Re: Regional Effects Program

Dear Mike Pope,

On May 5, 2022, Brooks Applied Labs (BAL) received twenty (20) aqueous samples. The samples were logged-in for total recoverable selenium [Se], dissolved Se [Se], and Se speciation analyses, according to the chain-of-custody (COC) forms.

The **Collection Dates** listed on the chain-of-custody (COC) forms did not match the corresponding **Collection Date** values provided on container labels for 2205072-14, 2205072-15, and 2205072-27. The discrepancies are described in the table below.

Laboratory ID	Sample ID	Collection Date (From COC)	Collection Date (From Container Label)
2205072-14	RG_MIDER_WS_LAEMP_EVO_2022-04_NP_NAL	04/25/22	04/26/22
2205072-15	RG_MIDER_WS_LAEMP_EVO_2022-04_NP_NAL	04/25/22	04/26/22
2205072-27	RG_ERCKBR_WS_LAEMP_EVO_2022-04_NP_NAL	04/28/22	04/27/22

2205072-14, 2205072-15, and 2205072-27 were logged and reported in using the **Collection Date** values listed on the COC forms (*column 3 in the table above*).

The sample fractions for total recoverable Se and dissolved Se were not preserved in the field. The samples were preserved (pH < 2) upon receipt at BAL. All sample fractions for total recoverable Se and dissolved Se were preserved within the (14 calendar day) preservation holding time.

The sample fractions logged in for Se speciation and dissolved Se had been field-filtered prior to receipt at BAL. All samples were stored according to BAL SOPs.

Total Recoverable Se and Dissolved Se

Each aqueous sample fraction for dissolved Se was digested in a closed vessel (bomb) with nitric and hydrochloric acids. The resulting digests were analyzed for Se content via inductively coupled plasma triple quadrupole mass spectrometry (ICP-QQQ-MS). The ICP-QQQ-MS instrumentation uses advanced interference removal techniques to ensure accuracy of the sample results. For more information, please visit the *Interference Reduction Technology* section on our website, brooksapplied.com.

Selenium Speciation

Each aqueous sample was analyzed for selenium speciation using ion chromatography inductively coupled plasma collision reaction cell mass spectrometry (IC-ICP-CRC-MS). Selenium species are chromatographically separated on an ion exchange column and then quantified using inductively coupled plasma collision reaction cell mass spectrometry (ICP-CRC-MS); for more information on this determinative technique, please visit the *Interference Reduction Technology* section on our website. The chromatographic method applied for the analyses provides greater retention of methylseleninic acid and selenomethionine, allowing for more definitive quantitation of these species.

In accordance with the quotation issued for this project, selenium speciation was defined as dissolved selenite [Se(IV)], selenate [Se(VI)], selenocyanate [SeCM], methylseleninic acid [MeSe(IV)], methaneselenonic acid [MeSe(VI)], selenomethionine [SeMet], selenosulfate [SeSO₃], and dimethylselenoxide [DMSeO]. Unknown Se species was defined as the total concentration of all unknown Se species observed during the analysis. This item is identified on the report as [Unk Se Sp].

DMSeO elutes early in the chromatographic run due to the nature of the molecule and the applied chromatographic separation method. Since this species elutes near the dead volume, additional selenium species may coelute. Alternate methods can be applied, upon client request, to increase the separation of DMSeO from potentially co-eluting selenium species.

Poor mass balance was observed for samples *RG_RIVER_WS_LAEMP_EVO_2022-04_NP* and *RG_ERCKBR_WS_LAEMP_EVO_2022-04_NP* when the Se speciation results (2205072-19 and 2205072-25, respectively) were compared to corresponding dissolved Se results (2205072-20 and 2205072-26, respectively). Container labels were checked and there was no indication of samples mis-labeled. Re-analyses confirmed the results for these samples, suggesting sampling heterogeneity. Consequently, no additional corrective actions are necessary. Results for these samples are reported from initial injections, and the reported results are deemed representative of the submitted containers.

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

In instances where a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample concentration, the recoveries and the relative percent difference (RPD) are not considered valid indicators of data quality. In such instances, the recoveries of the laboratory fortified blanks (BS) and/or standard reference materials (SRM) demonstrate the accuracy of the applied methods. When the spiking level was less than 25% of the native sample concentration, the spike recovery was not reported (**NR**) and the relative percent difference (RPD) of the MS/MSD set was not calculated (**N/C**).

In cases when either the native sample concentration was non-detectable (reported as less than or equal to the MDL) and/or the corresponding DUP result was also non-detectable, the RPD between the two values was not calculated (**N/C**).

Except for concentration qualifiers, all data were reported without qualification. All associated quality control sample results met the acceptance criteria.

BAL, an accredited laboratory, certifies that the reported results of all analyses for which BAL is NELAP accredited meet all NELAP requirements. For more information, please see the *Report Information* page.

Please feel free to contact us if you have any questions regarding this report.

Sincerely,

A handwritten signature in black ink, appearing to read 'Jeremy Maute', written in a cursive style.

Report Information

Laboratory Accreditation

BAL is accredited by the *National Environmental Laboratory Accreditation Program* (NELAP) through the State of Florida Department of Health, Bureau of Laboratories (E87982) and is certified to perform many environmental analyses. BAL is also certified by many other states to perform environmental analyses. For a current list of our accreditations/certifications, please visit our website at <http://www.brooksapplied.com/resources/certificates-permits/> or review Tables 1 and 2 in our Accreditation Information. Results reported relate only to the samples listed in the report.

Field Quality Control Samples

Please be notified that certain EPA methods require the collection of field quality control samples of an appropriate type and frequency; failure to do so is considered a deviation from some methods and for compliance purposes should only be done with the approval of regulatory authorities. Please see the specific EPA methods for details regarding required field quality control samples.

Common Abbreviations

AR	as received	MS	matrix spike
BAL	Brooks Applied Labs	MSD	matrix spike duplicate
BLK	method blank	ND	non-detect
BS	blank spike	NR	non-reportable
CAL	calibration standard	N/C	not calculated
CCB	continuing calibration blank	PS	post preparation spike
CCV	continuing calibration verification	REC	percent recovery
COC	chain of custody record	RPD	relative percent difference
D	dissolved fraction	SCV	secondary calibration verification
DUP	duplicate	SOP	standard operating procedure
IBL	instrument blank	SRM	reference material
ICV	initial calibration verification	T	total fraction
MDL	method detection limit	TR	total recoverable fraction
MRL	method reporting limit		

Definition of Data Qualifiers

(Effective 3/23/2020)

E	An estimated value due to the presence of interferences. A full explanation is presented in the narrative.
H	Holding time and/or preservation requirements not met. Please see narrative for explanation.
J	Detected by the instrument, the result is > the MDL but ≤ the MRL. Result is reported and considered an estimate.
J-1	Estimated value. A full explanation is presented in the narrative.
M	Duplicate precision (RPD) was not within acceptance criteria. Please see narrative for explanation.
N	Spike recovery was not within acceptance criteria. Please see narrative for explanation.
R	Rejected, unusable value. A full explanation is presented in the narrative.
U	Result is ≤ the MDL or client requested reporting limit (CRRL). Result reported as the MDL or CRRL.
X	Result is not BLK-corrected and is within 10x the absolute value of the highest detectable BLK in the batch. Result is estimated.
Z	Holding time and/or preservation requirements not established for this method; however, BAL recommendations for holding time were not followed. Please see narrative for explanation.

These qualifiers are based on those previously utilized by Brooks Applied Labs, those found in the EPA SOW ILM03.0, Exhibit B, Section III, pg. B-18, and the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review; USEPA; January 2010. These supersede all previous qualifiers ever employed by BAL.

Subject: Brooks Samples Received - WO (2205072, 2205073, 2205074, 2205075), REP - Privileged and Confidential

Good Morning,

This is confirmation that samples from the REP project were received at Brooks Applied Labs on May 5th, 2022. The samples were logged in for the following turnaround times (TATs):

WO 2205072 – (5-9 business day) TAT

WO 2205073 – (5-9 business day) TAT

WO 2205074 – (5-9 business day) TAT

WO 2205075 – (5-9 business day) TAT

The COC for WO 2205072 and WO 2205073 stated that the speciation fractions had been filtered in the field, however the speciation fractions received did not specifically state that they had been filtered on the label. Upon inspection of the samples which had minimal to no particulates to the naked eye, determined that the speciated fractions had been filtered. We therefore went with what was written on the COC and no extra filtration was done upon receipt. Please let us know if you would have us do differently.

All samples were filtered – and I will make sure our team knows to check this in the field.

The **sample date** value listed on the chain-of-custody (COC) form did not exactly match the corresponding **sample date** terms listed on container labels for samples in WO 2205072 and WO 2205074. The discrepancies are described in the table below.

Laboratory ID	Sample Name (on COC)	Sample Date (on COC)	Sample Date (on Sample)	Analysis
2205072-14	RG_MIDER_WS_LAEMP_EVO_2022-04_NP_NAL	04/25/22	04/26/22	Dissolved Recoverable Se
2205072-15	RG_MIDER_WS_LAEMP_EVO_2022-04_NP_NAL	04/25/22	04/26/22	Total Recoverable Se
2205072-27	RG_ERCKBR_WS_LAEMP_EVO_2022-04_NP_NAL	04/28/22	04/27/22	Total Recoverable Se
2205074-03	RG_ERCK_WS_LAEMP_EVO_2022-03_NP	04/28/22	04/27/22	Dissolved Recoverable Se

The samples described the table above were logged in using the **sample date** terms listed on the COC form. Please let us know if you would have us report any of these samples in a different manner.

Please use the sample date that I have highlighted.

A set of samples in WO 2205072 (described in the table below) are present twice on the COCs provided. We have received only one set of samples that matches their description and have logged them under this WO. Please let us know if you would have us do differently.

Laboratory - ID	Sample Name (on COC)	Analysis
2205072-01	RG_ERCKMD_WS_LAEMP_EVO_2022-03_NP	Se Speciation
2205072-02	RG_ERCKMD_WS_LAEMP_EVO_2022-03_NP_NAL	Dissolved Recoverable Se
2205072-03	RG_ERCKMD_WS_LAEMP_EVO_2022-03_NP_NAL	Total Recoverable Se

Sorry – this was an accident and was repeated in the COC.

The **sample name** value listed on the chain-of-custody (COC) form did not exactly match the corresponding **sample name** terms listed on container labels for samples in WO 2205074. The discrepancies are described in the table below.

Laboratory ID	Sample Name (on COC)	Sample Name (on Sample)	Analysis
2205074-01	RG_ERCKMD_WS_LAEMP_EVO_2022-03_NP	RG_ERCKMD_WS_LAEMP_EVO_2022-04_NP	Volatile Se

The samples described the table above were logged in using the **sample name** terms listed on the COC form. Please let us know if you would have us report any of these samples in a different manner.

Please use the sample date that I have highlighted.

Several samples in WO 2205074 and WO 2205075 (described in the table below) arrived wet and smelling strongly of alcohol. We observed no cracks in the vials, the caps were not loose, and the samples appeared to have been filled to the top.

Laboratory - ID	Sample Name (on COC)	Analysis
2205074-06	RG_RIVER_WS_LAEMP_EVO_2022-04_NP	Volatile Se
2205074-07	RG_ALUSM_WS_LAEMP_EVO_2022-04_NP	Volatile Se
2205074-08	RG_ERCKBR_WS_LAEMP_EVO_2022-04_NP	Volatile Se
2205075-01	RG_ERCKIG_WS_LAEMP_EVO_2022-04_NP	Volatile Se

Thank you for this observation. We are unaware of why this may have occurred. We will flag this when we analyze the results.

I've attached copies of the COC forms. If you have any questions, please contact the project manager, Jeremy Maute.

Thank You,
Anaïs Gentilhomme

Re: Regional Effects Program

Dear Mike Pope,

On May 5, 2022, Brooks Applied Labs (BAL) received ten (10) aqueous samples. The samples were logged-in for total recoverable selenium [Se], dissolved Se [Se], and Se speciation analyses, according to the chain-of-custody (COC) form.

The sample fractions for total recoverable Se and dissolved Se were not preserved in the field. The samples were preserved (pH < 2) upon receipt at BAL. All sample fractions for total recoverable Se and dissolved Se were preserved within the (14 calendar day) preservation holding time.

The sample fractions logged in for Se speciation and dissolved Se had been field-filtered prior to receipt at BAL. All samples were stored according to BAL SOPs.

Total Recoverable Se and Dissolved Se

Each aqueous sample fraction for dissolved Se was digested in a closed vessel (bomb) with nitric and hydrochloric acids. The resulting digests were analyzed for Se content via inductively coupled plasma triple quadrupole mass spectrometry (ICP-QQQ-MS). The ICP-QQQ-MS instrumentation uses advanced interference removal techniques to ensure accuracy of the sample results. For more information, please visit the *Interference Reduction Technology* section on our website, brooksapplied.com.

Selenium Speciation

Each aqueous sample was analyzed for selenium speciation using ion chromatography inductively coupled plasma collision reaction cell mass spectrometry (IC-ICP-CRC-MS). Selenium species are chromatographically separated on an ion exchange column and then quantified using inductively coupled plasma collision reaction cell mass spectrometry (ICP-CRC-MS); for more information on this determinative technique, please visit the *Interference Reduction Technology* section on our website. The chromatographic method applied for the analyses provides greater retention of methylseleninic acid and selenomethionine, allowing for more definitive quantitation of these species.

In accordance with the quotation issued for this project, selenium speciation was defined as dissolved selenite [Se(IV)], selenate [Se(VI)], selenocyanate [SeCN], methylseleninic acid [MeSe(IV)], methaneselenonic acid [MeSe(VI)], selenomethionine [SeMef], selenosulfate [SeSO₃], and dimethylselenoxide [DMSeO]. Unknown Se species was defined as the total concentration of all unknown Se species observed during the analysis. This item is identified on the report as [Unk Se Sp].

DMSeO elutes early in the chromatographic run due to the nature of the molecule and the applied chromatographic separation method. Since this species elutes near the dead volume, additional selenium

species may coelute. Alternate methods can be applied, upon client request, to increase the separation of DMSeO from potentially co-eluting selenium species.

Poor mass balance was observed in *RG_ERCKIG_WS_LAEMP_EVO_2022-04_NP* when the Se speciation results (2205073-10) were compared to corresponding dissolved Se result (2205073-11). Container labels were checked and there was no indication of samples mis-labeled. Re-analyses confirmed the results. Consequently, no additional corrective actions are necessary. Results for these samples are reported from initial injections, and the reported results are deemed representative of the submitted containers.

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

In instances where a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample concentration, the recoveries and the relative percent difference (RPD) are not considered valid indicators of data quality. In such instances, the recoveries of the laboratory fortified blanks (BS) and/or standard reference materials (SRM) demonstrate the accuracy of the applied methods. When the spiking level was less than 25% of the native sample concentration, the spike recovery was not reported (**NR**) and the relative percent difference (RPD) of the MS/MSD set was not calculated (**N/C**).

In cases when either the native sample concentration was non-detectable (reported as less than or equal to the MDL) and/or the corresponding DUP result was also non-detectable, the RPD between the two values was not calculated (**N/C**).

Except for concentration qualifiers, all data were reported without qualification. All associated quality control sample results met the acceptance criteria.

BAL, an accredited laboratory, certifies that the reported results of all analyses for which BAL is NELAP accredited meet all NELAP requirements. For more information, please see the *Report Information* page.

Please feel free to contact us if you have any questions regarding this report.

Sincerely,

Jeremy Maute
Senior Project Manager
Jeremy@brooksapplied.com

Report Information

Laboratory Accreditation

BAL is accredited by the *National Environmental Laboratory Accreditation Program* (NELAP) through the State of Florida Department of Health, Bureau of Laboratories (E87982) and is certified to perform many environmental analyses. BAL is also certified by many other states to perform environmental analyses. For a current list of our accreditations/certifications, please visit our website at <http://www.brooksapplied.com/resources/certificates-permits/> or review Tables 1 and 2 in our Accreditation Information. Results reported relate only to the samples listed in the report.

Field Quality Control Samples

Please be notified that certain EPA methods require the collection of field quality control samples of an appropriate type and frequency; failure to do so is considered a deviation from some methods and for compliance purposes should only be done with the approval of regulatory authorities. Please see the specific EPA methods for details regarding required field quality control samples.

Common Abbreviations

AR	as received	MS	matrix spike
BAL	Brooks Applied Labs	MSD	matrix spike duplicate
BLK	method blank	ND	non-detect
BS	blank spike	NR	non-reportable
CAL	calibration standard	N/C	not calculated
CCB	continuing calibration blank	PS	post preparation spike
CCV	continuing calibration verification	REC	percent recovery
COC	chain of custody record	RPD	relative percent difference
D	dissolved fraction	SCV	secondary calibration verification
DUP	duplicate	SOP	standard operating procedure
IBL	instrument blank	SRM	reference material
ICV	initial calibration verification	T	total fraction
MDL	method detection limit	TR	total recoverable fraction
MRL	method reporting limit		

Definition of Data Qualifiers

(Effective 3/23/2020)

E	An estimated value due to the presence of interferences. A full explanation is presented in the narrative.
H	Holding time and/or preservation requirements not met. Please see narrative for explanation.
J	Detected by the instrument, the result is > the MDL but ≤ the MRL. Result is reported and considered an estimate.
J-1	Estimated value. A full explanation is presented in the narrative.
M	Duplicate precision (RPD) was not within acceptance criteria. Please see narrative for explanation.
N	Spike recovery was not within acceptance criteria. Please see narrative for explanation.
R	Rejected, unusable value. A full explanation is presented in the narrative.
U	Result is ≤ the MDL or client requested reporting limit (CRRL). Result reported as the MDL or CRRL.
X	Result is not BLK-corrected and is within 10x the absolute value of the highest detectable BLK in the batch. Result is estimated.
Z	Holding time and/or preservation requirements not established for this method; however, BAL recommendations for holding time were not followed. Please see narrative for explanation.

These qualifiers are based on those previously utilized by Brooks Applied Labs, those found in the EPA SOW ILM03.0, Exhibit B, Section III, pg. B-18, and the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review; USEPA; January 2010. These supersede all previous qualifiers ever employed by BAL.

Re: Regional Effects Program

Dear Mike Pope,

On May 5, 2022, Brooks Applied Labs (BAL) received ten (10) aqueous samples. The samples were logged-in for volatile selenium (Se) speciation analyses, in accordance with the chain-of-custody (COC) form.

The **Sample ID** value listed on the chain-of-custody (COC) form did not exactly match the corresponding **Sample ID** on the container label for 2205074-01. The discrepancy is described in the table below.

Laboratory ID	Sample ID (on COC form)	Sample ID (on container label)
2205074-01	RG_ERCKMD_WS_LAEMP_EVO_2022-03_NP	RG_ERCKMD_WS_LAEMP_EVO_2022-04_NP

Per client request, the field ID amended for reporting. The Sample ID changes are described in the table.

Per client request, the **Sample ID** described on the container label (*column 3 in the table above*) has been used for reporting 2205074-01. Since the field IDs listed on the COC form is not used for reporting 2205074-01, please refer to the **Sample ID** cross reference table for identification.

The **Collection Date** value listed on the chain-of-custody (COC) form did not match the corresponding **Collection Date** provided on container label for 2205074-03. The discrepancy is described in the table below.

Laboratory ID	Sample ID	Collection Date (From COC)	Collection Date (From Container Label)
2205074-03	RG_ERCK_WS_LAEMP_EVO_2022-03_NP	04/28/22	04/27/22

Per request, 2205074-03 was logged and reported in using the **Collection Date** value listed on the COC form (04/28/2022).

Each sample requesting volatile Se speciation had been field-filtered into bottles containing isopropanol preservative (provided by BAL).

The containers for 2205074-06, 2205074-07, and 2205074-08 arrived wet and the laboratory staff at BAL reported the smell of alcohol for these fractions. The vials for 2205074-06, 2205074-07, and 2205074-08 were intact, the caps were on securely, and each container was filled with zero headspace. The containers did not appear to be compromised, but liquid was observed, and evidence of isopropanol preservative was

present. This information should be considered when reviewing volatile selenium (Se) speciation results for these samples.

All sample fractions were stored according to BAL SOPs and EPA methodology.

Volatile Selenium Speciation

Each aqueous sample was analyzed for volatile selenium speciation using high performance liquid chromatography inductively coupled plasma collision reaction cell mass spectrometry (HPLC-ICP-CRC-MS). Volatile selenium species are chromatographically separated on a reversed phase column and then quantified using inductively coupled plasma collision reaction cell mass spectrometry (ICP-CRC-MS); for more information on this determinative technique, please visit the *Interference Reduction Technology* section on our website.

In accordance with the quotation issued for this project, volatile selenium species were defined as dissolved dimethylselenide [DMeSe] and dimethyldiselenide [DMDS₂].

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

In instances where a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample concentration, the recoveries and the relative percent difference (RPD) values are not considered valid indicators of data quality. In such instances, the recoveries of the laboratory fortified blank (BS) demonstrates the accuracy of the applied methods. When the spiking level was less than 25% of the native sample concentration, the spike recovery was not reported (**NR**) and the relative percent difference (RPD) of the MS/MSD set was not calculated (**NC**).

Except for concentration qualifiers, all data were reported without qualification. All associated quality control sample results met the acceptance criteria.

BAL, an accredited laboratory, certifies that the reported results of all analyses for which BAL is NELAP accredited meet all NELAP requirements. For more information, please see the *Report Information* page.

