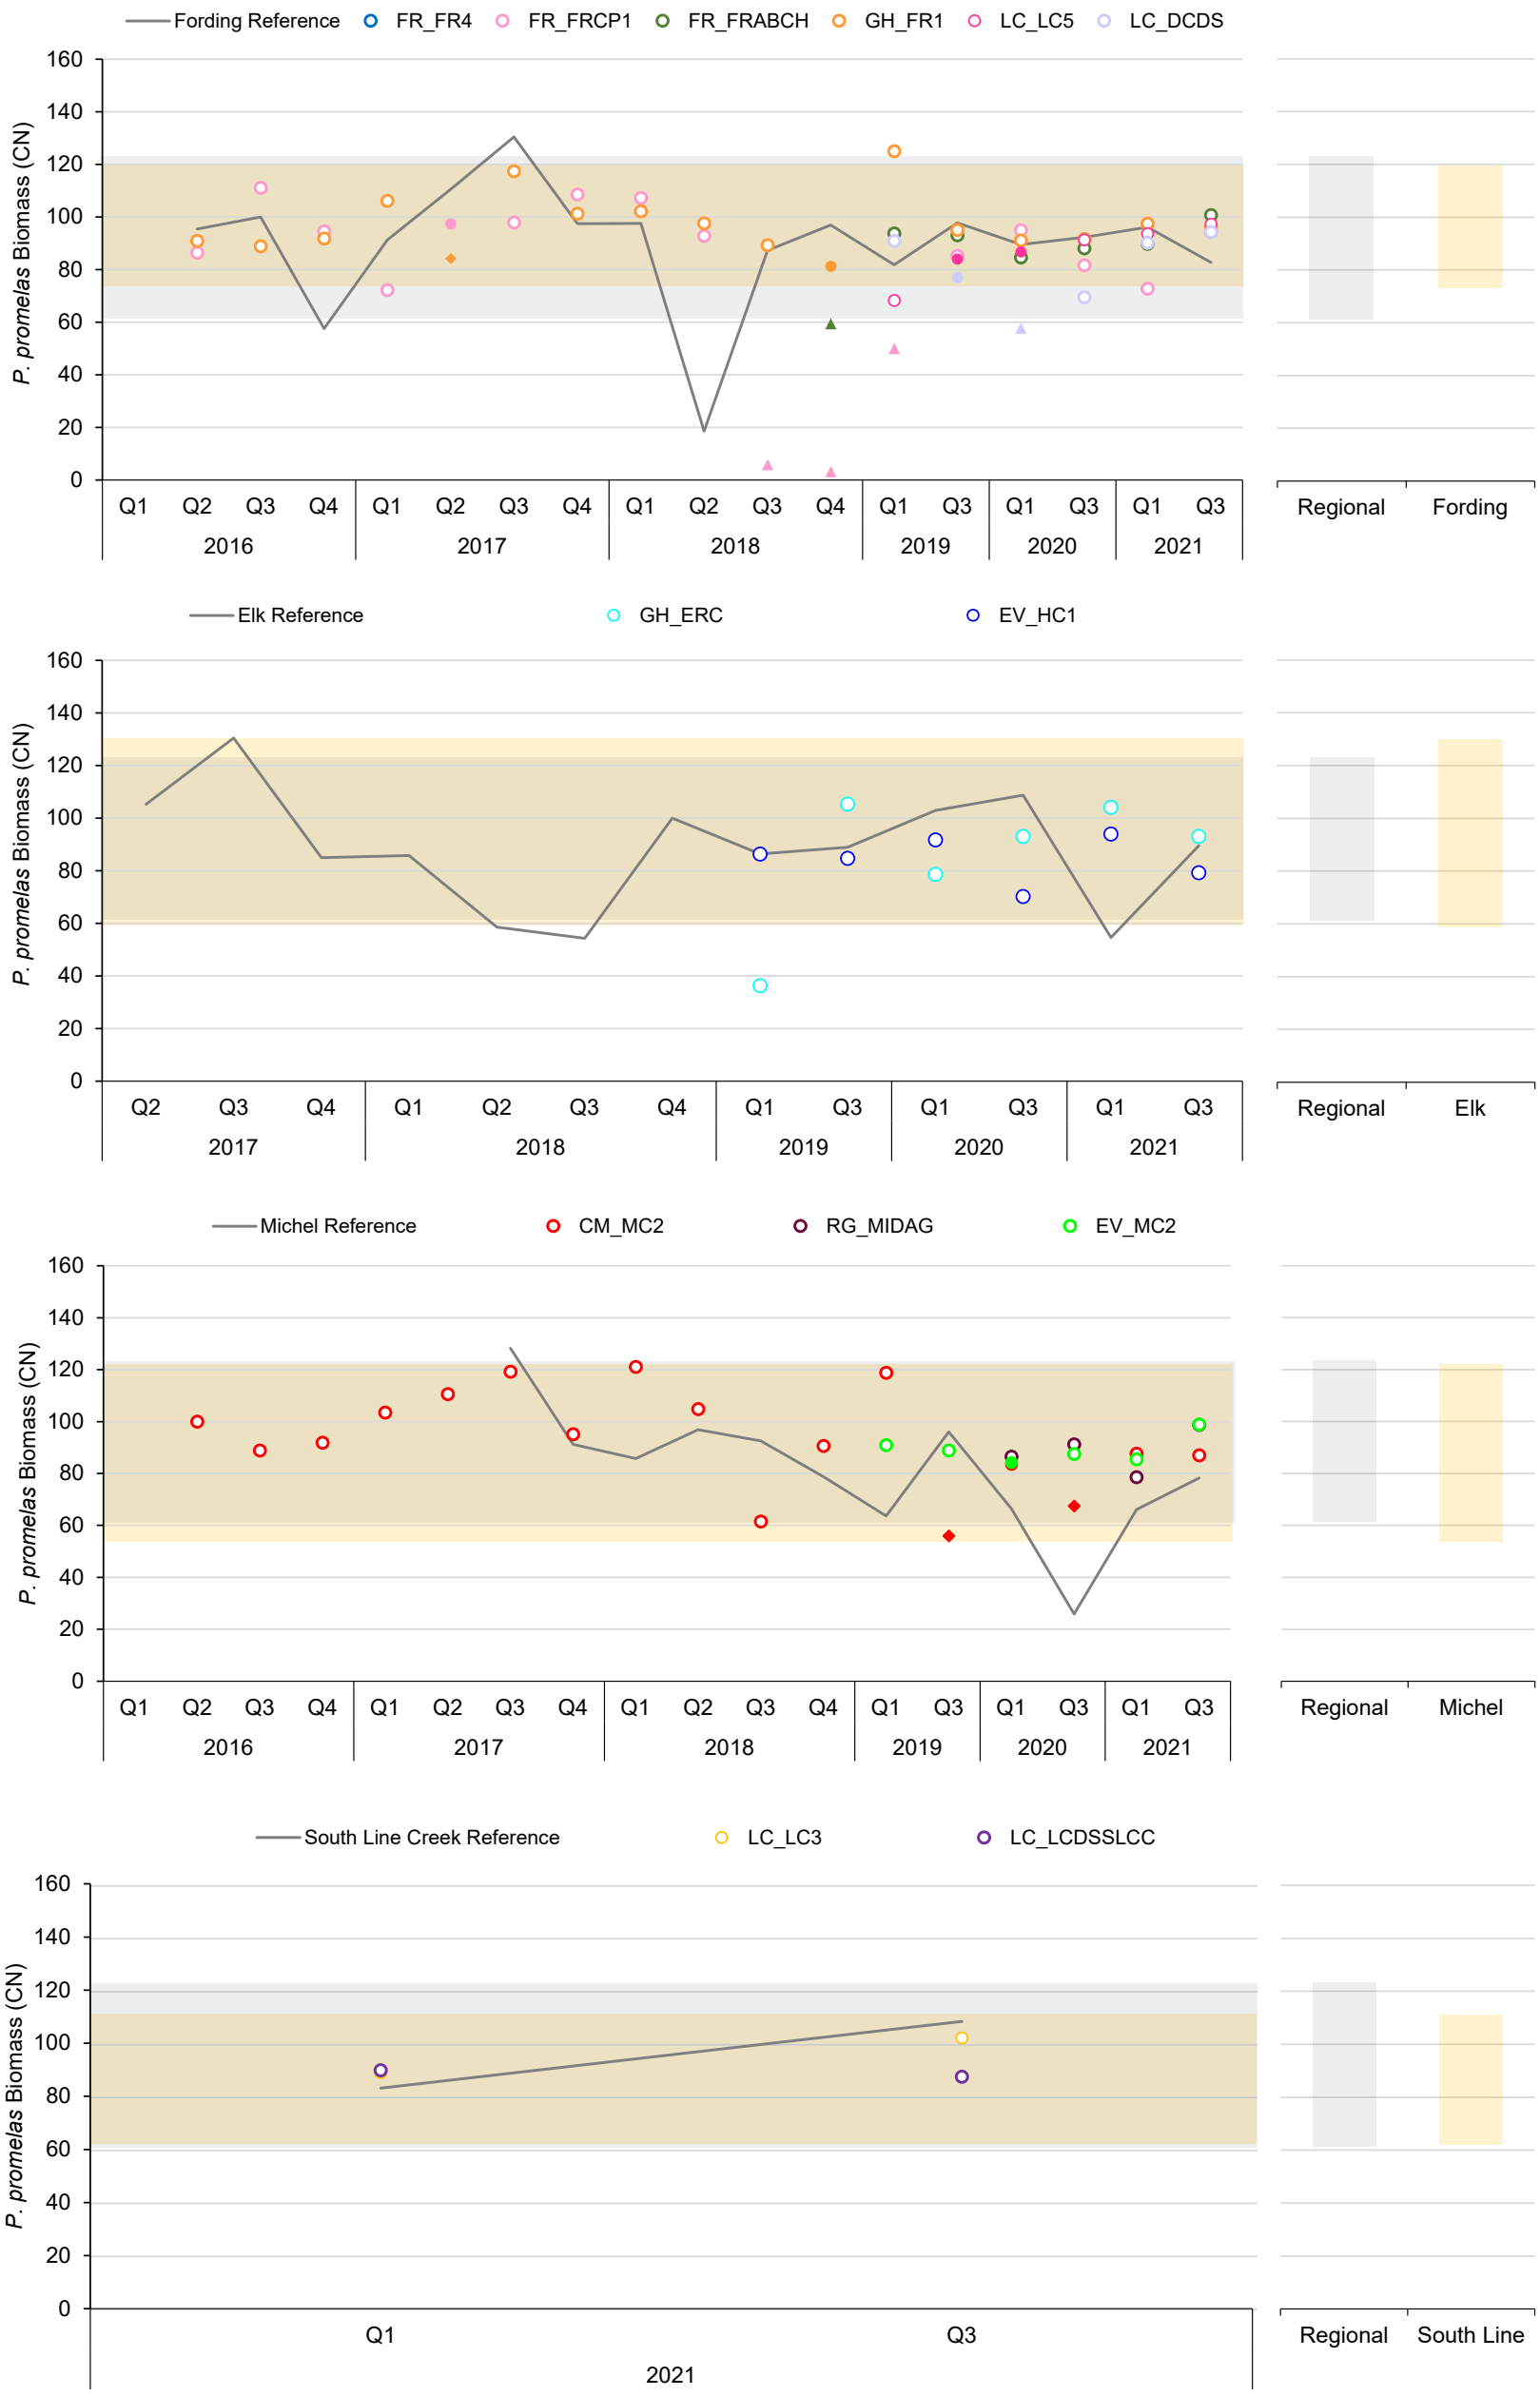
Note: See Figure 2.3-3 for description of lines and symbols. Test sites were compared to their paired local NR (Section 2.3.3). Evidence of microbes were observed in