Please feel free to contact us if you have any questions regarding this report.

Sincerely,

Jeremy Maute

Senior Project Manager

Jeremy@brooksapplied.com

Report Information

Laboratory Accreditation

BAL is accredited by the *National Environmental Laboratory Accreditation Program* (NELAP) through the State of Florida Department of Health, Bureau of Laboratories (E87982) and is certified to perform many environmental analyses. BAL is also certified by many other states to perform environmental analyses. For a current list of our accreditations/certifications, please visit our website at <http://www.brooksapplied.com/resources/certificates-permits/> or review Tables 1 and 2 in our Accreditation Information. Results reported relate only to the samples listed in the report.

Field Quality Control Samples

Please be notified that certain EPA methods require the collection of field quality control samples of an appropriate type and frequency; failure to do so is considered a deviation from some methods and for compliance purposes should only be done with the approval of regulatory authorities. Please see the specific EPA methods for details regarding required field quality control samples.

Common Abbreviations

AR	as received	MS	matrix spike
BAL	Brooks Applied Labs	MSD	matrix spike duplicate
BLK	method blank	ND	non-detect
BS	blank spike	NR	non-reportable
CAL	calibration standard	N/C	not calculated
CCB	continuing calibration blank	PS	post preparation spike
CCV	continuing calibration verification	REC	percent recovery
COC	chain of custody record	RPD	relative percent difference
D	dissolved fraction	SCV	secondary calibration verification
DUP	duplicate	SOP	standard operating procedure
IBL	instrument blank	SRM	reference material
ICV	initial calibration verification	T	total fraction
MDL	method detection limit	TR	total recoverable fraction
MRL	method reporting limit		

Definition of Data Qualifiers

(Effective 3/23/2020)

E	An estimated value due to the presence of interferences. A full explanation is presented in the narrative.
H	Holding time and/or preservation requirements not met. Please see narrative for explanation.
J	Detected by the instrument, the result is > the MDL but ≤ the MRL. Result is reported and considered an estimate.
J-1	Estimated value. A full explanation is presented in the narrative.
M	Duplicate precision (RPD) was not within acceptance criteria. Please see narrative for explanation.
N	Spike recovery was not within acceptance criteria. Please see narrative for explanation.
R	Rejected, unusable value. A full explanation is presented in the narrative.
U	Result is ≤ the MDL or client requested reporting limit (CRRL). Result reported as the MDL or CRRL.
X	Result is not BLK-corrected and is within 10x the absolute value of the highest detectable BLK in the batch. Result is estimated.
Z	Holding time and/or preservation requirements not established for this method; however, BAL recommendations for holding time were not followed. Please see narrative for explanation.

These qualifiers are based on those previously utilized by Brooks Applied Labs, those found in the EPA SOW ILM03.0, Exhibit B, Section III, pg. B-18, and the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review; USEPA; January 2010. These supersede all previous qualifiers ever employed by BAL.

Subject: Brooks Samples Received - WO (2205072, 2205073, 2205074, 2205075), REP - Privileged and Confidential

Good Morning,

This is confirmation that samples from the REP project were received at Brooks Applied Labs on May 5th, 2022. The samples were logged in for the following turnaround times (TATs):

WO 2205072 – (5-9 business day) TAT

WO 2205073 – (5-9 business day) TAT

WO 2205074 – (5-9 business day) TAT

WO 2205075 – (5-9 business day) TAT

The COC for WO 2205072 and WO 2205073 stated that the speciation fractions had been filtered in the field, however the speciation fractions received did not specifically state that they had been filtered on the label. Upon inspection of the samples which had minimal to no particulates to the naked eye, determined that the speciated fractions had been filtered. We therefore went with what was written on the COC and no extra filtration was done upon receipt. Please let us know if you would have us do differently.

All samples were filtered – and I will make sure our team knows to check this in the field.

The **sample date** value listed on the chain-of-custody (COC) form did not exactly match the corresponding **sample date** terms listed on container labels for samples in WO 2205072 and WO 2205074. The discrepancies are described in the table below.

Laboratory ID	Sample Name (on COC)	Sample Date (on COC)	Sample Date (on Sample)	Analysis
2205072-14	RG_MIDER_WS_LAEMP_EVO_2022-04_NP_NAL	04/25/22	04/26/22	Dissolved Recoverable Se
2205072-15	RG_MIDER_WS_LAEMP_EVO_2022-04_NP_NAL	04/25/22	04/26/22	Total Recoverable Se
2205072-27	RG_ERCKBR_WS_LAEMP_EVO_2022-04_NP_NAL	04/28/22	04/27/22	Total Recoverable Se
2205074-03	RG_ERCK_WS_LAEMP_EVO_2022-03_NP	04/28/22	04/27/22	Dissolved Recoverable Se

The samples described the table above were logged in using the **sample date** terms listed on the COC form. Please let us know if you would have us report any of these samples in a different manner.

Please use the sample date that I have highlighted.

A set of samples in WO 2205072 (described in the table below) are present twice on the COCs provided. We have received only one set of samples that matches their description and have logged them under this WO. Please let us know if you would have us do differently.

Laboratory - ID	Sample Name (on COC)	Analysis
2205072-01	RG_ERCKMD_WS_LAEMP_EVO_2022-03_NP	Se Speciation
2205072-02	RG_ERCKMD_WS_LAEMP_EVO_2022-03_NP_NAL	Dissolved Recoverable Se
2205072-03	RG_ERCKMD_WS_LAEMP_EVO_2022-03_NP_NAL	Total Recoverable Se

Sorry – this was an accident and was repeated in the COC.

The **sample name** value listed on the chain-of-custody (COC) form did not exactly match the corresponding **sample name** terms listed on container labels for samples in WO 2205074. The discrepancies are described in the table below.

Laboratory ID	Sample Name (on COC)	Sample Name (on Sample)	Analysis
2205074-01	RG_ERCKMD_WS_LAEMP_EVO_2022-03_NP	RG_ERCKMD_WS_LAEMP_EVO_2022-04_NP	Volatile Se

The samples described the table above were logged in using the **sample name** terms listed on the COC form. Please let us know if you would have us report any of these samples in a different manner.

Please use the sample date that I have highlighted.

Several samples in WO 2205074 and WO 2205075 (described in the table below) arrived wet and smelling strongly of alcohol. We observed no cracks in the vials, the caps were not loose, and the samples appeared to have been filled to the top.

Laboratory - ID	Sample Name (on COC)	Analysis
2205074-06	RG_RIVER_WS_LAEMP_EVO_2022-04_NP	Volatile Se
2205074-07	RG_ALUSM_WS_LAEMP_EVO_2022-04_NP	Volatile Se
2205074-08	RG_ERCKBR_WS_LAEMP_EVO_2022-04_NP	Volatile Se
2205075-01	RG_ERCKIG_WS_LAEMP_EVO_2022-04_NP	Volatile Se

Thank you for this observation. We are unaware of why this may have occurred. We will flag this when we analyze the results.

I've attached copies of the COC forms. If you have any questions, please contact the project manager, Jeremy Maute.

Thank You,
Anaïs Gentilhomme

Re: Regional Effects Program

Dear Mike Pope,

On May 5, 2022, Brooks Applied Labs (BAL) received four (4) aqueous samples. The samples were logged-in for volatile selenium (Se) speciation analyses, in accordance with the chain-of-custody (COC) form.

Each sample requesting volatile Se speciation had been field-filtered into bottles containing isopropanol preservative (provided by BAL).

The container for 2205075-01 arrived wet and the laboratory staff at BAL reported the smell of alcohol for this fraction. The vial for 2205075-01 was intact, the cap was on securely. The container for 2205075-01 was filled with nearly zero headspace. The container did not appear to be compromised, but liquid was observed on the outside of the container, and evidence of isopropanol preservative was present. This information should be considered when reviewing volatile selenium (Se) speciation results for this sample.

All sample fractions were stored according to BAL SOPs and EPA methodology.

Volatile Selenium Speciation

Each aqueous sample was analyzed for volatile selenium speciation using high performance liquid chromatography inductively coupled plasma collision reaction cell mass spectrometry (HPLC-ICP-CRC-MS). Volatile selenium species are chromatographically separated on a reversed phase column and then quantified using inductively coupled plasma collision reaction cell mass spectrometry (ICP-CRC-MS); for more information on this determinative technique, please visit the *Interference Reduction Technology* section on our website.

In accordance with the quotation issued for this project, volatile selenium species were defined as dissolved dimethylselenide [DMeSe] and dimethyldiselenide [DMDS₂].

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

In instances where a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample concentration, the recoveries and the relative percent difference (RPD) values are not considered valid indicators of data quality. In such instances, the recoveries of the laboratory fortified blank (BS) demonstrates the accuracy of the applied methods. When the spiking level was less than 25% of the native sample concentration, the spike recovery was not reported (**NR**) and the relative percent difference (RPD) of the MS/MSD set was not calculated (**N/C**).

Except for concentration qualifiers, all data were reported without qualification. All associated quality control sample results met the acceptance criteria.

BAL, an accredited laboratory, certifies that the reported results of all analyses for which BAL is NELAP accredited meet all NELAP requirements. For more information, please see the *Report Information* page.

Please feel free to contact us if you have any questions regarding this report.

Sincerely,

A handwritten signature in black ink, appearing to read 'Jeremy Maute', with a stylized flourish at the end.

Jeremy Maute
Senior Project Manager
Jeremy@brooksapplied.com

Report Information

Laboratory Accreditation

BAL is accredited by the *National Environmental Laboratory Accreditation Program* (NELAP) through the State of Florida Department of Health, Bureau of Laboratories (E87982) and is certified to perform many environmental analyses. BAL is also certified by many other states to perform environmental analyses. For a current list of our accreditations/certifications, please visit our website at <<http://www.brooksapplied.com/resources/certificates-permits/>> or review Tables 1 and 2 in our Accreditation Information. Results reported relate only to the samples listed in the report.

Field Quality Control Samples

Please be notified that certain EPA methods require the collection of field quality control samples of an appropriate type and frequency; failure to do so is considered a deviation from some methods and for compliance purposes should only be done with the approval of regulatory authorities. Please see the specific EPA methods for details regarding required field quality control samples.

Common Abbreviations

AR	as received	MS	matrix spike
BAL	Brooks Applied Labs	MSD	matrix spike duplicate
BLK	method blank	ND	non-detect
BS	blank spike	NR	non-reportable
CAL	calibration standard	N/C	not calculated
CCB	continuing calibration blank	PS	post preparation spike
CCV	continuing calibration verification	REC	percent recovery
COC	chain of custody record	RPD	relative percent difference
D	dissolved fraction	SCV	secondary calibration verification
DUP	duplicate	SOP	standard operating procedure
IBL	instrument blank	SRM	reference material
ICV	initial calibration verification	T	total fraction
MDL	method detection limit	TR	total recoverable fraction
MRL	method reporting limit		

Definition of Data Qualifiers

(Effective 3/23/2020)

E	An estimated value due to the presence of interferences. A full explanation is presented in the narrative.
H	Holding time and/or preservation requirements not met. Please see narrative for explanation.
J	Detected by the instrument, the result is > the MDL but ≤ the MRL. Result is reported and considered an estimate.
J-1	Estimated value. A full explanation is presented in the narrative.
M	Duplicate precision (RPD) was not within acceptance criteria. Please see narrative for explanation.
N	Spike recovery was not within acceptance criteria. Please see narrative for explanation.
R	Rejected, unusable value. A full explanation is presented in the narrative.
U	Result is ≤ the MDL or client requested reporting limit (CRRL). Result reported as the MDL or CRRL.
X	Result is not BLK-corrected and is within 10x the absolute value of the highest detectable BLK in the batch. Result is estimated.
Z	Holding time and/or preservation requirements not established for this method; however, BAL recommendations for holding time were not followed. Please see narrative for explanation.

These qualifiers are based on those previously utilized by Brooks Applied Labs, those found in the EPA SOW ILM03.0, Exhibit B, Section III, pg. B-18, and the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review; USEPA; January 2010. These supersede all previous qualifiers ever employed by BAL.

Re: Regional Effects Program

Dear Mike Pope,

On May 19, 2022, Brooks Applied Labs (BAL) received ten (10) aqueous samples. The samples were logged-in for total recoverable selenium [Se], dissolved Se [Se], and Se speciation analyses, according to the chain-of-custody (COC) form.

The **Date Collected** value listed on the chain-of-custody (COC) form did not match the corresponding **Date Collected** value listed on container label for 2205249-04. The discrepancy is described in the table below.

Laboratory ID	Sample ID	Date Collected (on COC form)	Date Collected (on container label)
2205249-04	RG_ERCKUT_WS_LAEMP_EVO_2022-05_NP	5/12/2022 10:00	5/11/2022 10:00

2205249-04 was logged in using the **Date Collected** value listed on the COC form (*column 3 in the table above*).

The sample fractions for total recoverable Se and dissolved Se were not preserved in the field. The samples were preserved (pH < 2) upon receipt at BAL. All sample fractions for total recoverable Se and dissolved Se were preserved within the (14 calendar day) preservation holding time.

The sample fractions logged in for Se speciation and dissolved Se had been field-filtered prior to receipt at BAL. All samples were stored according to BAL SOPs.

Total Recoverable Se and Dissolved Se

Each aqueous sample fraction for dissolved Se was digested in a closed vessel (bomb) with nitric and hydrochloric acids. The resulting digests were analyzed for Se content via inductively coupled plasma triple quadrupole mass spectrometry (ICP-QQQ-MS). The ICP-QQQ-MS instrumentation uses advanced interference removal techniques to ensure accuracy of the sample results. For more information, please visit the *Interference Reduction Technology* section on our website, brooksapplied.com.

Selenium Speciation

Each aqueous sample was analyzed for selenium speciation using ion chromatography inductively coupled plasma collision reaction cell mass spectrometry (IC-ICP-CRC-MS). Selenium species are chromatographically separated on an ion exchange column and then quantified using inductively coupled plasma collision reaction cell mass spectrometry (ICP-CRC-MS); for more information on this determinative

technique, please visit the *Interference Reduction Technology* section on our website. The chromatographic method applied for the analyses provides greater retention of methylseleninic acid and selenomethionine, allowing for more definitive quantitation of these species.

In accordance with the quotation issued for this project, selenium speciation was defined as dissolved selenite [Se(IV)], selenate [Se(VI)], selenocyanate [SeCN], methylseleninic acid [MeSe(IV)], methaneselenonic acid [MeSe(VI)], selenomethionine [SeMet], selenosulfate [SeSO₃], and dimethylselenoxide [DMSeO]. Unknown Se species was defined as the total concentration of all unknown Se species observed during the analysis. This item is identified on the report as [Unk Se Sp].

DMSeO elutes early in the chromatographic run due to the nature of the molecule and the applied chromatographic separation method. Since this species elutes near the dead volume, additional selenium species may coelute. Alternate methods can be applied, upon client request, to increase the separation of DMSeO from potentially co-eluting selenium species.

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

In instances where a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample concentration, the recoveries and the relative percent difference (RPD) are not considered valid indicators of data quality. In such instances, the recoveries of the laboratory fortified blanks (BS) and/or standard reference materials (SRM) demonstrate the accuracy of the applied methods. When the spiking level was less than 25% of the native sample concentration, the spike recovery was not reported (**NR**) and the relative percent difference (RPD) of the MS/MSD set was not calculated (**N/C**).

In cases when either the native sample concentration was non-detectable (reported as less than or equal to the MDL) and/or the corresponding DUP result was also non-detectable, the RPD between the two values was not calculated (**N/C**).

Except for concentration qualifiers, all data were reported without qualification. All associated quality control sample results met the acceptance criteria.

BAL, an accredited laboratory, certifies that the reported results of all analyses for which BAL is NELAP accredited meet all NELAP requirements. For more information, please see the *Report Information* page.

Please feel free to contact us if you have any questions regarding this report.

Sincerely,

Jeremy Maute
Senior Project Manager
Jeremy@brooksapplied.com

Report Information

Laboratory Accreditation

BAL is accredited by the *National Environmental Laboratory Accreditation Program* (NELAP) through the State of Florida Department of Health, Bureau of Laboratories (E87982) and is certified to perform many environmental analyses. BAL is also certified by many other states to perform environmental analyses. For a current list of our accreditations/certifications, please visit our website at <http://www.brooksapplied.com/resources/certificates-permits/> or review Tables 1 and 2 in our Accreditation Information. Results reported relate only to the samples listed in the report.

Field Quality Control Samples

Please be notified that certain EPA methods require the collection of field quality control samples of an appropriate type and frequency; failure to do so is considered a deviation from some methods and for compliance purposes should only be done with the approval of regulatory authorities. Please see the specific EPA methods for details regarding required field quality control samples.

Common Abbreviations

AR	as received	MS	matrix spike
BAL	Brooks Applied Labs	MSD	matrix spike duplicate
BLK	method blank	ND	non-detect
BS	blank spike	NR	non-reportable
CAL	calibration standard	N/C	not calculated
CCB	continuing calibration blank	PS	post preparation spike
CCV	continuing calibration verification	REC	percent recovery
COC	chain of custody record	RPD	relative percent difference
D	dissolved fraction	SCV	secondary calibration verification
DUP	duplicate	SOP	standard operating procedure
IBL	instrument blank	SRM	reference material
ICV	initial calibration verification	T	total fraction
MDL	method detection limit	TR	total recoverable fraction
MRL	method reporting limit		

Definition of Data Qualifiers

(Effective 3/23/2020)

E	An estimated value due to the presence of interferences. A full explanation is presented in the narrative.
H	Holding time and/or preservation requirements not met. Please see narrative for explanation.
J	Detected by the instrument, the result is > the MDL but ≤ the MRL. Result is reported and considered an estimate.
J-1	Estimated value. A full explanation is presented in the narrative.
M	Duplicate precision (RPD) was not within acceptance criteria. Please see narrative for explanation.
N	Spike recovery was not within acceptance criteria. Please see narrative for explanation.
R	Rejected, unusable value. A full explanation is presented in the narrative.
U	Result is ≤ the MDL or client requested reporting limit (CRRL). Result reported as the MDL or CRRL.
X	Result is not BLK-corrected and is within 10x the absolute value of the highest detectable BLK in the batch. Result is estimated.
Z	Holding time and/or preservation requirements not established for this method; however, BAL recommendations for holding time were not followed. Please see narrative for explanation.

These qualifiers are based on those previously utilized by Brooks Applied Labs, those found in the EPA SOW ILM03.0, Exhibit B, Section III, pg. B-18, and the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review; USEPA; January 2010. These supersede all previous qualifiers ever employed by BAL.

Re: Regional Effects Program

Dear Mike Pope,

On June 2, 2022, Brooks Applied Labs (BAL) received eight (8) aqueous samples. The samples were logged-in for total recoverable selenium [Se], dissolved Se [Se], and Se speciation analyses, according to the chain-of-custody (COC) form.

The **Date/Time Collected** value listed on the chain-of-custody (COC) form did not match the corresponding **Date/Time Collected** values listed on container labels for 2206045-05 and 2206045-06. The discrepancies are described in the table below.

Date/Time Collected Discrepancies

Laboratory ID	Sample ID	Date/Time Collected (on COC form)	Date/Time Collected (on container label)
2206045-05	RG_ERCKDT_WS_LAEMP_EVO_2022-05-20_NP_NAL	05/19/2022 08:30	05/19/2022 08:45
2206045-06	RG_ERCKDT_WS_LAEMP_EVO_2022-05-20_NP_NAL	05/19/2022 08:30	05/19/2022 08:45

2206045-05 and 2206045-06 were logged in using the **Date/Time Collected** value listed on the COC form (*column 3 in the table above*).

The sample fractions for total recoverable Se and dissolved Se were not preserved in the field. The samples were preserved (pH < 2) upon receipt at BAL. All sample fractions for total recoverable Se and dissolved Se were preserved within the (14 calendar day) preservation holding time.

The sample fractions logged in for Se speciation and dissolved Se had been field-filtered prior to receipt at BAL. All samples were stored according to BAL SOPs.

Total Recoverable Se and Dissolved Se

Each aqueous sample fraction for dissolved Se was digested in a closed vessel (bomb) with nitric and hydrochloric acids. The resulting digests were analyzed for Se content via inductively coupled plasma triple quadrupole mass spectrometry (ICP-QQQ-MS). The ICP-QQQ-MS instrumentation uses advanced interference removal techniques to ensure accuracy of the sample results. For more information, please visit the *Interference Reduction Technology* section on our website, brooksapplied.com.

Selenium Speciation

Each aqueous sample was analyzed for selenium speciation using ion chromatography inductively coupled plasma collision reaction cell mass spectrometry (IC-ICP-CRC-MS). Selenium species are chromatographically separated on an ion exchange column and then quantified using inductively coupled plasma collision reaction cell mass spectrometry (ICP-CRC-MS); for more information on this determinative technique, please visit the *Interference Reduction Technology* section on our website. The chromatographic method applied for the analyses provides greater retention of methylseleninic acid and selenomethionine, allowing for more definitive quantitation of these species.

In accordance with the quotation issued for this project, selenium speciation was defined as dissolved selenite [Se(IV)], selenate [Se(VI)], selenocyanate [SeCN], methylseleninic acid [MeSe(IV)], methaneselenonic acid [MeSe(VI)], selenomethionine [SeMet], selenosulfate [SeSO₃], and dimethylselenoxide [DMSeO]. Unknown Se species was defined as the total concentration of all unknown Se species observed during the analysis. This item is identified on the report as [Unk Se Sp].

DMSeO elutes early in the chromatographic run due to the nature of the molecule and the applied chromatographic separation method. Since this species elutes near the dead volume, additional selenium species may coelute. Alternate methods can be applied, upon client request, to increase the separation of DMSeO from potentially co-eluting selenium species.

Chromatographic interference, as indicated by an elevated baseline, or co-eluting peak, was observed for selenosulfate in sample 2206045-04. Due to potential bias, the affected result has been qualified as estimated (**J-1**). Upon client request, Brooks Applied Labs can apply a higher dilution to this sample to potentially mitigate the chromatographic interferences, but a higher dilution would elevate the detection limit for SeMet above the client's requested limit of 0.010µg/L.

Poor mass balance was observed in *RG_ERCKUT_WS_LAEMP_EVO_2022-05-20_NP* when the Se speciation results (2206045-01) were compared to corresponding dissolved Se result (2206045-02). Container labels were checked and there was no indication of samples mis-labeled. Re-analyses confirmed the original results for 2206045-01. Consequently, no additional corrective actions are necessary. Results for these samples are reported from initial injections, and the reported results are deemed representative of the submitted containers.

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

In instances where a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample concentration, the recoveries and the relative percent difference (RPD) are not considered valid indicators of data quality. In such instances, the recoveries of the laboratory fortified blanks (BS) and/or standard reference materials (SRM) demonstrate the accuracy of the applied methods. When the spiking level was less than 25% of the native sample concentration, the spike recovery was not reported (**NR**) and the relative percent difference (RPD) of the MS/MSD set was not calculated (**N/C**).

In cases when either the native sample concentration was non-detectable (reported as less than or equal to the MDL) and/or the corresponding DUP result was also non-detectable, the RPD between the two values was not calculated (**N/C**).

Except for concentration qualifiers and the item noted above, all data were reported without qualification. All associated quality control sample results met the acceptance criteria.

BAL, an accredited laboratory, certifies that the reported results of all analyses for which BAL is NELAP accredited meet all NELAP requirements. For more information, please see the *Report Information* page.

Please feel free to contact us if you have any questions regarding this report.

Sincerely,

A handwritten signature in black ink, appearing to read 'Jeremy Maute', with a stylized flourish at the end.

Jeremy Maute
Senior Project Manager

Report Information

Laboratory Accreditation

BAL is accredited by the *National Environmental Laboratory Accreditation Program* (NELAP) through the State of Florida Department of Health, Bureau of Laboratories (E87982) and is certified to perform many environmental analyses. BAL is also certified by many other states to perform environmental analyses. For a current list of our accreditations/certifications, please visit our website at <http://www.brooksapplied.com/resources/certificates-permits/> or review Tables 1 and 2 in our Accreditation Information. Results reported relate only to the samples listed in the report.

Field Quality Control Samples

Please be notified that certain EPA methods require the collection of field quality control samples of an appropriate type and frequency; failure to do so is considered a deviation from some methods and for compliance purposes should only be done with the approval of regulatory authorities. Please see the specific EPA methods for details regarding required field quality control samples.

Common Abbreviations

AR	as received	MS	matrix spike
BAL	Brooks Applied Labs	MSD	matrix spike duplicate
BLK	method blank	ND	non-detect
BS	blank spike	NR	non-reportable
CAL	calibration standard	N/C	not calculated
CCB	continuing calibration blank	PS	post preparation spike

DUP	duplicate	SOP	standard operating procedure
IBL	instrument blank	SRM	reference material
ICV	initial calibration verification	T	total fraction
MDL	method detection limit	TR	total recoverable fraction
MRL	method reporting limit		

Definition of Data Qualifiers

(Effective 3/23/2020)

E	An estimated value due to the presence of interferences. A full explanation is presented in the narrative.
H	Holding time and/or preservation requirements not met. Please see narrative for explanation.
J	Detected by the instrument, the result is > the MDL but ≤ the MRL. Result is reported and considered an estimate.
J-1	Estimated value. A full explanation is presented in the narrative.
M	Duplicate precision (RPD) was not within acceptance criteria. Please see narrative for explanation.
N	Spike recovery was not within acceptance criteria. Please see narrative for explanation.
R	Rejected, unusable value. A full explanation is presented in the narrative.
U	Result is ≤ the MDL or client requested reporting limit (CRRL). Result reported as the MDL or CRRL.
X	Result is not BLK-corrected and is within 10x the absolute value of the highest detectable BLK in the batch. Result is estimated.
Z	Holding time and/or preservation requirements not established for this method; however, BAL recommendations for holding time were not followed. Please see narrative for explanation.

These qualifiers are based on those previously utilized by Brooks Applied Labs, those found in the EPA SOW ILM03.0, Exhibit B, Section III, pg. B-18, and the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review; USEPA; January 2010. These supersede all previous qualifiers ever employed by BAL.

Re: Regional Effects Program

Dear Mike Pope,

On June 2, 2022, Brooks Applied Labs (BAL) received four (4) aqueous samples. The samples were logged-in for volatile selenium (Se) speciation analyses, in accordance with the chain-of-custody (COC) form.

The **Date/Time Collected** value listed on the chain-of-custody (COC) form did not match the corresponding **Date/Time Collected** value listed on container label for 2206048-01. The discrepancy is described in the table below.

Date/Time Collected Discrepancies

Laboratory ID	Sample ID	Date/Time Collected (on COC form)	Date/Time Collected (on container label)
2206048-01	RG_ERCKDT_WS_LAEMP_EVO_2022-05-19_NP	05/19/2022 08:30	05/19/2022 08:40

2206048-01 was logged in and reported using the **Date/Time Collected** value listed on the COC form (*column 3 in the table above*).

Each sample requesting volatile Se speciation had been field-filtered into bottles containing isopropanol preservative (provided by BAL). All sample fractions were stored according to BAL SOPs and EPA methodology.

Volatile Selenium Speciation

Each aqueous sample was analyzed for volatile selenium speciation using high performance liquid chromatography inductively coupled plasma collision reaction cell mass spectrometry (HPLC-ICP-CRC-MS). Volatile selenium species are chromatographically separated on a reversed phase column and then quantified using inductively coupled plasma collision reaction cell mass spectrometry (ICP-CRC-MS); for more information on this determinative technique, please visit the *Interference Reduction Technology* section on our website.

In accordance with the quotation issued for this project, volatile selenium species were defined as dissolved dimethylselenide [DMeSe] and dimethyldiselenide [DMDS₂].

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

In instances where a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample concentration, the recoveries and the relative percent difference (RPD) values are not considered valid indicators of data quality. In such instances, the recoveries of the laboratory fortified blank (BS) demonstrates the accuracy of the applied methods. When the spiking level was less than 25% of the native sample concentration, the spike recovery was not reported (**NR**) and the relative percent difference (RPD) of the MS/MSD set was not calculated (**N/C**).

Except for concentration qualifiers, all data were reported without qualification. All associated quality control sample results met the acceptance criteria.

BAL, an accredited laboratory, certifies that the reported results of all analyses for which BAL is NELAP accredited meet all NELAP requirements. For more information, please see the *Report Information* page.

Please feel free to contact us if you have any questions regarding this report.

Sincerely,

Jeremy Maute

Senior Project Manager

Jeremy@brooksapplied.com

Report Information

Laboratory Accreditation

BAL is accredited by the *National Environmental Laboratory Accreditation Program* (NELAP) through the State of Florida Department of Health, Bureau of Laboratories (E87982) and is certified to perform many environmental analyses. BAL is also certified by many other states to perform environmental analyses. For a current list of our accreditations/certifications, please visit our website at <http://www.brooksapplied.com/resources/certificates-permits/> or review Tables 1 and 2 in our Accreditation Information. Results reported relate only to the samples listed in the report.

Field Quality Control Samples

Please be notified that certain EPA methods require the collection of field quality control samples of an appropriate type and frequency; failure to do so is considered a deviation from some methods and for compliance purposes should only be done with the approval of regulatory authorities. Please see the specific EPA methods for details regarding required field quality control samples.

Common Abbreviations

AR	as received	MS	matrix spike
BAL	Brooks Applied Labs	MSD	matrix spike duplicate
BLK	method blank	ND	non-detect
BS	blank spike	NR	non-reportable
CAL	calibration standard	N/C	not calculated
CCB	continuing calibration blank	PS	post preparation spike
CCV	continuing calibration verification	REC	percent recovery
COC	chain of custody record	RPD	relative percent difference
D	dissolved fraction	SCV	secondary calibration verification
DUP	duplicate	SOP	standard operating procedure
IBL	instrument blank	SRM	reference material
ICV	initial calibration verification	T	total fraction
MDL	method detection limit	TR	total recoverable fraction
MRL	method reporting limit		

Definition of Data Qualifiers

(Effective 3/23/2020)

E	An estimated value due to the presence of interferences. A full explanation is presented in the narrative.
H	Holding time and/or preservation requirements not met. Please see narrative for explanation.
J	Detected by the instrument, the result is > the MDL but ≤ the MRL. Result is reported and considered an estimate.
J-1	Estimated value. A full explanation is presented in the narrative.
M	Duplicate precision (RPD) was not within acceptance criteria. Please see narrative for explanation.
N	Spike recovery was not within acceptance criteria. Please see narrative for explanation.
R	Rejected, unusable value. A full explanation is presented in the narrative.
U	Result is ≤ the MDL or client requested reporting limit (CRRL). Result reported as the MDL or CRRL.
X	Result is not BLK-corrected and is within 10x the absolute value of the highest detectable BLK in the batch. Result is estimated.
Z	Holding time and/or preservation requirements not established for this method; however, BAL recommendations for holding time were not followed. Please see narrative for explanation.

These qualifiers are based on those previously utilized by Brooks Applied Labs, those found in the EPA SOW ILM03.0, Exhibit B, Section III, pg. B-18, and the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review; USEPA; January 2010. These supersede all previous qualifiers ever employed by BAL.

Re: Regional Effects Program

Dear Mike Pope,

On June 9, 2022, Brooks Applied Labs (BAL) received ten (10) aqueous samples. The samples were logged-in for total recoverable selenium [Se], dissolved Se [Se], and Se speciation analyses, according to the chain-of-custody (COC) form.

Date/Time Collected values listed on the chain-of-custody (COC) form did not match the corresponding **Date/Time Collected** values listed on container labels for several samples. The discrepancies are described in the table below.

Date/Time Collected Discrepancies

Laboratory ID	Sample ID	Date/Time Collected (on COC form)	Date/Time Collected (on container label)
2206145-04	RG_BOCKRD_WS_LAEMP_EVO_2022-06-03_NP	06/02/2022 08:56	06/03/2022 08:56
2206145-05	RG_BOCKRD_WS_LAEMP_EVO_2022-06-03_NP_NAL	06/02/2022 08:56	06/03/2022 08:56

2206145-12	RG_ALUSM_WS_LAEMP_EVO_2022-06-03_NP_NAL	06/02/2022 12:40	06/03/2022 12:40
2206145-13	RG_MI25_WS_LAEMP_EVO_2022-06-03_NP	06/02/2022 14:43	06/03/2022 14:43

Samples described in the table above were logged in and reported using the **Date/Time Collected** values listed on the COC form (*column 3 in the table above*).

The sample fractions for total recoverable Se and dissolved Se were not preserved in the field. The samples were preserved (pH < 2) upon receipt at BAL. All sample fractions for total recoverable Se and dissolved Se were preserved within the (14 calendar day) preservation holding time.

The sample fractions logged in for Se speciation and dissolved Se had been field-filtered prior to receipt at BAL. All samples were stored according to BAL SOPs.

Total Recoverable Se and Dissolved Se

Each aqueous sample fraction for dissolved Se was digested in a closed vessel (bomb) with nitric and hydrochloric acids. The resulting digests were analyzed for Se content via inductively coupled plasma triple quadrupole mass spectrometry (ICP-QQQ-MS). The ICP-QQQ-MS instrumentation uses advanced interference removal techniques to ensure accuracy of the sample results. For more information, please visit the *Interference Reduction Technology* section on our website, brooksupplied.com.

Selenium Speciation

Each aqueous sample was analyzed for selenium speciation using ion chromatography inductively coupled plasma collision reaction cell mass spectrometry (IC-ICP-CRC-MS). Selenium species are chromatographically separated on an ion exchange column and then quantified using inductively coupled plasma collision reaction cell mass spectrometry (ICP-CRC-MS); for more information on this determinative technique, please visit the *Interference Reduction Technology* section on our website. The chromatographic method applied for the analyses provides greater retention of methylseleninic acid and selenomethionine, allowing for more definitive quantitation of these species.

In accordance with the quotation issued for this project, selenium speciation was defined as dissolved selenite [Se(IV)], selenate [Se(VI)], selenocyanate [SeCN], methylseleninic acid [MeSe(IV)], methaneselenonic acid [MeSe(VI)], selenomethionine [SeMef], selenosulfate [SeSO₃], and dimethylselenoxide [DMSeO]. Unknown Se species was defined as the total concentration of all unknown Se species observed during the analysis. This item is identified on the report as [Unk Se Sp].

DMSeO elutes early in the chromatographic run due to the nature of the molecule and the applied chromatographic separation method. Since this species elutes near the dead volume, additional selenium species may coelute. Alternate methods can be applied, upon client request, to increase the separation of DMSeO from potentially co-eluting selenium species.

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

In instances where a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample concentration, the recoveries and the relative percent difference (RPD) are not considered valid indicators of data quality. In such instances, the recoveries of the laboratory fortified blanks (BS) and/or standard reference materials (SRM) demonstrate the accuracy of the applied methods. When the spiking

level was less than 25% of the native sample concentration, the spike recovery was not reported (**NR**) and the relative percent difference (RPD) of the MS/MSD set was not calculated (**N/C**).

In cases when either the native sample concentration was non-detectable (reported as less than or equal to the MDL) and/or the corresponding DUP result was also non-detectable, the RPD between the two values was not calculated (**N/C**).

Except for concentration qualifiers, all data were reported without qualification. All associated quality control sample results met the acceptance criteria.

BAL, an accredited laboratory, certifies that the reported results of all analyses for which BAL is NELAP accredited meet all NELAP requirements. For more information, please see the *Report Information* page.

Please feel free to contact us if you have any questions regarding this report.

Sincerely,

Jeremy Maute
Senior Project Manager

Jeremy@brooksapplied.com

Report Information

Laboratory Accreditation

BAL is accredited by the *National Environmental Laboratory Accreditation Program* (NELAP) through the State of Florida Department of Health, Bureau of Laboratories (E87982) and is certified to perform many environmental analyses. BAL is also certified by many other states to perform environmental analyses. For a current list of our accreditations/certifications, please visit our website at <http://www.brooksapplied.com/resources/certificates-permits/> or review Tables 1 and 2 in our Accreditation Information. Results reported relate only to the samples listed in the report.

Field Quality Control Samples

Please be notified that certain EPA methods require the collection of field quality control samples of an appropriate type and frequency; failure to do so is considered a deviation from some methods and for compliance purposes should only be done with the approval of regulatory authorities. Please see the specific EPA methods for details regarding required field quality control samples.

Common Abbreviations

AR	as received	MS	matrix spike
BAL	Brooks Applied Labs	MSD	matrix spike duplicate
BLK	method blank	ND	non-detect
BS	blank spike	NR	non-reportable
CAL	calibration standard	N/C	not calculated
CCB	continuing calibration blank	PS	post preparation spike
CCV	continuing calibration verification	REC	percent recovery
COC	chain of custody record	RPD	relative percent difference
D	dissolved fraction	SCV	secondary calibration verification
DUP	duplicate	SOP	standard operating procedure
IBL	instrument blank	SRM	reference material
ICV	initial calibration verification	T	total fraction
MDL	method detection limit	TR	total recoverable fraction
MRL	method reporting limit		

Definition of Data Qualifiers

(Effective 3/23/2020)

E	An estimated value due to the presence of interferences. A full explanation is presented in the narrative.
H	Holding time and/or preservation requirements not met. Please see narrative for explanation.
J	Detected by the instrument, the result is > the MDL but ≤ the MRL. Result is reported and considered an estimate.
J-1	Estimated value. A full explanation is presented in the narrative.
M	Duplicate precision (RPD) was not within acceptance criteria. Please see narrative for explanation.
N	Spike recovery was not within acceptance criteria. Please see narrative for explanation.
R	Rejected, unusable value. A full explanation is presented in the narrative.
U	Result is ≤ the MDL or client requested reporting limit (CRRL). Result reported as the MDL or CRRL.
X	Result is not BLK-corrected and is within 10x the absolute value of the highest detectable BLK in the batch. Result is estimated.
Z	Holding time and/or preservation requirements not established for this method; however, BAL recommendations for holding time were not followed. Please see narrative for explanation.

These qualifiers are based on those previously utilized by Brooks Applied Labs, those found in the EPA SOW ILM03.0, Exhibit B, Section III, pg. B-18, and the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review; USEPA; January 2010. These supersede all previous qualifiers ever employed by BAL.

Revision 1

Following the submission of the original report on June 27, 2022, it was determined that **Sample ID** and **Sample Location (sys_loc_code)** values included in the original report were incorrect for several samples. Specifically, for samples 2206149-31, 2206149-32, and 2206149-33, an "RG_M13" term was used for reporting in the initial report. In this revised report, an "RG_M13" term was used for the **Sample ID** and **Sample Location (sys_loc_code)** values instead, in accordance with the COC forms. No other changes were made, with respect to the original report issued on June 27, 2022.

Re: Regional Effects Program

Dear Mike Pope,

On June 9, 2022, Brooks Applied Labs (BAL) received thirty (30) aqueous samples. The samples were logged-in for total recoverable selenium [Se], dissolved Se [Se], and Se speciation analyses, according to the chain-of-custody (COC) form.

The sample fractions for total recoverable Se and dissolved Se were not preserved in the field. The samples were preserved (pH < 2) upon receipt at BAL. All sample fractions for total recoverable Se and dissolved Se were preserved within the (14 calendar day) preservation holding time.

The sample fractions logged in for Se speciation and dissolved Se had been field-filtered prior to receipt at BAL. All samples were stored according to BAL SOPs.

Total Recoverable Se and Dissolved Se

Each aqueous sample fraction for dissolved Se was digested in a closed vessel (bomb) with nitric and hydrochloric acids. The resulting digests were analyzed for Se content via inductively coupled plasma triple quadrupole mass spectrometry (ICP-QQQ-MS). The ICP-QQQ-MS instrumentation uses advanced interference removal techniques to ensure accuracy of the sample results. For more information, please visit the *Interference Reduction Technology* section on our website, brooksapplied.com.

Selenium Speciation

Each aqueous sample was analyzed for selenium speciation using ion chromatography inductively coupled plasma collision reaction cell mass spectrometry (IC-ICP-CRC-MS). Selenium species are chromatographically separated on an ion exchange column and then quantified using inductively coupled plasma collision reaction cell mass spectrometry (ICP-CRC-MS); for more information on this determinative technique, please visit the *Interference Reduction Technology* section on our website. The chromatographic

method applied for the analyses provides greater retention of methylseleninic acid and selenomethionine, allowing for more definitive quantitation of these species.

In accordance with the quotation issued for this project, selenium speciation was defined as dissolved selenite [Se(IV)], selenate [Se(VI)], selenocyanate [SeCN], methylseleninic acid [MeSe(IV)], methaneselenonic acid [MeSe(VI)], selenomethionine [SeMet], selenosulfate [SeSO₃], and dimethylselenoxide [DMSeO]. Unknown Se species was defined as the total concentration of all unknown Se species observed during the analysis. This item is identified on the report as [Unk Se Sp].

DMSeO elutes early in the chromatographic run due to the nature of the molecule and the applied chromatographic separation method. Since this species elutes near the dead volume, additional selenium species may coelute. Alternate methods can be applied, upon client request, to increase the separation of DMSeO from potentially co-eluting selenium species.

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

In instances where a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample concentration, the recoveries and the relative percent difference (RPD) are not considered valid indicators of data quality. In such instances, the recoveries of the laboratory fortified blanks (BS) and/or standard reference materials (SRM) demonstrate the accuracy of the applied methods. When the spiking level was less than 25% of the native sample concentration, the spike recovery was not reported (**NR**) and the relative percent difference (RPD) of the MS/MSD set was not calculated (**N/C**).

In cases when either the native sample concentration was non-detectable (reported as less than or equal to the MDL) and/or the corresponding DUP result was also non-detectable, the RPD between the two values was not calculated (**N/C**).

Except for concentration qualifiers, all data were reported without qualification. All associated quality control sample results met the acceptance criteria.

BAL, an accredited laboratory, certifies that the reported results of all analyses for which BAL is NELAP accredited meet all NELAP requirements. For more information, please see the *Report Information* page.

Please feel free to contact us if you have any questions regarding this report.

Sincerely,

Jeremy Maute

Senior Project Manager

Jeremy@brooksapplied.com

Report Information

Laboratory Accreditation

BAL is accredited by the *National Environmental Laboratory Accreditation Program* (NELAP) through the State of Florida Department of Health, Bureau of Laboratories (E87982) and is certified to perform many environmental analyses. BAL is also certified by many other states to perform environmental analyses. For a current list of our accreditations/certifications, please visit our website at <http://www.brooksapplied.com/resources/certificates-permits/> or review Tables 1 and 2 in our Accreditation Information. Results reported relate only to the samples listed in the report.

Field Quality Control Samples

Please be notified that certain EPA methods require the collection of field quality control samples of an appropriate type and frequency; failure to do so is considered a deviation from some methods and for compliance purposes should only be done with the approval of regulatory authorities. Please see the specific EPA methods for details regarding required field quality control samples.