Q1 FR_FRABCH, EV_MC2, and LC_LCDSSLCC, and Q3 GH_ER2, FR_FRABCH, and CM_MC2 *P. promelas* tests (Section 3.1).

Figure G-11: Mean results for *P. promelas* survival in the Fording River reference and its paired test site waters (top left panel) and the Elk River reference and its paired test site waters (middle left panel), and the Michel Creek reference and its paired test site waters (bottom left panel). Regional and local normal ranges (2.5th to 97.5th percentile) are shown as bars (right panels).



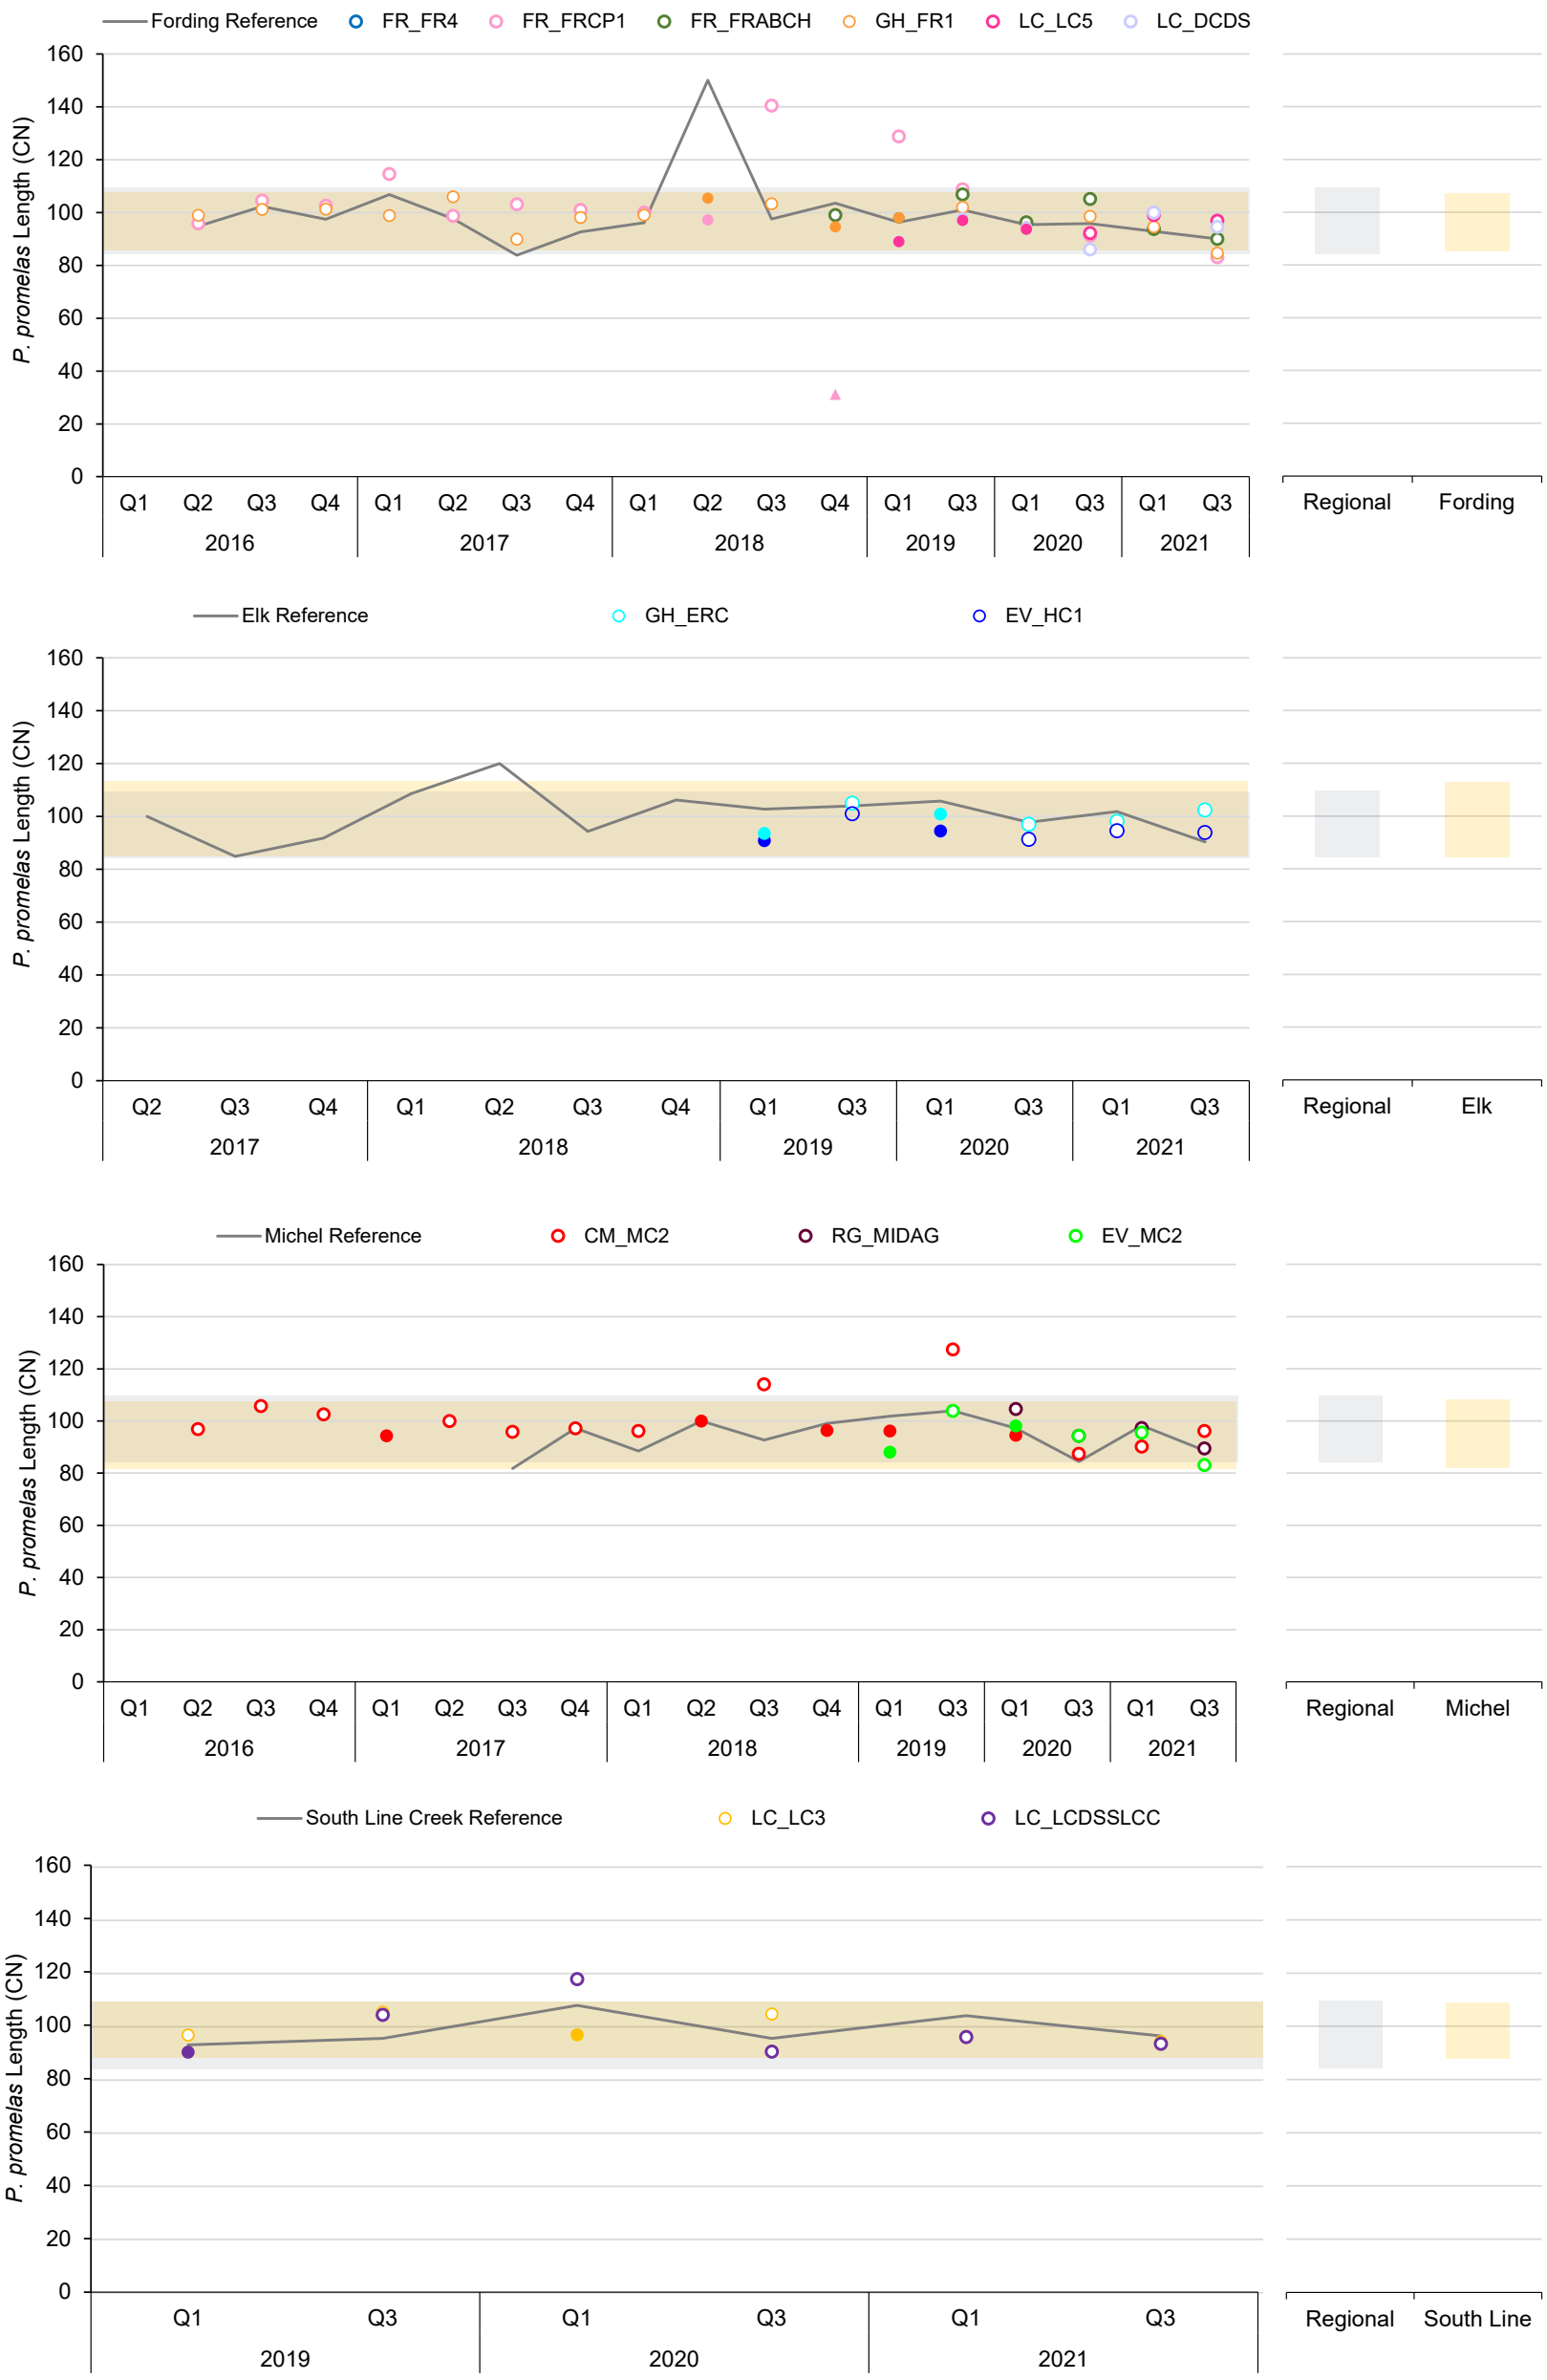
Note: See Figure 2.3-3 for description of lines and symbols. Test sites were compared to their paired local NR (Section 2.3.3). Evidence of microbes were observed in Q1 FR_FRABCH, EV_MC2, and LC_LCDSSLCC, and Q3 GH_ER2, FR_FRABCH, and CM_MC2 *P. promelas* tests (Section 3.1).