Common Abbreviations

AR	as received	MS	matrix spike
BAL	Brooks Applied Labs	MSD	matrix spike duplicate
BLK	method blank	ND	non-detect
BS	blank spike	NR	non-reportable
CAL	calibration standard	N/C	not calculated
CCB	continuing calibration blank	PS	post preparation spike
CCV	continuing calibration verification	REC	percent recovery
COC	chain of custody record	RPD	relative percent difference
D	dissolved fraction	SCV	secondary calibration verification
DUP	duplicate	SOP	standard operating procedure
IBL	instrument blank	SRM	reference material
ICV	initial calibration verification	T	total fraction
MDL	method detection limit	TR	total recoverable fraction
MRL	method reporting limit		

Definition of Data Qualifiers

(Effective 3/23/2020)

E	An estimated value due to the presence of interferences. A full explanation is presented in the narrative.
H	Holding time and/or preservation requirements not met. Please see narrative for explanation.
J	Detected by the instrument, the result is > the MDL but ≤ the MRL. Result is reported and considered an estimate.
J-1	Estimated value. A full explanation is presented in the narrative.
M	Duplicate precision (RPD) was not within acceptance criteria. Please see narrative for explanation.
N	Spike recovery was not within acceptance criteria. Please see narrative for explanation.
R	Rejected, unusable value. A full explanation is presented in the narrative.
U	Result is ≤ the MDL or client requested reporting limit (CRRL). Result reported as the MDL or CRRL.
X	Result is not BLK-corrected and is within 10x the absolute value of the highest detectable BLK in the batch. Result is estimated.
Z	Holding time and/or preservation requirements not established for this method; however, BAL recommendations for holding time were not followed. Please see narrative for explanation.

These qualifiers are based on those previously utilized by Brooks Applied Labs, those found in the EPA SOW ILM03.0, Exhibit B, Section III, pg. B-18, and the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review; USEPA; January 2010. These supersede all previous qualifiers ever employed by BAL.

<small>NOTICE OF CLAIM: (a) No Carrier is liable for loss, damage or delay of any goods under the Bill of Lading unless notice, therefore setting out particulars of the origin, destination and date of shipment of the goods and the estimated amount claimed in respect of such loss, damage or delay is given in writing to the originating carrier or the delivering carrier within nine (9) days after the delivery of the goods, or in the case of failure to make delivery within nine (9) months from the date of shipment. (b) The final statement of the claim must be filed within nine (9) months from the date of shipment together with a copy of the paid freight bill. RECEIVED at the point of origin on the date specified from the consignor mentioned herein, the property herein described, in apparent good order, except as noted (contents and condition of contents of package unknown) marked, consigned and delivered as indicated below, which the carrier agrees to carry and to deliver to the consignee at the said destination, subject to the rates and classification in effect on the date of shipment. It is mutually agreed, as to each carrier of all or any of the goods over all or any portion of the route to destination, and as to each carrier of any time interested in all or any of the goods, that every service to be performed hereunder shall be subject to the conditions standard Bill of Lading, in power at the date of issuing, which are hereto agreed by the consignor and accepted for himself and his assigns. Printed or written, including conditions set aside by the standard Bill of Lading, in power at the date of issuing, which are hereby agreed by the consignor and accepted for himself and his assigns. The Contract for the carriage of the goods listed in the Bill of Lading is governed by regulation in force in the jurisdiction at the time and place of shipment and is subject to the conditions set out in such conditions.</small>

Re: Elkview Operations

Dear Mike Pope,

On June 9, 2022, Brooks Applied Labs (BAL) received three (3) aqueous samples. The samples were logged-in for total recoverable selenium [Se], dissolved Se [Se], and Se speciation analyses, according to the chain-of-custody (COC) form.

The sample fractions for total recoverable Se and dissolved Se were not preserved in the field. The samples were preserved (pH < 2) upon receipt at BAL. All sample fractions for total recoverable Se and dissolved Se were preserved within the (14 calendar day) preservation holding time.

The sample fractions logged in for Se speciation and dissolved Se had been field-filtered prior to receipt at BAL. All samples were stored according to BAL SOPs.

Total Recoverable Se and Dissolved Se

Each aqueous sample fraction for dissolved Se was digested in a closed vessel (bomb) with nitric and hydrochloric acids. The resulting digests were analyzed for Se content via inductively coupled plasma triple quadrupole mass spectrometry (ICP-QQQ-MS). The ICP-QQQ-MS instrumentation uses advanced interference removal techniques to ensure accuracy of the sample results. For more information, please visit the *Interference Reduction Technology* section on our website, brooksapplied.com.

Selenium Speciation

Each aqueous sample was analyzed for selenium speciation using ion chromatography inductively coupled plasma collision reaction cell mass spectrometry (IC-ICP-CRC-MS). Selenium species are chromatographically separated on an ion exchange column and then quantified using inductively coupled plasma collision reaction cell mass spectrometry (ICP-CRC-MS); for more information on this determinative technique, please visit the *Interference Reduction Technology* section on our website. The chromatographic method applied for the analyses provides greater retention of methylseleninic acid and selenomethionine, allowing for more definitive quantitation of these species.

In accordance with the quotation issued for this project, selenium speciation was defined as dissolved selenite [Se(IV)], selenate [Se(VI)], selenocyanate [SeCN], methylseleninic acid [MeSe(IV)], methaneselenonic acid [MeSe(VI)], selenomethionine [SeMef], selenosulfate [SeSO₃], and dimethylselenoxide [DMSeO]. Unknown Se species was defined as the total concentration of all unknown Se species observed during the analysis. This item is identified on the report as [Unk Se Sp].

DMS₂SeO elutes early in the chromatographic run due to the nature of the molecule and the applied chromatographic separation method. Since this species elutes near the dead volume, additional selenium species may coelute. Alternate methods can be applied, upon client request, to increase the separation of DMS₂SeO from potentially co-eluting selenium species.

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

In instances where a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample concentration, the recoveries and the relative percent difference (RPD) are not considered valid indicators of data quality. In such instances, the recoveries of the laboratory fortified blanks (BS) and/or standard reference materials (SRM) demonstrate the accuracy of the applied methods. When the spiking level was less than 25% of the native sample concentration, the spike recovery was not reported (**NR**) and the relative percent difference (RPD) of the MS/MSD set was not calculated (**N/C**).

In cases when either the native sample concentration was non-detectable (reported as less than or equal to the MDL) and/or the corresponding DUP result was also non-detectable, the RPD between the two values was not calculated (**N/C**).

Except for concentration qualifiers, all data were reported without qualification. All associated quality control sample results met the acceptance criteria.

BAL, an accredited laboratory, certifies that the reported results of all analyses for which BAL is NELAP accredited meet all NELAP requirements. For more information, please see the *Report Information* page.

Please feel free to contact us if you have any questions regarding this report.

Sincerely,

Jeremy Maute

Senior Project Manager

Jeremy@brooksapplied.com

Report Information

Laboratory Accreditation

BAL is accredited by the *National Environmental Laboratory Accreditation Program* (NELAP) through the State of Florida Department of Health, Bureau of Laboratories (E87982) and is certified to perform many environmental analyses. BAL is also certified by many other states to perform environmental analyses. For a current list of our accreditations/certifications, please visit our website at <http://www.brooksapplied.com/resources/certificates-permits/> or review Tables 1 and 2 in our Accreditation Information. Results reported relate only to the samples listed in the report.

Field Quality Control Samples

Please be notified that certain EPA methods require the collection of field quality control samples of an appropriate type and frequency; failure to do so is considered a deviation from some methods and for compliance purposes should only be done with the approval of regulatory authorities. Please see the specific EPA methods for details regarding required field quality control samples.

Common Abbreviations

AR	as received	MS	matrix spike
BAL	Brooks Applied Labs	MSD	matrix spike duplicate
BLK	method blank	ND	non-detect
BS	blank spike	NR	non-reportable
CAL	calibration standard	N/C	not calculated
CCB	continuing calibration blank	PS	post preparation spike
CCV	continuing calibration verification	REC	percent recovery
COC	chain of custody record	RPD	relative percent difference
D	dissolved fraction	SCV	secondary calibration verification
DUP	duplicate	SOP	standard operating procedure
IBL	instrument blank	SRM	reference material
ICV	initial calibration verification	T	total fraction
MDL	method detection limit	TR	total recoverable fraction
MRL	method reporting limit		

Definition of Data Qualifiers

(Effective 3/23/2020)

E	An estimated value due to the presence of interferences. A full explanation is presented in the narrative.
H	Holding time and/or preservation requirements not met. Please see narrative for explanation.
J	Detected by the instrument, the result is > the MDL but ≤ the MRL. Result is reported and considered an estimate.
J-1	Estimated value. A full explanation is presented in the narrative.
M	Duplicate precision (RPD) was not within acceptance criteria. Please see narrative for explanation.
N	Spike recovery was not within acceptance criteria. Please see narrative for explanation.
R	Rejected, unusable value. A full explanation is presented in the narrative.
U	Result is ≤ the MDL or client requested reporting limit (CRRL). Result reported as the MDL or CRRL.
X	Result is not BLK-corrected and is within 10x the absolute value of the highest detectable BLK in the batch. Result is estimated.
Z	Holding time and/or preservation requirements not established for this method; however, BAL recommendations for holding time were not followed. Please see narrative for explanation.

These qualifiers are based on those previously utilized by Brooks Applied Labs, those found in the EPA SOW ILM03.0, Exhibit B, Section III, pg. B-18, and the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review; USEPA; January 2010. These supersede all previous qualifiers ever employed by BAL.

Re: Elkview Operations

Dear Mike Pope,

On July 7, 2022, Brooks Applied Labs (BAL) received two (2) aqueous samples. The samples were logged-in for total recoverable selenium [Se], dissolved Se [Se], and Se speciation analyses, according to the chain-of-custody (COC) form.

The sample fractions for total recoverable Se and dissolved Se were not preserved in the field. The samples were preserved (pH < 2) upon receipt at BAL. All sample fractions for total recoverable Se and dissolved Se were preserved within the (14 calendar day) preservation holding time.

The sample fractions logged in for Se speciation and dissolved Se had been field-filtered prior to receipt at BAL. All samples were stored according to BAL SOPs.

Total Recoverable Se and Dissolved Se

Each aqueous sample fraction for dissolved Se was digested in a closed vessel (bomb) with nitric and hydrochloric acids. The resulting digests were analyzed for Se content via inductively coupled plasma triple quadrupole mass spectrometry (ICP-QQQ-MS). The ICP-QQQ-MS instrumentation uses advanced interference removal techniques to ensure accuracy of the sample results. For more information, please visit the *Interference Reduction Technology* section on our website, brooksapplied.com.

Selenium Speciation

Each aqueous sample was analyzed for selenium speciation using ion chromatography inductively coupled plasma collision reaction cell mass spectrometry (IC-ICP-CRC-MS). Selenium species are chromatographically separated on an ion exchange column and then quantified using inductively coupled plasma collision reaction cell mass spectrometry (ICP-CRC-MS); for more information on this determinative technique, please visit the *Interference Reduction Technology* section on our website. The chromatographic method applied for the analyses provides greater retention of methylseleninic acid and selenomethionine, allowing for more definitive quantitation of these species.

In accordance with the quotation issued for this project, selenium speciation was defined as dissolved selenite [Se(IV)], selenate [Se(VI)], selenocyanate [SeCN], methylseleninic acid [MeSe(IV)], methaneselenonic acid [MeSe(VI)], selenomethionine [SeMef], selenosulfate [SeSO₃], and dimethylselenoxide [DMSeO]. Unknown Se species was defined as the total concentration of all unknown Se species observed during the analysis. This item is identified on the report as [Unk Se Sp].

DMS₂SeO elutes early in the chromatographic run due to the nature of the molecule and the applied chromatographic separation method. Since this species elutes near the dead volume, additional selenium species may coelute. Alternate methods can be applied, upon client request, to increase the separation of DMS₂SeO from potentially co-eluting selenium species.

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

In instances where a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample concentration, the recoveries and the relative percent difference (RPD) are not considered valid indicators of data quality. In such instances, the recoveries of the laboratory fortified blanks (BS) and/or standard reference materials (SRM) demonstrate the accuracy of the applied methods. When the spiking level was less than 25% of the native sample concentration, the spike recovery was not reported (**NR**) and the relative percent difference (RPD) of the MS/MSD set was not calculated (**N/C**).

In cases when either the native sample concentration was non-detectable (reported as less than or equal to the MDL) and/or the corresponding DUP result was also non-detectable, the RPD between the two values was not calculated (**N/C**).

Except for concentration qualifiers, all data were reported without qualification. All associated quality control sample results met the acceptance criteria.

BAL, an accredited laboratory, certifies that the reported results of all analyses for which BAL is NELAP accredited meet all NELAP requirements. For more information, please see the *Report Information* page.

Please feel free to contact us if you have any questions regarding this report.

Sincerely,

Jeremy Maute

Senior Project Manager

Jeremy@brooksapplied.com

Report Information

Laboratory Accreditation

BAL is accredited by the *National Environmental Laboratory Accreditation Program* (NELAP) through the State of Florida Department of Health, Bureau of Laboratories (E87982) and is certified to perform many environmental analyses. BAL is also certified by many other states to perform environmental analyses. For a current list of our accreditations/certifications, please visit our website at <http://www.brooksapplied.com/resources/certificates-permits/> or review Tables 1 and 2 in our Accreditation Information. Results reported relate only to the samples listed in the report.

Field Quality Control Samples

Please be notified that certain EPA methods require the collection of field quality control samples of an appropriate type and frequency; failure to do so is considered a deviation from some methods and for compliance purposes should only be done with the approval of regulatory authorities. Please see the specific EPA methods for details regarding required field quality control samples.

Common Abbreviations

AR	as received	MS	matrix spike
BAL	Brooks Applied Labs	MSD	matrix spike duplicate
BLK	method blank	ND	non-detect
BS	blank spike	NR	non-reportable
CAL	calibration standard	N/C	not calculated
CCB	continuing calibration blank	PS	post preparation spike
CCV	continuing calibration verification	REC	percent recovery
COC	chain of custody record	RPD	relative percent difference
D	dissolved fraction	SCV	secondary calibration verification
DUP	duplicate	SOP	standard operating procedure
IBL	instrument blank	SRM	reference material
ICV	initial calibration verification	T	total fraction
MDL	method detection limit	TR	total recoverable fraction
MRL	method reporting limit		

Definition of Data Qualifiers

(Effective 3/23/2020)

E	An estimated value due to the presence of interferences. A full explanation is presented in the narrative.
H	Holding time and/or preservation requirements not met. Please see narrative for explanation.
J	Detected by the instrument, the result is > the MDL but ≤ the MRL. Result is reported and considered an estimate.
J-1	Estimated value. A full explanation is presented in the narrative.
M	Duplicate precision (RPD) was not within acceptance criteria. Please see narrative for explanation.
N	Spike recovery was not within acceptance criteria. Please see narrative for explanation.
R	Rejected, unusable value. A full explanation is presented in the narrative.
U	Result is ≤ the MDL or client requested reporting limit (CRRL). Result reported as the MDL or CRRL.
X	Result is not BLK-corrected and is within 10x the absolute value of the highest detectable BLK in the batch. Result is estimated.
Z	Holding time and/or preservation requirements not established for this method; however, BAL recommendations for holding time were not followed. Please see narrative for explanation.

These qualifiers are based on those previously utilized by Brooks Applied Labs, those found in the EPA SOW ILM03.0, Exhibit B, Section III, pg. B-18, and the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review; USEPA; January 2010. These supersede all previous qualifiers ever employed by BAL.

Revision 1

Following the submission of the original report on July 25, 2022, it was determined that the **Sample ID** values listed on the chain-of-custody (COC) form were incorrect. Per client request, the **Sample ID** values have been changed for reporting. All sample containers listed a “*WS_LAEMP*” term in place of the “*_LAEMP*” term embedded in the **Sample ID**. In this revised report the **Sample ID** values on the container labels have been used for reporting. No other changes were made in this revised report, with respect to the original report issued on July 25, 2022.

Re: Regional Effects Program

Dear Mike Pope,

On July 7, 2022, Brooks Applied Labs (BAL) received ten (10) aqueous samples. The samples were logged-in for total recoverable selenium [Se], dissolved Se [Se], and Se speciation analyses, according to the chain-of-custody (COC) form.

The **Sample ID** values listed on the chain-of-custody (COC) form did not exactly match the corresponding **Sample ID** values provided on container labels. All sample containers listed a “*WS_LAEMP*” term in place of the “*_LAEMP*” term embedded in the **Sample ID**. Per client request, the samples were logged in and reported using the “*WS_LAEMP*” term in the **Sample ID** values, in accordance with the container labels.

The **Date/Time Collected** value listed on the chain-of-custody (COC) form did not match the corresponding **Date/Time Collected** value listed on container label for 2207062-03. The discrepancy is described in the table below.

Date/Time Collected Discrepancies

Laboratory ID	Sample ID	Date/Time Collected (on COC form)	Date/Time Collected (on container label)
2207062-03	RG_MI3_LAEMP_EVO_2022-06-29_NP_NAL	06/29/2022 12:45	06/29/2022 14:45

2207062-03 was logged in and reported using the **Date/Time Collected** value listed on the COC form (*column 3 in the table above*).

The sample fractions for total recoverable Se and dissolved Se were not preserved in the field. The samples were preserved (pH < 2) upon receipt at BAL. All sample fractions for total recoverable Se and dissolved Se were preserved within the (14 calendar day) preservation holding time.

The sample fractions logged in for Se speciation and dissolved Se had been field-filtered prior to receipt at BAL. All samples were stored according to BAL SOPs.

Total Recoverable Se and Dissolved Se

Each aqueous sample fraction for dissolved Se was digested in a closed vessel (bomb) with nitric and hydrochloric acids. The resulting digests were analyzed for Se content via inductively coupled plasma triple quadrupole mass spectrometry (ICP-QQQ-MS). The ICP-QQQ-MS instrumentation uses advanced interference removal techniques to ensure accuracy of the sample results. For more information, please visit the *Interference Reduction Technology* section on our website, brooksapplied.com.

Selenium Speciation

Each aqueous sample was analyzed for selenium speciation using ion chromatography inductively coupled plasma collision reaction cell mass spectrometry (IC-ICP-CRC-MS). Selenium species are chromatographically separated on an ion exchange column and then quantified using inductively coupled plasma collision reaction cell mass spectrometry (ICP-CRC-MS); for more information on this determinative technique, please visit the *Interference Reduction Technology* section on our website. The chromatographic method applied for the analyses provides greater retention of methylseleninic acid and selenomethionine, allowing for more definitive quantitation of these species.

In accordance with the quotation issued for this project, selenium speciation was defined as dissolved selenite [Se(IV)], selenate [Se(VI)], selenocyanate [SeCN], methylseleninic acid [MeSe(IV)], methaneselenonic acid [MeSe(VI)], selenomethionine [SeMe₂], selenosulfate [SeSO₃], and dimethylselenoxide [DMSeO]. Unknown Se species was defined as the total concentration of all unknown Se species observed during the analysis. This item is identified on the report as [Unk Se Sp].

DMSeO elutes early in the chromatographic run due to the nature of the molecule and the applied chromatographic separation method. Since this species elutes near the dead volume, additional selenium species may coelute. Alternate methods can be applied, upon client request, to increase the separation of DMSeO from potentially co-eluting selenium species.

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

In instances where a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample concentration, the recoveries and the relative percent difference (RPD) are not considered valid indicators of data quality. In such instances, the recoveries of the laboratory fortified blanks (BS) and/or standard reference materials (SRM) demonstrate the accuracy of the applied methods. When the spiking level was less than 25% of the native sample concentration, the spike recovery was not reported (**NR**) and the relative percent difference (RPD) of the MS/MSD set was not calculated (**N/C**).

In cases when either the native sample concentration was non-detectable (reported as less than or equal to the MDL) and/or the corresponding DUP result was also non-detectable, the RPD between the two values was not calculated (**N/C**).

Except for concentration qualifiers, all data were reported without qualification. All associated quality control sample results met the acceptance criteria.

BAL, an accredited laboratory, certifies that the reported results of all analyses for which BAL is NELAP accredited meet all NELAP requirements. For more information, please see the *Report Information* page.

Please feel free to contact us if you have any questions regarding this report.

Sincerely,

A handwritten signature in black ink, appearing to read 'Jeremy Maute', with a stylized flourish at the end.

Report Information

Laboratory Accreditation

BAL is accredited by the *National Environmental Laboratory Accreditation Program* (NELAP) through the State of Florida Department of Health, Bureau of Laboratories (E87982) and is certified to perform many environmental analyses. BAL is also certified by many other states to perform environmental analyses. For a current list of our accreditations/certifications, please visit our website at <http://www.brooksapplied.com/resources/certificates-permits/> or review Tables 1 and 2 in our Accreditation Information. Results reported relate only to the samples listed in the report.

Field Quality Control Samples

Please be notified that certain EPA methods require the collection of field quality control samples of an appropriate type and frequency; failure to do so is considered a deviation from some methods and for compliance purposes should only be done with the approval of regulatory authorities. Please see the specific EPA methods for details regarding required field quality control samples.

Common Abbreviations

AR	as received	MS	matrix spike
BAL	Brooks Applied Labs	MSD	matrix spike duplicate
BLK	method blank	ND	non-detect
BS	blank spike	NR	non-reportable

D	dissolved fraction	SCV	secondary calibration verification
DUP	duplicate	SOP	standard operating procedure
IBL	instrument blank	SRM	reference material
ICV	initial calibration verification	T	total fraction
MDL	method detection limit	TR	total recoverable fraction
MRL	method reporting limit		

Definition of Data Qualifiers

(Effective 3/23/2020)

E	An estimated value due to the presence of interferences. A full explanation is presented in the narrative.
H	Holding time and/or preservation requirements not met. Please see narrative for explanation.
J	Detected by the instrument, the result is > the MDL but ≤ the MRL. Result is reported and considered an estimate.
J-1	Estimated value. A full explanation is presented in the narrative.
M	Duplicate precision (RPD) was not within acceptance criteria. Please see narrative for explanation.
N	Spike recovery was not within acceptance criteria. Please see narrative for explanation.
R	Rejected, unusable value. A full explanation is presented in the narrative.
U	Result is ≤ the MDL or client requested reporting limit (CRRL). Result reported as the MDL or CRRL.
X	Result is not BLK-corrected and is within 10x the absolute value of the highest detectable BLK in the batch. Result is estimated.
Z	Holding time and/or preservation requirements not established for this method; however, BAL recommendations for holding time were not followed. Please see narrative for explanation.

These qualifiers are based on those previously utilized by Brooks Applied Labs, those found in the EPA SOW ILM03.0, Exhibit B, Section III, pg. B-18, and the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review; USEPA; January 2010. These supersede all previous qualifiers ever employed by BAL.

Re: Regional Effects Program

Dear Mike Pope,

On July 7, 2022, Brooks Applied Labs (BAL) received ten (10) . The samples were logged-in for total recoverable selenium [Se], dissolved Se [Se], and Se speciation analyses, according to the chain-of-custody (COC) form.

This report includes the analyses associated with the samples described on the first eight (8) rows of the COC form. The samples described in the last two rows (*RG_FBLANK_WS_LAEMP_EVO_2022-06-28_NP*, 06/28/2022 11:00) and (*RG_FBLANK_WS_LAEMP_EVO_2022-06-28_NP_NAL*, 06/28/2022 11:00) were logged into a separate work order. Results for these two samples are described in a separate report.

The **Sample ID** values listed on the chain-of-custody (COC) form did not exactly match the corresponding **Sample ID** values provided on container labels. All sample containers listed a “*WS_LAEMP*” term in place of the “*_LAEMP*” term embedded in the **Sample ID**. The samples were logged in and reported using the “*WS_LAEMP*” term in the **Sample ID** values, in accordance with the container labels.

The sample fractions for total recoverable Se and dissolved Se were not preserved in the field. The samples were preserved (pH < 2) upon receipt at BAL. All sample fractions for total recoverable Se and dissolved Se were preserved within the (14 calendar day) preservation holding time.

The sample fractions logged in for Se speciation and dissolved Se had been field-filtered prior to receipt at BAL. All samples were stored according to BAL SOPs.

Total Recoverable Se and Dissolved Se

Each aqueous sample fraction for dissolved Se was digested in a closed vessel (bomb) with nitric and hydrochloric acids. The resulting digests were analyzed for Se content via inductively coupled plasma triple quadrupole mass spectrometry (ICP-QQQ-MS). The ICP-QQQ-MS instrumentation uses advanced interference removal techniques to ensure accuracy of the sample results. For more information, please visit the *Interference Reduction Technology* section on our website, brooksapplied.com.

Selenium Speciation

Each aqueous sample was analyzed for selenium speciation using ion chromatography inductively coupled plasma collision reaction cell mass spectrometry (IC-ICP-CRC-MS). Selenium species are chromatographically separated on an ion exchange column and then quantified using inductively coupled

plasma collision reaction cell mass spectrometry (ICP-CRC-MS); for more information on this determinative technique, please visit the *Interference Reduction Technology* section on our website. The chromatographic method applied for the analyses provides greater retention of methylseleninic acid and selenomethionine, allowing for more definitive quantitation of these species.

In accordance with the quotation issued for this project, selenium speciation was defined as dissolved selenite [Se(IV)], selenate [Se(VI)], selenocyanate [SeCN], methylseleninic acid [MeSe(IV)], methaneselenonic acid [MeSe(VI)], selenomethionine [SeMet], selenosulfate [SeSO₃], and dimethylselenoxide [DMSeO]. Unknown Se species was defined as the total concentration of all unknown Se species observed during the analysis. This item is identified on the report as [Unk Se Sp].

DMSeO elutes early in the chromatographic run due to the nature of the molecule and the applied chromatographic separation method. Since this species elutes near the dead volume, additional selenium species may coelute. Alternate methods can be applied, upon client request, to increase the separation of DMSeO from potentially co-eluting selenium species.

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

In instances where a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample concentration, the recoveries and the relative percent difference (RPD) are not considered valid indicators of data quality. In such instances, the recoveries of the laboratory fortified blanks (BS) and/or standard reference materials (SRM) demonstrate the accuracy of the applied methods. When the spiking level was less than 25% of the native sample concentration, the spike recovery was not reported (**NR**) and the relative percent difference (RPD) of the MS/MSD set was not calculated (**N/C**).

In cases when either the native sample concentration was non-detectable (reported as less than or equal to the MDL) and/or the corresponding DUP result was also non-detectable, the RPD between the two values was not calculated (**N/C**).

Except for concentration qualifiers, all data were reported without qualification. All associated quality control sample results met the acceptance criteria.

BAL, an accredited laboratory, certifies that the reported results of all analyses for which BAL is NELAP accredited meet all NELAP requirements. For more information, please see the *Report Information* page.

Please feel free to contact us if you have any questions regarding this report.

Sincerely,

Jeremy Maute

Senior Project Manager

Jeremy@brooksapplied.com

Report Information

Laboratory Accreditation

BAL is accredited by the *National Environmental Laboratory Accreditation Program* (NELAP) through the State of Florida Department of Health, Bureau of Laboratories (E87982) and is certified to perform many environmental analyses. BAL is also certified by many other states to perform environmental analyses. For a current list of our accreditations/certifications, please visit our website at <<http://www.brooksapplied.com/resources/certificates-permits/>> or review Tables 1 and 2 in our Accreditation Information. Results reported relate only to the samples listed in the report.

Field Quality Control Samples

Please be notified that certain EPA methods require the collection of field quality control samples of an appropriate type and frequency; failure to do so is considered a deviation from some methods and for compliance purposes should only be done with the approval of regulatory authorities. Please see the specific EPA methods for details regarding required field quality control samples.

Common Abbreviations

AR	as received	MS	matrix spike
BAL	Brooks Applied Labs	MSD	matrix spike duplicate
BLK	method blank	ND	non-detect
BS	blank spike	NR	non-reportable
CAL	calibration standard	N/C	not calculated
CCB	continuing calibration blank	PS	post preparation spike
CCV	continuing calibration verification	REC	percent recovery
COC	chain of custody record	RPD	relative percent difference
D	dissolved fraction	SCV	secondary calibration verification
DUP	duplicate	SOP	standard operating procedure
IBL	instrument blank	SRM	reference material
ICV	initial calibration verification	T	total fraction
MDL	method detection limit	TR	total recoverable fraction
MRL	method reporting limit		

Definition of Data Qualifiers

(Effective 3/23/2020)

E	An estimated value due to the presence of interferences. A full explanation is presented in the narrative.
H	Holding time and/or preservation requirements not met. Please see narrative for explanation.
J	Detected by the instrument, the result is > the MDL but ≤ the MRL. Result is reported and considered an estimate.
J-1	Estimated value. A full explanation is presented in the narrative.
M	Duplicate precision (RPD) was not within acceptance criteria. Please see narrative for explanation.
N	Spike recovery was not within acceptance criteria. Please see narrative for explanation.
R	Rejected, unusable value. A full explanation is presented in the narrative.
U	Result is ≤ the MDL or client requested reporting limit (CRRL). Result reported as the MDL or CRRL.
X	Result is not BLK-corrected and is within 10x the absolute value of the highest detectable BLK in the batch. Result is estimated.
Z	Holding time and/or preservation requirements not established for this method; however, BAL recommendations for holding time were not followed. Please see narrative for explanation.

These qualifiers are based on those previously utilized by Brooks Applied Labs, those found in the EPA SOW ILM03.0, Exhibit B, Section III, pg. B-18, and the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review; USEPA; January 2010. These supersede all previous qualifiers ever employed by BAL.

Re: Regional Effects Program

Dear Mike Pope,

On July 7, 2022, Brooks Applied Labs (BAL) received ten (10) aqueous samples. The samples were logged-in for total recoverable selenium [Se], dissolved Se [Se], and Se speciation analyses, according to the chain-of-custody (COC) form.

This report includes the analyses associated with the samples described in the last two rows of the COC form (RG_FBLANK_WS_LAEMP_EVO_2022-06-28_NP, 06/28/2022 11:00) and (RG_FBLANK_WS_LAEMP_EVO_2022-06-28_NP_NAL, 06/28/2022 11:00). The samples described on the first eight (8) rows of the COC form were logged into a separate work order. Results for these samples (*first eight rows of the COC form*) are described in a separate report.

The **Date/Time Collected** value listed on the chain-of-custody (COC) form did not match the corresponding **Date/Time Collected** value listed on container label for 2207084-01. The discrepancy is described in the table below.

Date/Time Collected Discrepancies

Laboratory ID	Sample ID	Date/Time Collected (on COC form)	Date/Time Collected (on container label)
2207084-01	RG_FBLANK_WS_LAEMP_EVO_2022-06-28_NP	06/28/2022 11:00	06/28/2022 14:00

2207084-01 was logged in and reported using the **Date/Time Collected** value listed on the COC form (*column 3 in the table above*).

The sample fractions for total recoverable Se and dissolved Se were not preserved in the field. The samples were preserved (pH < 2) upon receipt at BAL. All sample fractions for total recoverable Se and dissolved Se were preserved within the (14 calendar day) preservation holding time.

The sample fractions logged in for Se speciation and dissolved Se had been field-filtered prior to receipt at BAL. All samples were stored according to BAL SOPs.

Total Recoverable Se and Dissolved Se

Each aqueous sample fraction for dissolved Se was digested in a closed vessel (bomb) with nitric and hydrochloric acids. The resulting digests were analyzed for Se content via inductively coupled plasma triple quadrupole mass spectrometry (ICP-QQQ-MS). The ICP-QQQ-MS instrumentation uses advanced interference removal techniques to ensure accuracy of the sample results. For more information, please visit the *Interference Reduction Technology* section on our website, brooksapplied.com.

Selenium Speciation

Each aqueous sample was analyzed for selenium speciation using ion chromatography inductively coupled plasma collision reaction cell mass spectrometry (IC-ICP-CRC-MS). Selenium species are chromatographically separated on an ion exchange column and then quantified using inductively coupled plasma collision reaction cell mass spectrometry (ICP-CRC-MS); for more information on this determinative technique, please visit the *Interference Reduction Technology* section on our website. The chromatographic method applied for the analyses provides greater retention of methylseleninic acid and selenomethionine, allowing for more definitive quantitation of these species.

In accordance with the quotation issued for this project, selenium speciation was defined as dissolved selenite [Se(IV)], selenate [Se(VI)], selenocyanate [SeCM], methylseleninic acid [MeSe(IV)], methaneselenonic acid [MeSe(VI)], selenomethionine [SeMet], selenosulfate [SeSO₃], and dimethylselenoxide [DMSeO]. Unknown Se species was defined as the total concentration of all unknown Se species observed during the analysis. This item is identified on the report as [Unk Se Sp].

DMSeO elutes early in the chromatographic run due to the nature of the molecule and the applied chromatographic separation method. Since this species elutes near the dead volume, additional selenium species may coelute. Alternate methods can be applied, upon client request, to increase the separation of DMSeO from potentially co-eluting selenium species.

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

In instances where a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample concentration, the recoveries and the relative percent difference (RPD) are not considered valid indicators of data quality. In such instances, the recoveries of the laboratory fortified blanks (BS) and/or standard reference materials (SRM) demonstrate the accuracy of the applied methods. When the spiking level was less than 25% of the native sample concentration, the spike recovery was not reported (**NR**) and the relative percent difference (RPD) of the MS/MSD set was not calculated (**N/C**).

In cases when either the native sample concentration was non-detectable (reported as less than or equal to the MDL) and/or the corresponding DUP result was also non-detectable, the RPD between the two values was not calculated (**N/C**).

Except for concentration qualifiers, all data were reported without qualification. All associated quality control sample results met the acceptance criteria.

BAL, an accredited laboratory, certifies that the reported results of all analyses for which BAL is NELAP accredited meet all NELAP requirements. For more information, please see the *Report Information* page.

Please feel free to contact us if you have any questions regarding this report.

Sincerely,

A handwritten signature in black ink, appearing to read 'Jeremy Maute', with a stylized flourish at the end.

Jeremy Maute

Report Information

Laboratory Accreditation

BAL is accredited by the *National Environmental Laboratory Accreditation Program* (NELAP) through the State of Florida Department of Health, Bureau of Laboratories (E87982) and is certified to perform many environmental analyses. BAL is also certified by many other states to perform environmental analyses. For a current list of our accreditations/certifications, please visit our website at <http://www.brooksapplied.com/resources/certificates-permits/> or review Tables 1 and 2 in our Accreditation Information. Results reported relate only to the samples listed in the report.

Field Quality Control Samples

Please be notified that certain EPA methods require the collection of field quality control samples of an appropriate type and frequency; failure to do so is considered a deviation from some methods and for compliance purposes should only be done with the approval of regulatory authorities. Please see the specific EPA methods for details regarding required field quality control samples.

Common Abbreviations

AR	as received	MS	matrix spike
BAL	Brooks Applied Labs	MSD	matrix spike duplicate
BLK	method blank	ND	non-detect
BS	blank spike	NR	non-reportable
CAL	calibration standard	N/C	not calculated
CCB	continuing calibration blank	PS	post preparation spike
CCV	continuing calibration verification	REC	percent recovery
COC	chain of custody record	RPD	relative percent difference
D	dissolved fraction	SCV	secondary calibration verification
DUP	duplicate	SOP	standard operating procedure
IBL	instrument blank	SRM	reference material
ICV	initial calibration verification	T	total fraction
MDL	method detection limit	TR	total recoverable fraction
MRL	method reporting limit		

Definition of Data Qualifiers

(Effective 3/23/2020)

E	An estimated value due to the presence of interferences. A full explanation is presented in the narrative.
H	Holding time and/or preservation requirements not met. Please see narrative for explanation.
J	Detected by the instrument, the result is > the MDL but ≤ the MRL. Result is reported and considered an estimate.
J-1	Estimated value. A full explanation is presented in the narrative.
M	Duplicate precision (RPD) was not within acceptance criteria. Please see narrative for explanation.
N	Spike recovery was not within acceptance criteria. Please see narrative for explanation.
R	Rejected, unusable value. A full explanation is presented in the narrative.
U	Result is ≤ the MDL or client requested reporting limit (CRRL). Result reported as the MDL or CRRL.
X	Result is not BLK-corrected and is within 10x the absolute value of the highest detectable BLK in the batch. Result is estimated.
Z	Holding time and/or preservation requirements not established for this method; however, BAL recommendations for holding time were not followed. Please see narrative for explanation.

These qualifiers are based on those previously utilized by Brooks Applied Labs, those found in the EPA SOW ILM03.0, Exhibit B, Section III, pg. B-18, and the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review; USEPA; January 2010. These supersede all previous qualifiers ever employed by BAL.

Re: Regional Effects Program

Dear Mike Pope,

On July 7, 2022, Brooks Applied Labs (BAL) received twenty (20) aqueous samples. The samples were logged-in for total recoverable selenium [Se], dissolved Se [Se], and Se speciation analyses, according to the chain-of-custody (COC) forms.

On the COC form, *RG_GATE* is used as the **Sample Location (sys_loc_code)** for most of the samples described on page two. Per client request, the *RG_GATE* value should be used for the first two samples on this page of the COC form (2207083-16, 2207083-17, and 2207083-18). For reporting, samples 2207083-19 through 2207083-27 **Sample Location (sys_loc_code)** values have been updated to line up with beginning terms in the **Sample ID** values. Please see the table below for **Sample Location (sys_loc_code)** values used for reporting.

Sample ID/Sample Location (sys_loc_code) Cross Reference Table

Laboratory ID	Sample ID	Sample Location (sys_loc_code) (Provided on COC forms)	Sample Location (sys_loc_code) (Used for Reporting)
2207083-16	RG_GATE_WS_LAEMP_EVO_2022-06-28_NP	RG_GATE	RG_GATE
2207083-17/ 2207083-18	RG_GATE_WS_LAEMP_EVO_2022-06-28_NP_NAL	RG_GATE	RG_GATE
2207083-19	RG_GATEDP_WS_LAEMP_EVO_2022-06-28_NP	RG_GATE	RG_GATEDP
2207083-20/ 2207083-21	RG_GATEDP_WS_LAEMP_EVO_2022-06-28_NP_NAL	RG_GATE	RG_GATEDP
2207083-22	RG_BOCK_WS_LAEMP_EVO_2022-06-28_NP	RG_GATE	RG_BOCK
2207083-23/ 2207083-24	RG_BOCK_WS_LAEMP_EVO_2022-06-28_NP_NAL	RG_GATE	RG_BOCK
2207083-25	RG_BOCKRD_WS_LAEMP_EVO_2022-06-28_NP	RG_GATE	RG_BOCKRD
2207083-26/ 2207083-27	RG_BOCKRD_WS_LAEMP_EVO_2022-06-28_NP_NAL	RG_GATE	RG_BOCKRD

The sample fractions for total recoverable Se and dissolved Se were not preserved in the field. The samples were preserved (pH < 2) upon receipt at BAL. All sample fractions for total recoverable Se and dissolved Se were preserved within the (14 calendar day) preservation holding time.

The sample fractions logged in for Se speciation and dissolved Se had been field-filtered prior to receipt at BAL. All samples were stored according to BAL SOPs.

Total Recoverable Se and Dissolved Se

Each aqueous sample fraction for dissolved Se was digested in a closed vessel (bomb) with nitric and hydrochloric acids. The resulting digests were analyzed for Se content via inductively coupled plasma triple quadrupole mass spectrometry (ICP-QQQ-MS). The ICP-QQQ-MS instrumentation uses advanced interference removal techniques to ensure accuracy of the sample results. For more information, please visit the *Interference Reduction Technology* section on our website, brooksapplied.com.

Selenium Speciation

Each aqueous sample was analyzed for selenium speciation using ion chromatography inductively coupled plasma collision reaction cell mass spectrometry (IC-ICP-CRC-MS). Selenium species are chromatographically separated on an ion exchange column and then quantified using inductively coupled plasma collision reaction cell mass spectrometry (ICP-CRC-MS); for more information on this determinative technique, please visit the *Interference Reduction Technology* section on our website. The chromatographic method applied for the analyses provides greater retention of methylseleninic acid and selenomethionine, allowing for more definitive quantitation of these species.

In accordance with the quotation issued for this project, selenium speciation was defined as dissolved selenite [Se(IV)], selenate [Se(VI)], selenocyanate [SeCN], methylseleninic acid [MeSe(IV)], methaneselenonic acid [MeSe(VI)], selenomethionine [SeMef], selenosulfate [SeSO₃], and dimethylselenoxide [DMSeO]. Unknown Se species was defined as the total concentration of all unknown Se species observed during the analysis. This item is identified on the report as [Unk Se Sp].

DMSeO elutes early in the chromatographic run due to the nature of the molecule and the applied chromatographic separation method. Since this species elutes near the dead volume, additional selenium species may coelute. Alternate methods can be applied, upon client request, to increase the separation of DMSeO from potentially co-eluting selenium species.

Chromatographic interference, as indicated by an elevated baseline, or co-eluting peak, was observed for selenosulfate in samples 2207083-01, 2207083-04, 2207083-07, 2207083-10, and 2207083-13. Due to potential bias, the affected results have been qualified as estimated (**J-1**). Upon client request, Brooks Applied Labs can apply a higher dilution to these samples to potentially mitigate the chromatographic interferences, but a higher dilution would elevate the detection limit for SeMet above the client's requested limit of 0.010µg/L.

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

In instances where a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample concentration, the recoveries and the relative percent difference (RPD) are not considered valid indicators of data quality. In such instances, the recoveries of the laboratory fortified blanks (BS) and/or standard reference materials (SRM) demonstrate the accuracy of the applied methods. When the spiking

level was less than 25% of the native sample concentration, the spike recovery was not reported (**NR**) and the relative percent difference (RPD) of the MS/MSD set was not calculated (**N/C**).

In cases when either the native sample concentration was non-detectable (reported as less than or equal to the MDL) and/or the corresponding DUP result was also non-detectable, the RPD between the two values was not calculated (**N/C**).

Except for concentration qualifiers and items noted above, all data were reported without qualification. All associated quality control sample results met the acceptance criteria.

BAL, an accredited laboratory, certifies that the reported results of all analyses for which BAL is NELAP accredited meet all NELAP requirements. For more information, please see the *Report Information* page.

Please feel free to contact us if you have any questions regarding this report.

Sincerely,

Jeremy Maute
Senior Project Manager

Report Information

Laboratory Accreditation

BAL is accredited by the *National Environmental Laboratory Accreditation Program* (NELAP) through the State of Florida Department of Health, Bureau of Laboratories (E87982) and is certified to perform many environmental analyses. BAL is also certified by many other states to perform environmental analyses. For a current list of our accreditations/certifications, please visit our website at <http://www.brooksapplied.com/resources/certificates-permits/> or review Tables 1 and 2 in our Accreditation Information. Results reported relate only to the samples listed in the report.