Figure G-12: Mean results for *P. promelas* biomass in the Fording River reference and its paired test site waters (top left panel) and the Elk River reference and its paired test site waters (middle left panel), and the Michel Creek reference and its paired test site waters (bottom left panel). Regional and local normal ranges (2.5th to 97.5th percentile) are shown as bars (right panels).



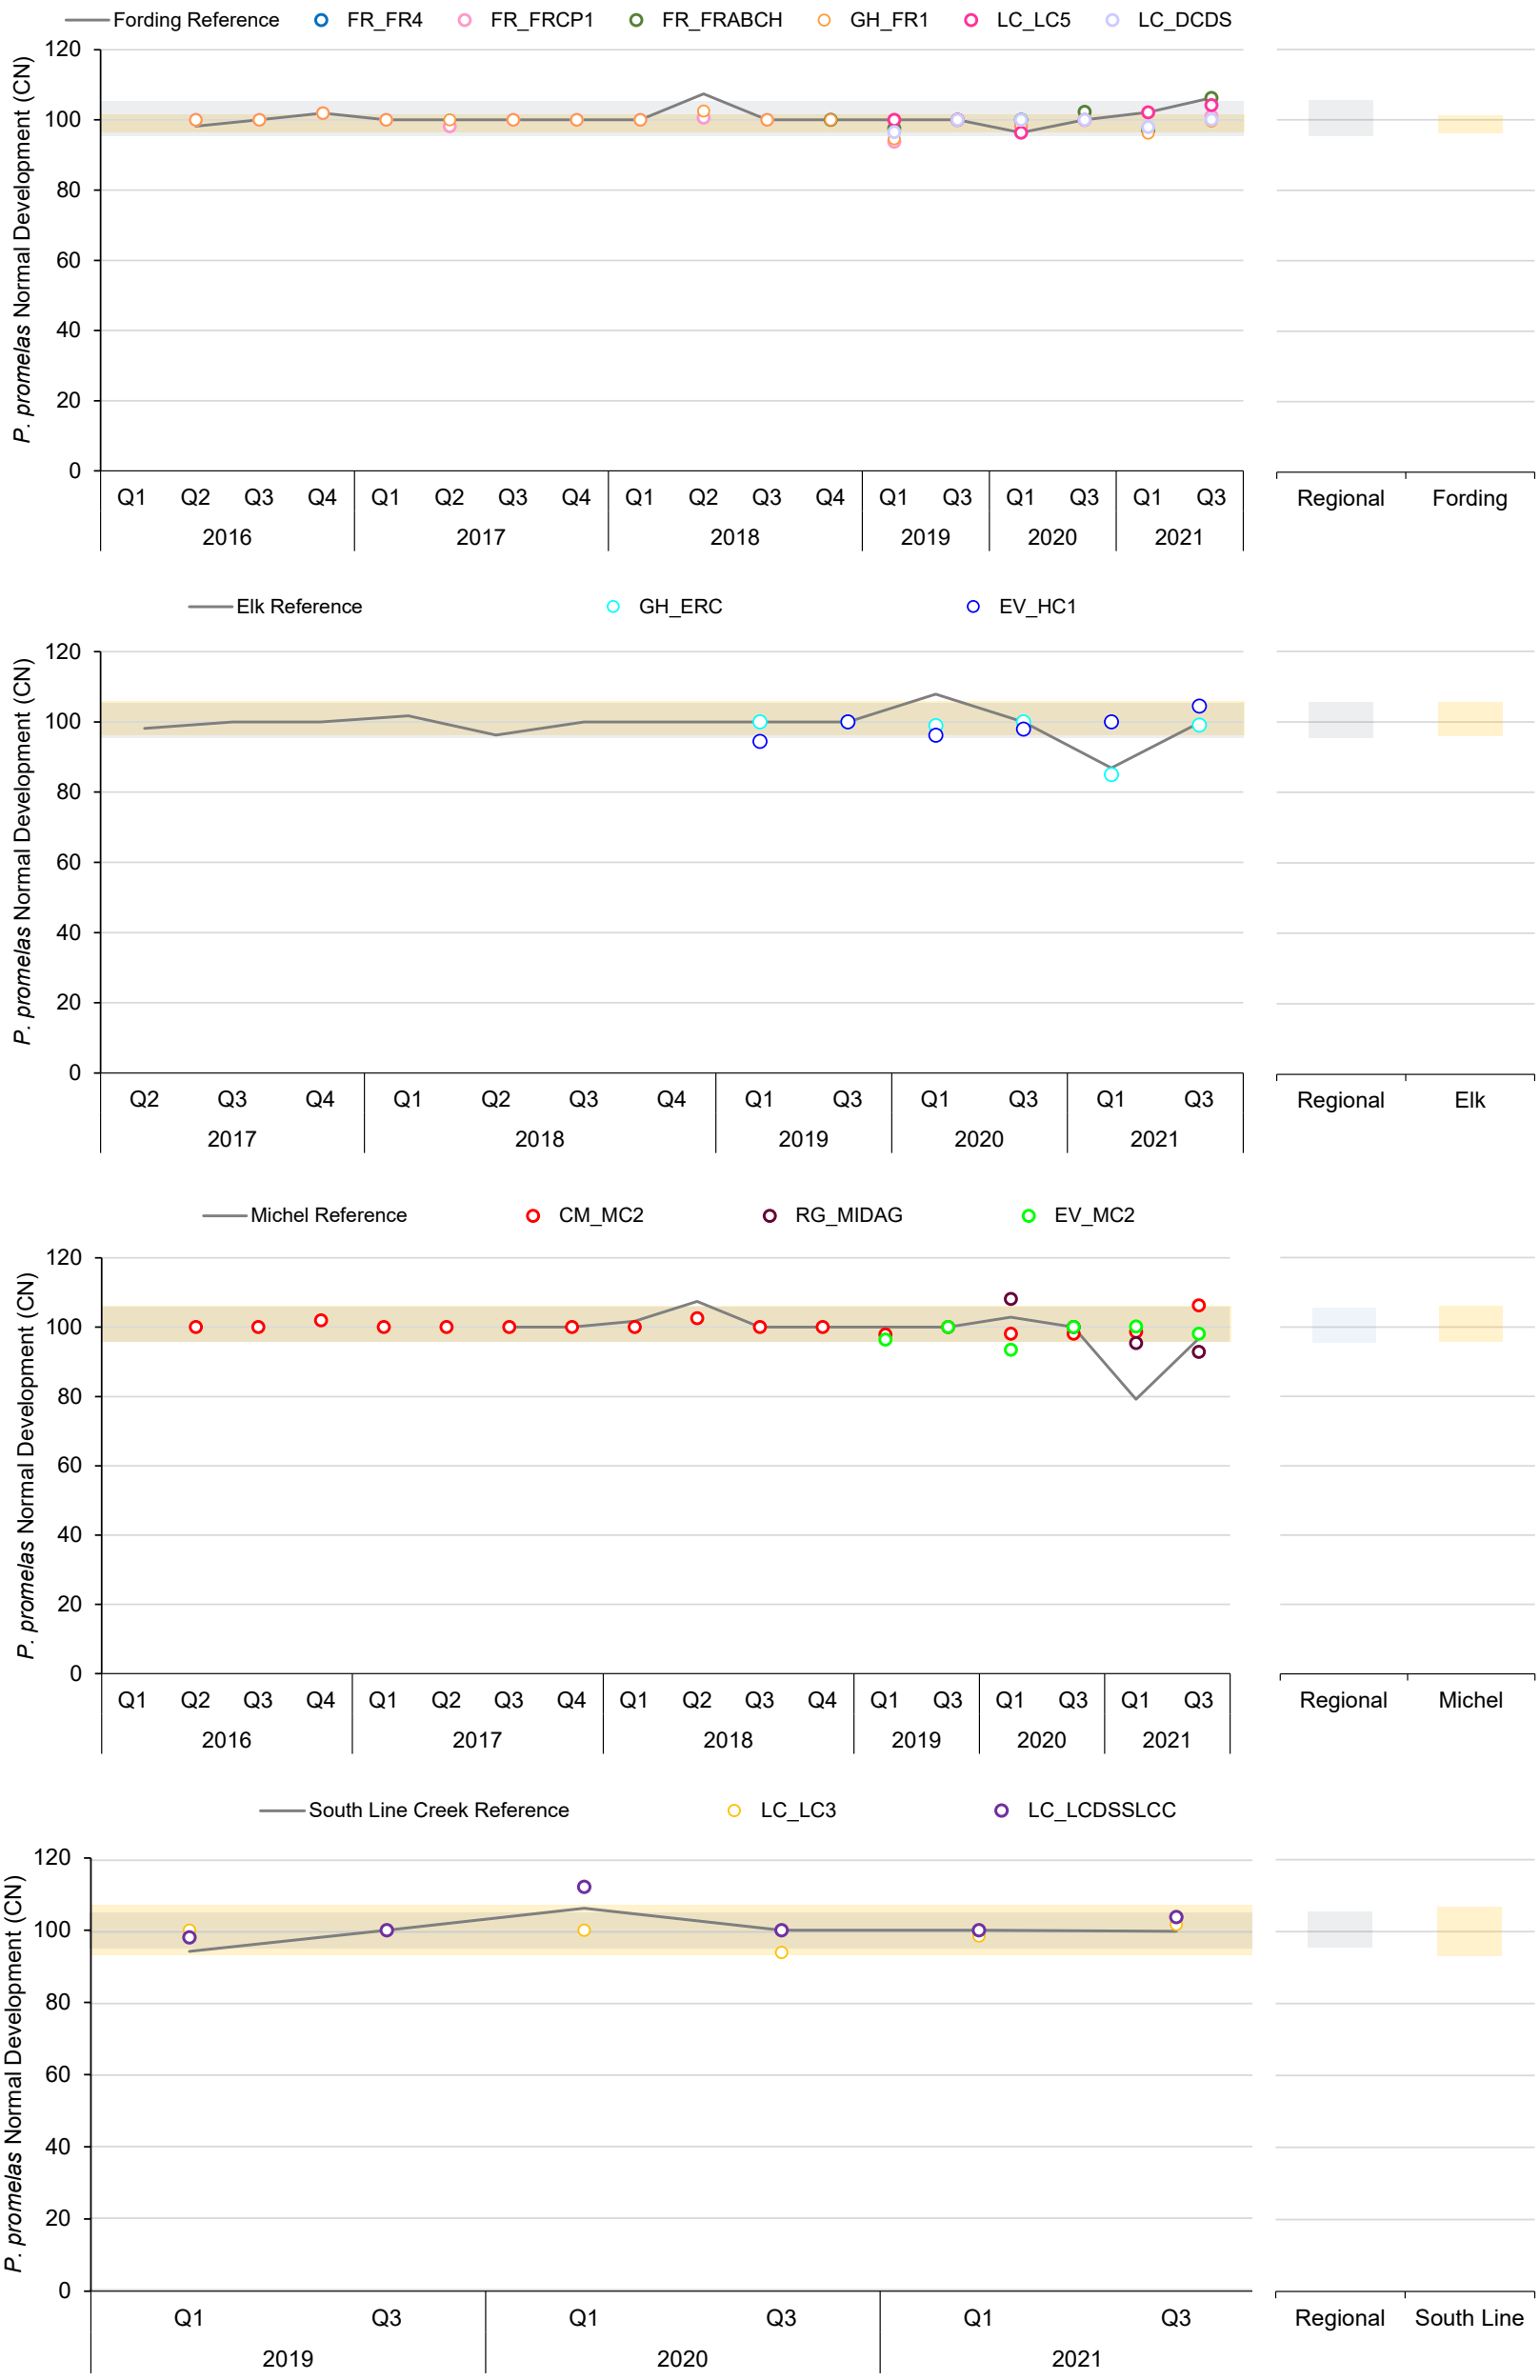
Note: See Figure 2.3-3 for description of lines and symbols. Test sites were compared to their paired local NR (Section 2.3.3). Evidence of microbes were observed in Q1 FR_FRABCH, EV_MC2, and LC_LCDSSLCC, and Q3 GH_ER2, FR_FRABCH, and CM_MC2 *P. promelas* tests (Section 3.1).