Field Quality Control Samples

Please be notified that certain EPA methods require the collection of field quality control samples of an appropriate type and frequency; failure to do so is considered a deviation from some methods and for compliance purposes should only be done with the approval of regulatory authorities. Please see the specific EPA methods for details regarding required field quality control samples.

Common Abbreviations

AR	as received	MS	matrix spike
BAL	Brooks Applied Labs	MSD	matrix spike duplicate
BLK	method blank	ND	non-detect
BS	blank spike	NR	non-reportable
CAL	calibration standard	N/C	not calculated
CCB	continuing calibration blank	PS	post preparation spike
CCV	continuing calibration verification	REC	percent recovery
COC	chain of custody record	RPD	relative percent difference
D	dissolved fraction	SCV	secondary calibration verification
DUP	duplicate	SOP	standard operating procedure
IBL	instrument blank	SRM	reference material
ICV	initial calibration verification	T	total fraction
MDL	method detection limit	TR	total recoverable fraction
MRL	method reporting limit		

Definition of Data Qualifiers

(Effective 3/23/2020)

E	An estimated value due to the presence of interferences. A full explanation is presented in the narrative.
H	Holding time and/or preservation requirements not met. Please see narrative for explanation.
J	Detected by the instrument, the result is > the MDL but ≤ the MRL. Result is reported and considered an estimate.
J-1	Estimated value. A full explanation is presented in the narrative.
M	Duplicate precision (RPD) was not within acceptance criteria. Please see narrative for explanation.
N	Spike recovery was not within acceptance criteria. Please see narrative for explanation.
R	Rejected, unusable value. A full explanation is presented in the narrative.
U	Result is ≤ the MDL or client requested reporting limit (CRRL). Result reported as the MDL or CRRL.
X	Result is not BLK-corrected and is within 10x the absolute value of the highest detectable BLK in the batch. Result is estimated.
Z	Holding time and/or preservation requirements not established for this method; however, BAL recommendations for holding time were not followed. Please see narrative for explanation.

These qualifiers are based on those previously utilized by Brooks Applied Labs, those found in the EPA SOW ILM03.0, Exhibit B, Section III, pg. B-18, and the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review; USEPA; January 2010. These supersede all previous qualifiers ever employed by BAL.

You are correct. The sample ID has the correct sys loc code.

Thanks!

Subject: Question on WO 2207083: Regional Effects Program, REP Project - Confidential
Importance: High

I am going to review and report the analyses for work order 2207083 (see attached COC form).

Please see page two of the COC forms. On the COC form, *RG_GATE* is used as the **Sample Location (sys_loc_code)** for most of the samples described on page two. It looks like the *RG_GATE* value should be used for the first two samples (2207083-16, 2207083-17, and 2207083-18). But I think there is a chance your group intended to use different **Sample Location (sys_loc_code)** values for the remaining samples. Please see the summary in the table below.

Sample ID/Sample Location (sys_loc_code) Cross Reference Table

Laboratory ID	Sample ID	Sample Location (sys_loc_code)	Analytical Parameter
2207083-16	RG_GATE_WS_LAEMP_EVO_2022-06-28_NP	RG_GATE	Se Speciation
2207083-17/ 2207083-18	RG_GATE_WS_LAEMP_EVO_2022-06-28_NP_NAL	RG_GATE	Dissolved Se/Total Recoverable Se
2207083-19	RG_GATEDP_WS_LAEMP_EVO_2022-06-28_NP	RG_GATE	Se Speciation
2207083-20/ 2207083-21	RG_GATEDP_WS_LAEMP_EVO_2022-06-28_NP_NAL	RG_GATE	Dissolved Se/Total Recoverable Se
2207083-22	RG_BOCK_WS_LAEMP_EVO_2022-06-28_NP	RG_GATE	Se Speciation
2207083-23/ 2207083-24	RG_BOCK_WS_LAEMP_EVO_2022-06-28_NP_NAL	RG_GATE	Dissolved Se/Total Recoverable Se
2207083-25	RG_BOCKRD_WS_LAEMP_EVO_2022-06-28_NP	RG_GATE	Se Speciation
2207083-26/ 2207083-27	RG_BOCKRD_WS_LAEMP_EVO_2022-06-28_NP_NAL	RG_GATE	Dissolved Se/Total Recoverable Se

It seems as though samples 2207083-19 through 2207083-27 should have updated **Sample Location (sys_loc_code)** values, perhaps **Sample Location (sys_loc_code)** values that line up with beginning terms in the **Sample ID** values. I could be wrong, but could you take a look and let me know? I intend to get this report out within the hour.

Thanks everyone.

Re: Regional Effects Program

Dear Mike Pope,

On August 4, 2022, Brooks Applied Labs (BAL) received two (2) aqueous samples. The samples were logged-in for total recoverable selenium [Se], dissolved Se [Se], and Se speciation analyses, according to the chain-of-custody (COC) form.

The following sample was described on the COC form but there were no containers matching this information present in the sample shipment.

Laboratory ID	Sample ID	Analytical Parameter
2208056-02	EV_MC3a_WS_LAEMP_EVO_2022-07-27_NP-NAL	Total Recoverable Se

An additional container was received with no information on the container label. The container type matched those used for total recoverable/dissolved Se fractions. Since there were no other fractions missing, except for 2208056-02, the unlabeled sample was assigned to 2208056-02 for total recoverable Se analysis. Results are reported for 2208056-02, however the field ID assignment for this sample is still uncertain.

The sample fractions for total recoverable Se and dissolved Se were not preserved in the field. The samples were preserved (pH < 2) upon receipt at BAL. All sample fractions for total recoverable Se and dissolved Se were preserved within the (14 calendar day) preservation holding time.

The sample fractions logged in for Se speciation and dissolved Se had been field-filtered prior to receipt at BAL. All samples were stored according to BAL SOPs.

Total Recoverable Se and Dissolved Se

Each aqueous sample fraction for dissolved Se was digested in a closed vessel (bomb) with nitric and hydrochloric acids. The resulting digests were analyzed for Se content via inductively coupled plasma triple quadrupole mass spectrometry (ICP-QQQ-MS). The ICP-QQQ-MS instrumentation uses advanced interference removal techniques to ensure accuracy of the sample results. For more information, please visit the *Interference Reduction Technology* section on our website, brooksapplied.com.

Selenium Speciation

Each aqueous sample was analyzed for selenium speciation using ion chromatography inductively coupled plasma collision reaction cell mass spectrometry (IC-ICP-CRC-MS). Selenium species are chromatographically separated on an ion exchange column and then quantified using inductively coupled plasma collision reaction cell mass spectrometry (ICP-CRC-MS); for more information on this determinative technique, please visit the *Interference Reduction Technology* section on our website. The chromatographic method applied for the analyses provides greater retention of methylseleninic acid and selenomethionine, allowing for more definitive quantitation of these species.

In accordance with the quotation issued for this project, selenium speciation was defined as dissolved selenite [Se(IV)], selenate [Se(VI)], selenocyanate [SeCN], methylseleninic acid [MeSe(IV)], methaneselenonic acid [MeSe(VI)], selenomethionine [SeMef], selenosulfate [SeSO₃], and dimethylselenoxide [DMSeO]. Unknown Se species was defined as the total concentration of all unknown Se species observed during the analysis. This item is identified on the report as [Unk Se Sp].

DMSeO elutes early in the chromatographic run due to the nature of the molecule and the applied chromatographic separation method. Since this species elutes near the dead volume, additional selenium species may coelute. Alternate methods can be applied, upon client request, to increase the separation of DMSeO from potentially co-eluting selenium species.

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

In instances where a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample concentration, the recoveries and the relative percent difference (RPD) are not considered valid indicators of data quality. In such instances, the recoveries of the laboratory fortified blanks (BS) and/or standard reference materials (SRM) demonstrate the accuracy of the applied methods. When the spiking level was less than 25% of the native sample concentration, the spike recovery was not reported (**NR**) and the relative percent difference (RPD) of the MS/MSD set was not calculated (**N/C**).

In cases when either the native sample concentration was non-detectable (reported as less than or equal to the MDL) and/or the corresponding DUP result was also non-detectable, the RPD between the two values was not calculated (**N/C**).

Except for concentration qualifiers, all data were reported without qualification. All associated quality control sample results met the acceptance criteria.

BAL, an accredited laboratory, certifies that the reported results of all analyses for which BAL is NELAP accredited meet all NELAP requirements. For more information, please see the *Report Information* page.

Please feel free to contact us if you have any questions regarding this report.

Sincerely,

A handwritten signature in black ink, appearing to read 'Jeremy Maute', written in a cursive style.

Jeremy Maute
Senior Project Manager

Jeremy@brooksapplied.com

Report Information

Laboratory Accreditation

BAL is accredited by the *National Environmental Laboratory Accreditation Program* (NELAP) through the State of Florida Department of Health, Bureau of Laboratories (E87982) and is certified to perform many environmental analyses. BAL is also certified by many other states to perform environmental analyses. For a current list of our accreditations/certifications, please visit our website at <http://www.brooksapplied.com/resources/certificates-permits/> or review Tables 1 and 2 in our Accreditation Information. Results reported relate only to the samples listed in the report.

Field Quality Control Samples

Please be notified that certain EPA methods require the collection of field quality control samples of an appropriate type and frequency; failure to do so is considered a deviation from some methods and for compliance purposes should only be done with the approval of regulatory authorities. Please see the specific EPA methods for details regarding required field quality control samples.

Common Abbreviations

AR	as received	MS	matrix spike
BAL	Brooks Applied Labs	MSD	matrix spike duplicate
BLK	method blank	ND	non-detect
BS	blank spike	NR	non-reportable
CAL	calibration standard	N/C	not calculated
CCB	continuing calibration blank	PS	post preparation spike
CCV	continuing calibration verification	REC	percent recovery
COC	chain of custody record	RPD	relative percent difference
D	dissolved fraction	SCV	secondary calibration verification
DUP	duplicate	SOP	standard operating procedure
IBL	instrument blank	SRM	reference material
ICV	initial calibration verification	T	total fraction
MDL	method detection limit	TR	total recoverable fraction
MRL	method reporting limit		

Definition of Data Qualifiers

(Effective 3/23/2020)

E	An estimated value due to the presence of interferences. A full explanation is presented in the narrative.
H	Holding time and/or preservation requirements not met. Please see narrative for explanation.
J	Detected by the instrument, the result is > the MDL but ≤ the MRL. Result is reported and considered an estimate.
J-1	Estimated value. A full explanation is presented in the narrative.
M	Duplicate precision (RPD) was not within acceptance criteria. Please see narrative for explanation.
N	Spike recovery was not within acceptance criteria. Please see narrative for explanation.
R	Rejected, unusable value. A full explanation is presented in the narrative.
U	Result is ≤ the MDL or client requested reporting limit (CRRL). Result reported as the MDL or CRRL.
X	Result is not BLK-corrected and is within 10x the absolute value of the highest detectable BLK in the batch. Result is estimated.
Z	Holding time and/or preservation requirements not established for this method; however, BAL recommendations for holding time were not followed. Please see narrative for explanation.

These qualifiers are based on those previously utilized by Brooks Applied Labs, those found in the EPA SOW ILM03.0, Exhibit B, Section III, pg. B-18, and the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review; USEPA; January 2010. These supersede all previous qualifiers ever employed by BAL.

Re: Regional Effects Program

Dear Mike Pope,

On August 4, 2022, Brooks Applied Labs (BAL) received forty (40) aqueous samples. The samples were logged-in for total recoverable selenium [Se], dissolved Se [Se], and Se speciation analyses, according to the chain-of-custody (COC) forms.

Date/Time Collected values listed on the chain-of-custody (COC) form did not exactly match the corresponding **Date/Time Collected** values on the container labels. The discrepancies are described in the table below.

Date/Time Collected Discrepancies

Laboratory ID	Sample ID	Date/Time Collected (on COC form)	Date/Time Collected (on container label)
2208059-23	RG_MIDGA_WS_LAEMP_EVO_2022-07-26_N	07/25/2022 08:45	07/26/2022 08:45
2208059-25	RG_MICOMP_WS_LAEMP_EVO_2022-07-26_N	07/25/2022 07:00	07/26/2022 07:00
2208059-26	RG_RIVER_WS_LAEMP_EVO_2022-07-26_N	07/25/2022 08.15	07/26/2022 08.15

Per request, samples 2208059-23, 2208059-25, and 2208059-26 were logged in and reported using the **Date/Time Collected** values listed on the container labels (*column 4 in the table above*).

The Se speciation fraction 2208059-52 (*RG_ERCKUC_WS_LAEMP_EVO_2022-07-27_N*) was not filtered in the field. 2208059-52 was filtered (0.45 µm) by BAL staff upon receipt. The filtration took place beyond the (2-calander day) filtration holding time. Consequently, the Se speciation results for 2208059-52 are qualified (Z) for the filtration holding time violation. The remaining fractions logged in for Se speciation and dissolved Se were filtered (0.45 µm) within the (2-calander day) filtration holding time.

The sample fractions for total recoverable Se and dissolved Se were not preserved in the field. The samples were preserved (pH < 2) upon receipt at BAL. All sample fractions for total recoverable Se and dissolved Se were preserved within the (14 calendar day) preservation holding time.

The sample fractions logged in for Se speciation and dissolved Se had been field-filtered prior to receipt at BAL. All samples were stored according to BAL SOPs.

Total Recoverable Se and Dissolved Se

Each aqueous sample fraction for dissolved Se was digested in a closed vessel (bomb) with nitric and hydrochloric acids. The resulting digests were analyzed for Se content via inductively coupled plasma triple quadrupole mass spectrometry (ICP-QQQ-MS). The ICP-QQQ-MS instrumentation uses advanced interference removal techniques to ensure accuracy of the sample results. For more information, please visit the *Interference Reduction Technology* section on our website, brooksapplied.com.

Selenium Speciation

Each aqueous sample was analyzed for selenium speciation using ion chromatography inductively coupled plasma collision reaction cell mass spectrometry (IC-ICP-CRC-MS). Selenium species are chromatographically separated on an ion exchange column and then quantified using inductively coupled plasma collision reaction cell mass spectrometry (ICP-CRC-MS); for more information on this determinative technique, please visit the *Interference Reduction Technology* section on our website. The chromatographic method applied for the analyses provides greater retention of methylseleninic acid and selenomethionine, allowing for more definitive quantitation of these species.

In accordance with the quotation issued for this project, selenium speciation was defined as dissolved selenite [Se(IV)], selenate [Se(VI)], selenocyanate [SeCN], methylseleninic acid [MeSe(IV)], methaneselenonic acid [MeSe(VI)], selenomethionine [SeMet], selenosulfate [SeSO₃], and dimethylselenoxide [DMSeO]. Unknown Se species was defined as the total concentration of all unknown Se species observed during the analysis. This item is identified on the report as [Unk Se Sp].

DMSeO elutes early in the chromatographic run due to the nature of the molecule and the applied chromatographic separation method. Since this species elutes near the dead volume, additional selenium species may coelute. Alternate methods can be applied, upon client request, to increase the separation of DMSeO from potentially co-eluting selenium species.

The Se speciation results for 2208059-52 are qualified (**Z**) due to filtration beyond the (2-calendar day) filtration holding time.

Chromatographic interference, as indicated by an elevated baseline, or co-eluting peak, was observed for selenosulfate in 2208059-29 and 2208059-56. Due to potential bias, the affected data have been qualified as estimated (**J-1**). Upon client request, Brooks Applied Labs can apply a higher dilution to these samples to potentially mitigate the chromatographic interferences, but a higher dilution would elevate the detection limit for SeMet above the client's requested limit of 0.010µg/L.

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

In instances where a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample concentration, the recoveries and the relative percent difference (RPD) are not considered valid indicators of data quality. In such instances, the recoveries of the laboratory fortified blanks (BS) and/or standard reference materials (SRM) demonstrate the accuracy of the applied methods. When the spiking level was less than 25% of the native sample concentration, the spike recovery was not reported (**NR**) and the relative percent difference (RPD) of the MS/MSD set was not calculated (**N/C**).

In cases when either the native sample concentration was non-detectable (reported as less than or equal to the MDL) and/or the corresponding DUP result was also non-detectable, the RPD between the two values was not calculated (**N/C**).

Except for concentration qualifiers and items noted above, all data were reported without qualification. All associated quality control sample results met the acceptance criteria.

BAL, an accredited laboratory, certifies that the reported results of all analyses for which BAL is NELAP accredited meet all NELAP requirements. For more information, please see the *Report Information* page.

Please feel free to contact us if you have any questions regarding this report.

Sincerely,

Jeremy Maute

Senior Project Manager

Jeremy@brooksapplied.com

Report Information

Laboratory Accreditation

BAL is accredited by the *National Environmental Laboratory Accreditation Program* (NELAP) through the State of Florida Department of Health, Bureau of Laboratories (E87982) and is certified to perform many environmental analyses. BAL is also certified by many other states to perform environmental analyses. For a current list of our accreditations/certifications, please visit our website at <http://www.brooksapplied.com/resources/certificates-permits/> or review Tables 1 and 2 in our Accreditation Information. Results reported relate only to the samples listed in the report.

Field Quality Control Samples

Please be notified that certain EPA methods require the collection of field quality control samples of an appropriate type and frequency; failure to do so is considered a deviation from some methods and for compliance purposes should only be done with the approval of regulatory authorities. Please see the specific EPA methods for details regarding required field quality control samples.

Common Abbreviations

AR	as received	MS	matrix spike
BAL	Brooks Applied Labs	MSD	matrix spike duplicate
BLK	method blank	ND	non-detect
BS	blank spike	NR	non-reportable
CAL	calibration standard	N/C	not calculated
CCB	continuing calibration blank	PS	post preparation spike
CCV	continuing calibration verification	REC	percent recovery
COC	chain of custody record	RPD	relative percent difference
D	dissolved fraction	SCV	secondary calibration verification
DUP	duplicate	SOP	standard operating procedure
IBL	instrument blank	SRM	reference material
ICV	initial calibration verification	T	total fraction
MDL	method detection limit	TR	total recoverable fraction
MRL	method reporting limit		

Definition of Data Qualifiers

(Effective 3/23/2020)

E	An estimated value due to the presence of interferences. A full explanation is presented in the narrative.
H	Holding time and/or preservation requirements not met. Please see narrative for explanation.
J	Detected by the instrument, the result is > the MDL but ≤ the MRL. Result is reported and considered an estimate.
J-1	Estimated value. A full explanation is presented in the narrative.
M	Duplicate precision (RPD) was not within acceptance criteria. Please see narrative for explanation.
N	Spike recovery was not within acceptance criteria. Please see narrative for explanation.
R	Rejected, unusable value. A full explanation is presented in the narrative.
U	Result is ≤ the MDL or client requested reporting limit (CRRL). Result reported as the MDL or CRRL.
X	Result is not BLK-corrected and is within 10x the absolute value of the highest detectable BLK in the batch. Result is estimated.
Z	Holding time and/or preservation requirements not established for this method; however, BAL recommendations for holding time were not followed. Please see narrative for explanation.

These qualifiers are based on those previously utilized by Brooks Applied Labs, those found in the EPA SOW ILM03.0, Exhibit B, Section III, pg. B-18, and the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review; USEPA; January 2010. These supersede all previous qualifiers ever employed by BAL.

Accreditation Information

Table 1. Accredited method/matrix/analytes for TNI
Issued by: State of Florida Dept. of Health (The NELAC Institute 2016 Standard)
Issued on: July 1, 2021; Valid to: June 30, 2022
Certificate Number: E87982-37

Method	Matrix	TNI Accredited Analyte(s)
EPA 1638	Non-Potable Waters	Ag, Cd, Cu, Ni, Pb, Sb, Se, Ti, Zn
EPA 200.8	Non-Potable Waters	Ag, Al, As, Ba, Be, Cd, Co, Cr, Cu, Mn, Mo, Ni, Pb, Sb, Se, Ti, U, V, Zn
EPA 6020	Non-Potable Waters	Ag, Al, As, Ba, Be, Ca, Cd, Co, Cr, Cu, Fe, Mg, Mn, Mo, Ni, Pb, Sb, Se, Ti, U, V, Zn
	Solids/Chemicals & Biological	Ag, Al, As, Ba, Be, Ca, Cd, Co, Cr, Cu, Fe, Mg, Mn, Mo, Ni, Pb, Sb, Se, Ti, V, Zn

Re: Regional Effects Program

Dear Mike Pope,

On September 22, 2022, Brooks Applied Labs (BAL) received twenty-six (26) aqueous samples. The samples were logged-in for total recoverable selenium [Se], dissolved Se [Se], and Se speciation analyses, according to the chain-of-custody (COC) form.

The Date/Time Collected value listed on the chain-of-custody (COC) forms did not exactly match the corresponding **Date/Time Collected** value on the container label for 2209285-26. The discrepancy is described in the table below.

Date/Time Collected Discrepancies

Laboratory ID	Sample ID	Date/Time Collected (on COC form)	Date/Time Collected (on container label)
2209285-26	RG_MICOMP_WS_LAEMP_EVO_2022-09_NP-NAL	09/18/2022 17:00	09/18/2022 17:10

2209285-26 was logged in and reported using the **Date/Time Collected** value listed on the COC forms (*column 3 in the table above*).

The sample fractions for total recoverable Se and dissolved Se were not preserved in the field. The samples were preserved (pH < 2) upon receipt at BAL. All sample fractions for total recoverable Se and dissolved Se were preserved within the (14 calendar day) preservation holding time.

The sample fractions logged in for Se speciation and dissolved Se had been field-filtered prior to receipt at BAL. All samples were stored according to BAL SOPs.

Total Recoverable Se and Dissolved Se

Each aqueous sample fraction for dissolved Se was digested in a closed vessel (bomb) with nitric and hydrochloric acids. The resulting digests were analyzed for Se content via inductively coupled plasma triple quadrupole mass spectrometry (ICP-QQQ-MS). The ICP-QQQ-MS instrumentation uses advanced interference removal techniques to ensure accuracy of the sample results. For more information, please visit the *Interference Reduction Technology* section on our website, brooksapplied.com.

Selenium Speciation

Each aqueous sample was analyzed for selenium speciation using ion chromatography inductively coupled plasma collision reaction cell mass spectrometry (IC-ICP-CRC-MS). Selenium species are chromatographically separated on an ion exchange column and then quantified using inductively coupled plasma collision reaction cell mass spectrometry (ICP-CRC-MS); for more information on this determinative technique, please visit the *Interference Reduction Technology* section on our website. The chromatographic method applied for the analyses provides greater retention of methylseleninic acid and selenomethionine, allowing for more definitive quantitation of these species.

In accordance with the quotation issued for this project, selenium speciation was defined as dissolved selenite [Se(IV)], selenate [Se(VI)], selenocyanate [SeCN], methylseleninic acid [MeSe(IV)], methaneselenonic acid [MeSe(VI)], selenomethionine [SeMef], selenosulfate [SeSO₃], and dimethylselenoxide [DMSeO]. Unknown Se species was defined as the total concentration of all unknown Se species observed during the analysis. This item is identified on the report as [Unk Se Sp].

DMSeO elutes early in the chromatographic run due to the nature of the molecule and the applied chromatographic separation method. Since this species elutes near the dead volume, additional selenium species may coelute. Alternate methods can be applied, upon client request, to increase the separation of DMSeO from potentially co-eluting selenium species.

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

In instances where a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample concentration, the recoveries and the relative percent difference (RPD) are not considered valid indicators of data quality. In such instances, the recoveries of the laboratory fortified blanks (BS) and/or standard reference materials (SRM) demonstrate the accuracy of the applied methods. When the spiking level was less than 25% of the native sample concentration, the spike recovery was not reported (**NR**) and the relative percent difference (RPD) of the MS/MSD set was not calculated (**N/C**).

In cases when either the native sample concentration was non-detectable (reported as less than or equal to the MDL) and/or the corresponding DUP result was also non-detectable, the RPD between the two values was not calculated (**N/C**).

Except for concentration qualifiers, all data were reported without qualification. All associated quality control sample results met the acceptance criteria.

BAL, an accredited laboratory, certifies that the reported results of all analyses for which BAL is NELAP accredited meet all NELAP requirements. For more information, please see the *Report Information* page.

Please feel free to contact us if you have any questions regarding this report.

Sincerely,

A handwritten signature in black ink, appearing to read 'Jeremy Maute', written over a light blue horizontal line.

Jeremy Maute

Senior Project Manager

Jeremy@brooksapplied.com

Report Information

Laboratory Accreditation

BAL is accredited by the *National Environmental Laboratory Accreditation Program* (NELAP) through the State of Florida Department of Health, Bureau of Laboratories (E87982) and is certified to perform many environmental analyses. BAL is also certified by many other states to perform environmental analyses. For a current list of our accreditations/certifications, please visit our website at <http://www.brooksapplied.com/resources/certificates-permits/> or review Tables 1 and 2 in our Accreditation Information. Results reported relate only to the samples listed in the report.

Field Quality Control Samples

Please be notified that certain EPA methods require the collection of field quality control samples of an appropriate type and frequency; failure to do so is considered a deviation from some methods and for compliance purposes should only be done with the approval of regulatory authorities. Please see the specific EPA methods for details regarding required field quality control samples.

Common Abbreviations

AR	as received	MS	matrix spike
BAL	Brooks Applied Labs	MSD	matrix spike duplicate
BLK	method blank	ND	non-detect
BS	blank spike	NR	non-reportable
CAL	calibration standard	N/C	not calculated
CCB	continuing calibration blank	PS	post preparation spike
CCV	continuing calibration verification	REC	percent recovery
COC	chain of custody record	RPD	relative percent difference
D	dissolved fraction	SCV	secondary calibration verification
DUP	duplicate	SOP	standard operating procedure
IBL	instrument blank	SRM	reference material
ICV	initial calibration verification	T	total fraction
MDL	method detection limit	TR	total recoverable fraction
MRL	method reporting limit		

Definition of Data Qualifiers

(Effective 3/23/2020)

E	An estimated value due to the presence of interferences. A full explanation is presented in the narrative.
H	Holding time and/or preservation requirements not met. Please see narrative for explanation.
J	Detected by the instrument, the result is > the MDL but ≤ the MRL. Result is reported and considered an estimate.
J-1	Estimated value. A full explanation is presented in the narrative.
M	Duplicate precision (RPD) was not within acceptance criteria. Please see narrative for explanation.
N	Spike recovery was not within acceptance criteria. Please see narrative for explanation.
R	Rejected, unusable value. A full explanation is presented in the narrative.
U	Result is ≤ the MDL or client requested reporting limit (CRRL). Result reported as the MDL or CRRL.
X	Result is not BLK-corrected and is within 10x the absolute value of the highest detectable BLK in the batch. Result is estimated.
Z	Holding time and/or preservation requirements not established for this method; however, BAL recommendations for holding time were not followed. Please see narrative for explanation.

These qualifiers are based on those previously utilized by Brooks Applied Labs, those found in the EPA SOW ILM03.0, Exhibit B, Section III, pg. B-18, and the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review; USEPA; January 2010. These supersede all previous qualifiers ever employed by BAL.

Re: Regional Effects Program

Dear Mike Pope,

On September 22, 2022, Brooks Applied Labs (BAL) received two (2) aqueous samples. The samples were logged-in for total recoverable selenium [Se], dissolved Se [Se], and Se speciation analyses, according to the chain-of-custody (COC) form.

The **Sample ID** values listed on the chain-of-custody (COC) form did not exactly match the corresponding **Sample ID** values on the container labels for 2209286-02 and 2209286-03. The discrepancies are described in the table below.

Sample ID Agreement Between COC and Container Labels

Laboratory ID	Sample ID (on COC form)	Sample ID (on container label)
2209286-02/ 2209286-03	RG_ERCKUC_WS_LAEMP_EVO_2022- 09_NP-NAL	RG_ERCKUC_LAEMP_EVO_2022-09_NP-NAL

2209286-02 and 2209286-03 were logged in and reported using the **Sample ID** values listed on the COC form (*column 2 in the table above*).

The sample fractions for total recoverable Se and dissolved Se were not preserved in the field. The samples were preserved (pH < 2) upon receipt at BAL. All sample fractions for total recoverable Se and dissolved Se were preserved within the (14 calendar day) preservation holding time.

The sample fractions logged in for Se speciation and dissolved Se had been field-filtered prior to receipt at BAL. All samples were stored according to BAL SOPs.

Total Recoverable Se and Dissolved Se

Each aqueous sample fraction for dissolved Se was digested in a closed vessel (bomb) with nitric and hydrochloric acids. The resulting digests were analyzed for Se content via inductively coupled plasma triple quadrupole mass spectrometry (ICP-QQQ-MS). The ICP-QQQ-MS instrumentation uses advanced interference removal techniques to ensure accuracy of the sample results. For more information, please visit the *Interference Reduction Technology* section on our website, brooksapplied.com.

Selenium Speciation

Each aqueous sample was analyzed for selenium speciation using ion chromatography inductively coupled plasma collision reaction cell mass spectrometry (IC-ICP-CRC-MS). Selenium species are chromatographically separated on an ion exchange column and then quantified using inductively coupled plasma collision reaction cell mass spectrometry (ICP-CRC-MS); for more information on this determinative technique, please visit the *Interference Reduction Technology* section on our website. The chromatographic method applied for the analyses provides greater retention of methylseleninic acid and selenomethionine, allowing for more definitive quantitation of these species.

In accordance with the quotation issued for this project, selenium speciation was defined as dissolved selenite [Se(IV)], selenate [Se(VI)], selenocyanate [SeCN], methylseleninic acid [MeSe(IV)], methaneselenonic acid [MeSe(VI)], selenomethionine [SeMef], selenosulfate [SeSO₃], and dimethylselenoxide [DMSeO]. Unknown Se species was defined as the total concentration of all unknown Se species observed during the analysis. This item is identified on the report as [Unk Se Sp].

DMSeO elutes early in the chromatographic run due to the nature of the molecule and the applied chromatographic separation method. Since this species elutes near the dead volume, additional selenium species may coelute. Alternate methods can be applied, upon client request, to increase the separation of DMSeO from potentially co-eluting selenium species.

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

In instances where a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample concentration, the recoveries and the relative percent difference (RPD) are not considered valid indicators of data quality. In such instances, the recoveries of the laboratory fortified blanks (BS) and/or standard reference materials (SRM) demonstrate the accuracy of the applied methods. When the spiking level was less than 25% of the native sample concentration, the spike recovery was not reported (**NR**) and the relative percent difference (RPD) of the MS/MSD set was not calculated (**N/C**).

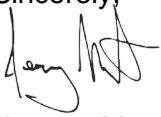

In cases when either the native sample concentration was non-detectable (reported as less than or equal to the MDL) and/or the corresponding DUP result was also non-detectable, the RPD between the two values was not calculated (**N/C**).

Except for concentration qualifiers, all data were reported without qualification. All associated quality control sample results met the acceptance criteria.

BAL, an accredited laboratory, certifies that the reported results of all analyses for which BAL is NELAP accredited meet all NELAP requirements. For more information, please see the *Report Information* page.

Please feel free to contact us if you have any questions regarding this report.

Sincerely,

A handwritten signature in black ink, appearing to read 'Jeremy Maute', with a stylized flourish at the end.

Report Information

Laboratory Accreditation

BAL is accredited by the *National Environmental Laboratory Accreditation Program* (NELAP) through the State of Florida Department of Health, Bureau of Laboratories (E87982) and is certified to perform many environmental analyses. BAL is also certified by many other states to perform environmental analyses. For a current list of our accreditations/certifications, please visit our website at <http://www.brooksapplied.com/resources/certificates-permits/> or review Tables 1 and 2 in our Accreditation Information. Results reported relate only to the samples listed in the report.

Field Quality Control Samples

Please be notified that certain EPA methods require the collection of field quality control samples of an appropriate type and frequency; failure to do so is considered a deviation from some methods and for compliance purposes should only be done with the approval of regulatory authorities. Please see the specific EPA methods for details regarding required field quality control samples.

Common Abbreviations

AR	as received	MS	matrix spike
BAL	Brooks Applied Labs	MSD	matrix spike duplicate
BLK	method blank	ND	non-detect
BS	blank spike	NR	non-reportable
CAL	calibration standard	N/C	not calculated
CCB	continuing calibration blank	PS	post preparation spike
CCV	continuing calibration verification	REC	percent recovery
COC	chain of custody record	RPD	relative percent difference
D	dissolved fraction	SCV	secondary calibration verification
DUP	duplicate	SOP	standard operating procedure
IBL	instrument blank	SRM	reference material
ICV	initial calibration verification	T	total fraction
MDL	method detection limit	TR	total recoverable fraction
MRL	method reporting limit		

Definition of Data Qualifiers

(Effective 3/23/2020)

E	An estimated value due to the presence of interferences. A full explanation is presented in the narrative.
H	Holding time and/or preservation requirements not met. Please see narrative for explanation.
J	Detected by the instrument, the result is > the MDL but ≤ the MRL. Result is reported and considered an estimate.
J-1	Estimated value. A full explanation is presented in the narrative.
M	Duplicate precision (RPD) was not within acceptance criteria. Please see narrative for explanation.
N	Spike recovery was not within acceptance criteria. Please see narrative for explanation.
R	Rejected, unusable value. A full explanation is presented in the narrative.
U	Result is ≤ the MDL or client requested reporting limit (CRRL). Result reported as the MDL or CRRL.
X	Result is not BLK-corrected and is within 10x the absolute value of the highest detectable BLK in the batch. Result is estimated.
Z	Holding time and/or preservation requirements not established for this method; however, BAL recommendations for holding time were not followed. Please see narrative for explanation.

These qualifiers are based on those previously utilized by Brooks Applied Labs, those found in the EPA SOW ILM03.0, Exhibit B, Section III, pg. B-18, and the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review; USEPA; January 2010. These supersede all previous qualifiers ever employed by BAL.

Re: Regional Effects Program

Dear Mike Pope,

On September 29, 2022, Brooks Applied Labs (BAL) received two (2) aqueous samples. The samples were logged-in for total recoverable selenium [Se], dissolved Se [Se], and Se speciation analyses, according to the chain-of-custody (COC) form.

The sample fractions for total recoverable Se and dissolved Se were not preserved in the field. The samples were preserved (pH < 2) upon receipt at BAL. All sample fractions for total recoverable Se and dissolved Se were preserved within the (14 calendar day) preservation holding time.

The sample fractions logged in for Se speciation and dissolved Se had been field-filtered prior to receipt at BAL. All samples were stored according to BAL SOPs.

Total Recoverable Se and Dissolved Se

Each aqueous sample fraction for dissolved Se was digested in a closed vessel (bomb) with nitric and hydrochloric acids. The resulting digests were analyzed for Se content via inductively coupled plasma triple quadrupole mass spectrometry (ICP-QQQ-MS). The ICP-QQQ-MS instrumentation uses advanced interference removal techniques to ensure accuracy of the sample results. For more information, please visit the *Interference Reduction Technology* section on our website, brooksapplied.com.

Selenium Speciation

Each aqueous sample was analyzed for selenium speciation using ion chromatography inductively coupled plasma collision reaction cell mass spectrometry (IC-ICP-CRC-MS). Selenium species are chromatographically separated on an ion exchange column and then quantified using inductively coupled plasma collision reaction cell mass spectrometry (ICP-CRC-MS); for more information on this determinative technique, please visit the *Interference Reduction Technology* section on our website. The chromatographic method applied for the analyses provides greater retention of methylseleninic acid and selenomethionine, allowing for more definitive quantitation of these species.

In accordance with the quotation issued for this project, selenium speciation was defined as dissolved selenite [Se(IV)], selenate [Se(VI)], selenocyanate [SeCN], methylseleninic acid [MeSe(IV)], methaneselenonic acid [MeSe(VI)], selenomethionine [SeMe], selenosulfate [SeSO₃], and dimethylselenoxide [DMSeO]. Unknown Se species was defined as the total concentration of all unknown Se species observed during the analysis. This item is identified on the report as [Unk Se Sp].

DMSeO elutes early in the chromatographic run due to the nature of the molecule and the applied chromatographic separation method. Since this species elutes near the dead volume, additional selenium species may coelute. Alternate methods can be applied, upon client request, to increase the separation of DMSeO from potentially co-eluting selenium species.

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

In instances where a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample concentration, the recoveries and the relative percent difference (RPD) are not considered valid indicators of data quality. In such instances, the recoveries of the laboratory fortified blanks (BS) and/or standard reference materials (SRM) demonstrate the accuracy of the applied methods. When the spiking level was less than 25% of the native sample concentration, the spike recovery was not reported (**NR**) and the relative percent difference (RPD) of the MS/MSD set was not calculated (**N/C**).

In cases when either the native sample concentration was non-detectable (reported as less than or equal to the MDL) and/or the corresponding DUP result was also non-detectable, the RPD between the two values was not calculated (**N/C**).

Except for concentration qualifiers, all data were reported without qualification. All associated quality control sample results met the acceptance criteria.

BAL, an accredited laboratory, certifies that the reported results of all analyses for which BAL is NELAP accredited meet all NELAP requirements. For more information, please see the *Report Information* page.

Please feel free to contact us if you have any questions regarding this report.

Sincerely,

Jeremy Maute

Senior Project Manager

Jeremy@brooksapplied.com

Report Information

Laboratory Accreditation

BAL is accredited by the *National Environmental Laboratory Accreditation Program* (NELAP) through the State of Florida Department of Health, Bureau of Laboratories (E87982) and is certified to perform many environmental analyses. BAL is also certified by many other states to perform environmental analyses. For a current list of our accreditations/certifications, please visit our website at <http://www.brooksapplied.com/resources/certificates-permits/> or review Tables 1 and 2 in our Accreditation Information. Results reported relate only to the samples listed in the report.

Field Quality Control Samples

Please be notified that certain EPA methods require the collection of field quality control samples of an appropriate type and frequency; failure to do so is considered a deviation from some methods and for compliance purposes should only be done with the approval of regulatory authorities. Please see the specific EPA methods for details regarding required field quality control samples.

Common Abbreviations

AR	as received	MS	matrix spike
BAL	Brooks Applied Labs	MSD	matrix spike duplicate
BLK	method blank	ND	non-detect
BS	blank spike	NR	non-reportable
CAL	calibration standard	N/C	not calculated
CCB	continuing calibration blank	PS	post preparation spike
CCV	continuing calibration verification	REC	percent recovery
COC	chain of custody record	RPD	relative percent difference
D	dissolved fraction	SCV	secondary calibration verification
DUP	duplicate	SOP	standard operating procedure
IBL	instrument blank	SRM	reference material
ICV	initial calibration verification	T	total fraction
MDL	method detection limit	TR	total recoverable fraction
MRL	method reporting limit		

Definition of Data Qualifiers

(Effective 3/23/2020)

E	An estimated value due to the presence of interferences. A full explanation is presented in the narrative.
H	Holding time and/or preservation requirements not met. Please see narrative for explanation.
J	Detected by the instrument, the result is > the MDL but ≤ the MRL. Result is reported and considered an estimate.
J-1	Estimated value. A full explanation is presented in the narrative.
M	Duplicate precision (RPD) was not within acceptance criteria. Please see narrative for explanation.
N	Spike recovery was not within acceptance criteria. Please see narrative for explanation.
R	Rejected, unusable value. A full explanation is presented in the narrative.
U	Result is ≤ the MDL or client requested reporting limit (CRRL). Result reported as the MDL or CRRL.
X	Result is not BLK-corrected and is within 10x the absolute value of the highest detectable BLK in the batch. Result is estimated.
Z	Holding time and/or preservation requirements not established for this method; however, BAL recommendations for holding time were not followed. Please see narrative for explanation.

These qualifiers are based on those previously utilized by Brooks Applied Labs, those found in the EPA SOW ILM03.0, Exhibit B, Section III, pg. B-18, and the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review; USEPA; January 2010. These supersede all previous qualifiers ever employed by BAL.

Re: Regional Effects Program

Dear Mike Pope,

On September 29, 2022, Brooks Applied Labs (BAL) received six (6) aqueous samples. The samples were logged-in for total recoverable selenium [Se], dissolved Se [Se], and Se speciation analyses, according to the chain-of-custody (COC) form.

The dissolved Se fraction for *RG_ERCKBR_WS_LAEMP_EVO_2022-09_NP-NAL* (Laboratory ID = 2209376-08) arrived in a container that leaked during shipping. Some volume was spilled into the secondary containment bag, but still contained in the bag. The potential for cross contamination is low. The remaining volume left in the container was digested and analyzed for selenium. Since it is unknown if contamination occurred during shipping, the dissolved selenium result for 2209376-08 is qualified as estimated (**J-1**).

The sample fractions for total recoverable Se and dissolved Se were not preserved in the field. The samples were preserved (pH < 2) upon receipt at BAL. All sample fractions for total recoverable Se and dissolved Se were preserved within the (14 calendar day) preservation holding time.

The sample fractions logged in for Se speciation and dissolved Se had been field-filtered prior to receipt at BAL. All samples were stored according to BAL SOPs.

Total Recoverable Se and Dissolved Se

Each aqueous sample fraction for dissolved Se was digested in a closed vessel (bomb) with nitric and hydrochloric acids. The resulting digests were analyzed for Se content via inductively coupled plasma triple quadrupole mass spectrometry (ICP-QQQ-MS). The ICP-QQQ-MS instrumentation uses advanced interference removal techniques to ensure accuracy of the sample results. For more information, please visit the *Interference Reduction Technology* section on our website, brooksapplied.com.

The dissolved selenium result for 2209376-08 is qualified as estimated (**J-1**) due to a leaking container during shipping.

Selenium Speciation

Each aqueous sample was analyzed for selenium speciation using ion chromatography inductively coupled plasma collision reaction cell mass spectrometry (IC-ICP-CRC-MS). Selenium species are chromatographically separated on an ion exchange column and then quantified using inductively coupled plasma collision reaction cell mass spectrometry (ICP-CRC-MS); for more information on this determinative technique, please visit the *Interference Reduction Technology* section on our website. The chromatographic

method applied for the analyses provides greater retention of methylseleninic acid and selenomethionine, allowing for more definitive quantitation of these species.

In accordance with the quotation issued for this project, selenium speciation was defined as dissolved selenite [Se(IV)], selenate [Se(VI)], selenocyanate [SeCN], methylseleninic acid [MeSe(IV)], methaneselenonic acid [MeSe(VI)], selenomethionine [SeMet], selenosulfate [SeSO₃], and dimethylselenoxide [DMSeO]. Unknown Se species was defined as the total concentration of all unknown Se species observed during the analysis. This item is identified on the report as [Unk Se Sp].