Figure G-13: Mean results for *P. promelas* length in the Fording River reference and its paired test site waters (top left panel) and the Elk River reference and its paired test site waters (middle left panel), and the Michel Creek reference and its paired test site waters (bottom left panel). Regional and local normal ranges (2.5th to 97.5th percentile) are shown as bars (right panels).



Note: See Figure 2.3-3 for description of lines and symbols. Test sites were compared to their paired local NR (Section 2.3.3). Evidence of microbes were observed in Q1 FR_FRABCH, EV_MC2, and LC_LCDSSLCC, and Q3 GH_ER2, FR_FRABCH, and CM_MC2 *P. promelas* tests (Section 3.1).

Figure G-14: Mean results for *P. promelas* normal development in the Fording River reference and its paired test site waters (top left panel) and the Elk River reference and its paired test site waters (middle left panel), and the Michel Creek reference and its paired test site waters (bottom left panel). Regional and local normal ranges (2.5th to 97.5th percentile) are shown as bars (right panels).



Note: See Figure 2.3-3 for description of lines and symbols. Test sites were compared to their paired local NR (Section 2.3.3). Evidence of microbes were observed in Q1 FR_FRABCH, EV_MC2, and LC_LCDSSLCC, and Q3 GH_ER2, FR_FRABCH, and CM_MC2 *P. promelas* tests (Section 3.1).