DMSeO elutes early in the chromatographic run due to the nature of the molecule and the applied chromatographic separation method. Since this species elutes near the dead volume, additional selenium species may coelute. Alternate methods can be applied, upon client request, to increase the separation of DMSeO from potentially co-eluting selenium species.

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

In instances where a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample concentration, the recoveries and the relative percent difference (RPD) are not considered valid indicators of data quality. In such instances, the recoveries of the laboratory fortified blanks (BS) and/or standard reference materials (SRM) demonstrate the accuracy of the applied methods. When the spiking level was less than 25% of the native sample concentration, the spike recovery was not reported (**NR**) and the relative percent difference (RPD) of the MS/MSD set was not calculated (**N/C**).

In cases when either the native sample concentration was non-detectable (reported as less than or equal to the MDL) and/or the corresponding DUP result was also non-detectable, the RPD between the two values was not calculated (**N/C**).

Except for concentration qualifiers and the item noted above (container leaking during shipping), all data were reported without qualification. All associated quality control sample results met the acceptance criteria.

BAL, an accredited laboratory, certifies that the reported results of all analyses for which BAL is NELAP accredited meet all NELAP requirements. For more information, please see the *Report Information* page.

Please feel free to contact us if you have any questions regarding this report.

Sincerely,

Jeremy Maute

Senior Project Manager

Jeremy@brooksapplied.com

Report Information

Laboratory Accreditation

BAL is accredited by the *National Environmental Laboratory Accreditation Program* (NELAP) through the State of Florida Department of Health, Bureau of Laboratories (E87982) and is certified to perform many environmental analyses. BAL is also certified by many other states to perform environmental analyses. For a current list of our accreditations/certifications, please visit our website at <http://www.brooksapplied.com/resources/certificates-permits/> or review Tables 1 and 2 in our Accreditation Information. Results reported relate only to the samples listed in the report.

Field Quality Control Samples

Please be notified that certain EPA methods require the collection of field quality control samples of an appropriate type and frequency; failure to do so is considered a deviation from some methods and for compliance purposes should only be done with the approval of regulatory authorities. Please see the specific EPA methods for details regarding required field quality control samples.

Definition of Data Qualifiers

(Effective 3/23/2020)

E	An estimated value due to the presence of interferences. A full explanation is presented in the narrative.
H	Holding time and/or preservation requirements not met. Please see narrative for explanation.
J	Detected by the instrument, the result is > the MDL but ≤ the MRL. Result is reported and considered an estimate.
J-1	Estimated value. A full explanation is presented in the narrative.
M	Duplicate precision (RPD) was not within acceptance criteria. Please see narrative for explanation.
N	Spike recovery was not within acceptance criteria. Please see narrative for explanation.
R	Rejected, unusable value. A full explanation is presented in the narrative.
U	Result is ≤ the MDL or client requested reporting limit (CRRL). Result reported as the MDL or CRRL.
X	Result is not BLK-corrected and is within 10x the absolute value of the highest detectable BLK in the batch. Result is estimated.
Z	Holding time and/or preservation requirements not established for this method; however, BAL recommendations for holding time were not followed. Please see narrative for explanation.

These qualifiers are based on those previously utilized by Brooks Applied Labs, those found in the EPA SOW ILM03.0, Exhibit B, Section III, pg. B-18, and the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review; USEPA; January 2010. These supersede all previous qualifiers ever employed by BAL.

Accreditation Information

Table 1. Accredited method/matrix/analytes for TNI
Issued by: State of Florida Dept. of Health (The NELAC Institute 2016 Standard)
Issued on: July 1, 2021; Valid to: June 30, 2022
Certificate Number: E87982-37

Method	Matrix	TNI Accredited Analyte(s)
EPA 1638	Non-Potable Waters	Ag, Cd, Cu, Ni, Pb, Sb, Se, Ti, Zn

Re: Regional Effects Program

Dear Mike Pope,

On November 10, 2022, Brooks Applied Labs (BAL) received sixty-four (64) aqueous samples. The samples were logged-in for total recoverable selenium [Se], dissolved Se [Se], and Se speciation analyses, according to the chain-of-custody (COC) forms.

Date/Time Collected values listed on the chain-of-custody (COC) forms did not exactly match the corresponding **Date/Time Collected** values on the container labels for 2211127-76, 2211127-77, 2211127-82, and 2211127-83. The discrepancies are described in the table below.

Date/Time Collected Discrepancies

Laboratory ID	Sample ID	Date/Time Collected (on COC form)	Date/Time Collected (on container label)
2211127-76	RG_ALUSM_WS_LAEMP_EVO_2022-11_NP-NAL	11/03/2022 14:00	11/03/2022 14:30
2211127-77	RG_ALUSM_WS_LAEMP_EVO_2022-11_NP-NAL	11/03/2022 14:00	11/03/2022 14:30
2211127-82	RG_FBLANK2_WS_LAEMP_EVO_2022-11_NP-NAL	11/03/2022 09:00	11/03/2022 11:00
2211127-83	RG_FBLANK2_WS_LAEMP_EVO_2022-11_NP-NAL	11/03/2022 09:00	11/03/2022 11:00

Per client request, samples 2211127-76, 2211127-77, 2211127-82, and 2211127-83 were logged in and reported using the **Date/Time Collected** values listed on the COC form (*column 3 in the table above*).

Chain-of-custody (COC) forms were received with the sample shipment and the laboratory documented receipt of the samples on these COC forms. Revised COC forms (*for COC pages 2, 3, and 4*) were subsequently provided via email. Per client request, BAL was instructed to use the corrected **Date/Time Collected** values (on the revised COC forms) for reporting. Please see the revised COC forms at the end of this report. The cases where changes to **Date/Time Collected** values were requested are highlighted in

yellow on the revised COC forms. In order to document custody, both sets of COC forms are included in this report.

The container labels for 2211127-02 and 2211127-20 both listed the following information: (*RG_ERCKDT_1_PW-2_2022-10_N, 10/31/2022 08:45*), which describes the information on the COC forms that corresponds to 2211127-02. A container for (*RG_ERCKUT_1_PW-2_2022-10_N, 10/31/2022 13:15*), which describes the information on the COC forms that corresponds to 2211127-20, was not received. Per client request, the *RG_ERCKDT_1_PW-2_2022-10_N, 10/31/2022 08:45* was assigned to 2211127-20 and sample 2211127-02 was assigned to (*RG_ERCKUT_1_PW-2_2022-10_N, 10/31/2022 13:15*).

The dissolved fraction for *RG_RIVER_WS_LAEMP_EVO_2022-11_NP-NAL* (Laboratory ID = 2211127-46) arrived in a container that leaked during shipping. The entire sample volume for 2211127-46 was lost. A fraction of the corresponding unfiltered, total recoverable Se fraction (laboratory ID: 2211127-47) was filtered (0.45 μm) into a new container to support the dissolved Se analysis for *RG_RIVER_WS_LAEMP_EVO_2022-11_NP-NAL*. This new dissolved Se fraction was preserved (pH < 2) by BAL staff at the time of receipt and logged in under 2211127-46. The filtration for 2211127-46 took place beyond the (2-calander day) filtration holding time. Consequently, the dissolved Se result for 2211127-46 is qualified (**H**) for a filtration holding time violation.

The sample fractions for total recoverable Se and dissolved Se were not preserved in the field. The samples were preserved (pH < 2) upon receipt at BAL. All sample fractions for total recoverable Se and dissolved Se were preserved within the (14 calendar day) preservation holding time.

The sample fractions logged in for Se speciation and dissolved Se had been field-filtered prior to receipt at BAL. All samples were stored according to BAL SOPs.

Total Recoverable Se and Dissolved Se

Each aqueous sample fraction for dissolved Se was digested in a closed vessel (bomb) with nitric and hydrochloric acids. The resulting digests were analyzed for Se content via inductively coupled plasma triple quadrupole mass spectrometry (ICP-QQQ-MS). The ICP-QQQ-MS instrumentation uses advanced interference removal techniques to ensure accuracy of the sample results. For more information, please visit the *Interference Reduction Technology* section on our website, brooksapplied.com.

The dissolved Se result for 2211127-46 is qualified (**H**) for filtration beyond the (2-calander day) filtration holding time.

Selenium Speciation

Each aqueous sample was analyzed for selenium speciation using ion chromatography inductively coupled plasma collision reaction cell mass spectrometry (IC-ICP-CRC-MS). Selenium species are chromatographically separated on an ion exchange column and then quantified using inductively coupled plasma collision reaction cell mass spectrometry (ICP-CRC-MS); for more information on this determinative technique, please visit the *Interference Reduction Technology* section on our website. The chromatographic method applied for the analyses provides greater retention of methylseleninic acid and selenomethionine, allowing for more definitive quantitation of these species.

In accordance with the quotation issued for this project, selenium speciation was defined as dissolved selenite [Se(IV)], selenate [Se(VI)], selenocyanate [SeCN], methylseleninic acid [MeSe(IV)], methaneselenonic acid [MeSe(VI)], selenomethionine [SeMef], selenosulfate [SeSO₃], and dimethylselenoxide [DMSeO]. Unknown Se species was defined as the total concentration of all unknown Se species observed during the analysis. This item is identified in the report as [Unk Se Sp].

DMSeO elutes early in the chromatographic run due to the nature of the molecule and the applied chromatographic separation method. Since this species elutes near the dead volume, additional selenium species may coelute. Alternate methods can be applied, upon client request, to increase the separation of DMSeO from potentially co-eluting selenium species.

Poor mass balance was observed in *RG_RIVER_WS_LAEMP_EVO_2022-11_N* when the sum of Se species (in sample 2211127-45) were compared to the corresponding dissolved Se result (2211127-46). Container labels were inspected and there was no indication that samples had been mis-labeled. Re-analyses confirmed the results for 2211127-45, 2211127-46, and 2211127-47. Consequently, no additional corrective actions are necessary. Results for these samples are reported from initial injections, and the reported results are deemed representative of the submitted containers.

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

In instances where a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample concentration, the recoveries and the relative percent difference (RPD) are not considered valid indicators of data quality. In such instances, the recoveries of the laboratory fortified blanks (BS) and/or standard reference materials (SRM) demonstrate the accuracy of the applied methods. When the spiking level was less than 25% of the native sample concentration, the spike recovery was not reported (**NR**) and the relative percent difference (RPD) of the MS/MSD set was not calculated (**N/C**).

In cases when either the native sample concentration was non-detectable (reported as less than or equal to the MDL) and/or the corresponding DUP result was also non-detectable, the RPD between the two values was not calculated (**N/C**).

Except for concentration qualifiers and items noted above, all data were reported without qualification. All associated quality control sample results met the acceptance criteria.

BAL verifies that the reported results of all analyses for which the laboratory is accredited meet the requirements of the accrediting body, unless otherwise noted in the report narrative. For more information regarding accreditations please see the *Report Information* and *Batch Summary* pages. This report must be used in its entirety for interpretation of results.

Please feel free to contact us if you have any questions regarding this report.

Sincerely,

A handwritten signature in black ink, appearing to read 'Jeremy Maute', with a stylized flourish at the end.

Jeremy Maute

Senior Project Manager

Report Information

General Disclaimers

Test results are based solely upon the sample submitted to Brooks Applied Labs in the condition it was received. This report shall not be reproduced or copied, except in full, without written approval of the laboratory. Brooks Applied Labs is not responsible for the consequences arising from the use of a partial report.

Laboratory Accreditation

BAL maintains accreditation with various state and national agencies for select test methods. For a current list of BAL accreditations, please visit our website at <http://www.brooksapplied.com/resources/certificates-permits/>. The reported analyte/matrix/method combination shall be considered outside BAL's scopes of accreditation unless otherwise identified as ISO, TNI, or ISO,TNI in the tables. It is the responsibility of the client to verify whether a specific accreditation is required for the intended data use.

ISO: ISO/IEC 17025:2017 accredited test method. Issued by ANSI National Accreditation Board (ANAB), #ADE-1447.02

TNI: NELAP accredited test method. Issued by the State of Florida Department of Health, #E87982.

ISO,TNI: Test method is accredited under both the ISO/IEC 17025:2017 and NELAP accreditations referenced above.

Field Quality Control Samples

Please be notified that certain EPA methods require the collection of field quality control samples of an appropriate type and frequency; failure to do so is considered a deviation from some methods and for compliance purposes should only be done with the approval of regulatory authorities. Please see the specific EPA methods for details regarding required field quality control samples.

Definition of Data Qualifiers

E	An estimated value due to the presence of interferences. A full explanation is presented in the narrative.
H	Holding time and/or preservation requirements not met. Please see narrative for explanation.
J	Detected by the instrument, the result is > the MDL but ≤ the MRL. Result is reported and considered an estimate.
J-1	Estimated value. A full explanation is presented in the narrative.
M	Duplicate precision (RPD) was not within acceptance criteria. Please see narrative for explanation.
N	Spike recovery was not within acceptance criteria. Please see narrative for explanation.
R	Rejected, unusable value. A full explanation is presented in the narrative.
U	Result is ≤ the MDL or client requested reporting limit (CRRL). Result reported as the MDL or CRRL.
X	Result is not BLK-corrected and is within 10x the absolute value of the highest detectable BLK in the batch. Result is estimated.
Z	Holding time and/or preservation requirements not established for this method; however, BAL recommendations for holding time were not followed. Please see narrative for explanation.

Hi Jeremy!

First, thank you for being patient with our mislabeling!

I have looked at the results please name the samples as follows:

2211127-02 RG_ERCKUT_1_PW-2_2022-10_N

2211127-20 RG_ERCKDT_1_PW-2_2022-10_N

These can all be submitted in the same lab file now.

Thanks!!

Robin

Subject: Brooks Preliminary Report/EDD, WO 2211127: Regional Effects Program, REP Project - Confidential

Attached are the [preliminary report and EDD](#) for COC ID **EVO LAEMP NOV 2022**, associated with the REP Project.

Poor mass balance was observed in *RG_RIVER_WS_LAEMP_EVO_2022-11_N* when the sum of Se species (in sample 2211127-45) were compared to the corresponding dissolved Se result (2211127-46). Some confirmation analyses have been completed. The speciation profile in 2211127-45 looks like a *RG_RIVER_WS* sample, but the mass balance with the dissolved Se fraction is off. Additional confirmation analyses are underway. Consequently, the results in the attached report are only preliminary. Once the confirmation analyses are completed, a final report will be issued. In the final report, results may change for some samples (*potentially 2211127-45 or 2211127-46*) depending on the findings in the re-analyses.

Date/Time Collected values listed on the chain-of-custody (COC) forms did not exactly match the corresponding **Date/Time Collected** values on the container labels for 2211127-76, 2211127-77, 2211127-82, and 2211127-83. The discrepancies are described in the table below.

Date/Time Collected Discrepancies

Laboratory ID	Sample ID	Date/Time Collected (on COC form)	Date/Time Collected (on container label)
2211127-76	RG_ALUSM_WS_LAEMP_EVO_2022-11_NP-NAL	11/03/2022 14:00	11/03/2022 14:30
2211127-77	RG_ALUSM_WS_LAEMP_EVO_2022-11_NP-NAL	11/03/2022 14:00	11/03/2022 14:30
2211127-82	RG_FBLANK2_WS_LAEMP_EVO_2022-11_NP-NAL	11/03/2022 09:00	11/03/2022 11:00
2211127-83	RG_FBLANK2_WS_LAEMP_EVO_2022-11_NP-NAL	11/03/2022 09:00	11/03/2022 11:00

Per request, samples 2211127-76, 2211127-77, 2211127-82, and 2211127-83 were logged in and reported using the **Date/Time Collected** values listed on the COC form (*column 3 in the table above*).

Chain-of-custody (COC) forms were received with the sample shipment and the laboratory documented receipt of the samples on these COC forms. Revised COC forms (*for COC pages 2, 3, and 4*) were subsequently provided via email. Per client request, BAL was instructed to use the corrected **Date/Time Collected** values (on the revised COC forms) for reporting. Please see the revised COC forms at the end of this report. The cases where changes to **Date/Time Collected** values were requested are highlighted in yellow on the revised COC forms. In order to document custody, both sets of COC forms are included in this report.

The container labels for 2211127-02 and 2211127-20 both listed the following information: (*RG_ERCKDT_1_PW-2_2022-10_N, 10/31/2022 08:45*). This describes the information on the COC forms that corresponds to 2211127-02. A container for *RG_ERCKUT_1_PW-2_2022-10_N, 10/31/2022 13:15*, which describes the information on the COC forms that corresponds to 2211127-20, was not received. The two fractions labeled *RG_ERCKDT_1_PW-2_2022-10_N, 10/31/2022 08:45* were logged in under 2211127-02 and 2211127-20. AT this time, it is unclear if the field ID assignments are correct for 2211127-02 and 2211127-20.

The dissolved fraction for *RG_RIVER_WS_LAEMP_EVO_2022-11_NP-NAL* (Laboratory ID = 2211127-46) arrived in a container that leaked during shipping. The entire sample volume for 2211127-46 was lost. A fraction of the corresponding unfiltered, total recoverable Se fraction (laboratory ID: 2211127-47) was filtered (0.45 µm) into a new container to support the dissolved Se analysis for *RG_RIVER_WS_LAEMP_EVO_2022-11_NP-NAL*. This new dissolved Se fraction was preserved (pH < 2) by BAL staff at the time of receipt and logged in under 2211127-46. The filtration for 2211127-46 took place beyond the (2-calendar day) filtration holding time. Consequently, the dissolved Se result for 2211127-46 is qualified (**H**) for a filtration holding time violation.

The sample fractions for total recoverable Se and dissolved Se were not preserved in the field. The samples were preserved (pH < 2) upon receipt at BAL. All sample fractions for total recoverable Se and dissolved Se were preserved within the (14 calendar day) preservation holding time.

As always, please contact us if there are any questions about this data.

Regards,

Jeremy Maute

Re: Regional Effects Program

Dear Mike Pope,

On December 9, 2022, Brooks Applied Labs (BAL) received thirty-four (34) aqueous samples. The samples were logged-in for total recoverable selenium [Se], dissolved Se [Se], and Se speciation analyses, according to the chain-of-custody (COC) forms.

The **Date/Time Collected** value listed on the chain-of-custody (COC) forms did not exactly match the corresponding **Date/Time Collected** value on the container label for 2212161-13. The discrepancy is described in the table below.

Date/Time Collected Discrepancies

Laboratory ID	Sample ID	Date/Time Collected (on COC form)	Date/Time Collected (on container label)
2212161-13	RG_GATEDP_WS_LAEMP_EVO_2022-12_N	11/29/2022 13:30	11/29/2022 14:30

Per client request, 2212161-13 was logged in and reported using the **Date/Time Collected** value listed on the COC form (*column 3 in the table above*).

The dissolved selenium fraction for *RG_FBLANK_WS_LAEMP_EVO_2022-12_NP-NAL* (Laboratory ID = 2212161-29) arrived in a container that leaked during shipping. The entire volume of the sample was lost. An aliquot from the corresponding Se speciation fraction (Laboratory ID = 2212161-28) was poured off to recreate the dissolved selenium fraction for 2212161-29.

Sample ID values provided on the chain-of-custody (COC) forms did not exactly match the corresponding **Sample ID** values listed on container labels for several samples. The discrepancies are described in the table below.

Sample ID Agreement Issues

Laboratory ID	Sample ID (On COC form)	Sample ID (On container label)

2212161-40	RG_ERCKUC_WS_LAEMP_EVO_2022-12_N	RG_ERCKUC_WS_LAEMP_EVO_2022-11-30_N
2212161-41 / 2212161-42	RG_ERCKUC_WS_LAEMP_EVO_2022-12_NP-NAL	RG_ERCKUC_WS_LAEMP_EVO_2022-11-30_NP-NAL

BAL was instructed to use the **Sample ID** values on the COC form (*column 2 in the table above*) for reporting.

The sample fractions for total recoverable Se and dissolved Se were not preserved in the field. The samples were preserved (pH < 2) upon receipt at BAL. All sample fractions for total recoverable Se and dissolved Se were preserved within the (14 calendar day) preservation holding time.

The sample fractions logged in for Se speciation and dissolved Se had been field-filtered prior to receipt at BAL. All samples were stored according to BAL SOPs.

Total Recoverable Se and Dissolved Se

Each aqueous sample fraction for dissolved Se was digested in a closed vessel (bomb) with nitric and hydrochloric acids. The resulting digests were analyzed for Se content via inductively coupled plasma triple quadrupole mass spectrometry (ICP-QQQ-MS). The ICP-QQQ-MS instrumentation uses advanced interference removal techniques to ensure accuracy of the sample results. For more information, please visit the *Interference Reduction Technology* section on our website, brooksapplied.com.

Selenium Speciation

Each aqueous sample was analyzed for selenium speciation using ion chromatography inductively coupled plasma collision reaction cell mass spectrometry (IC-ICP-CRC-MS). Selenium species are chromatographically separated on an ion exchange column and then quantified using inductively coupled plasma collision reaction cell mass spectrometry (ICP-CRC-MS); for more information on this determinative technique, please visit the *Interference Reduction Technology* section on our website. The chromatographic method applied for the analyses provides greater retention of methylseleninic acid and selenomethionine, allowing for more definitive quantitation of these species.

In accordance with the quotation issued for this project, selenium speciation was defined as dissolved selenite [Se(IV)], selenate [Se(VI)], selenocyanate [SeCM], methylseleninic acid [MeSe(IV)], methaneselenonic acid [MeSe(VI)], selenomethionine [SeMet], selenosulfate [SeSO₃], and dimethylselenoxide [DMSeO]. Unknown Se species was defined as the total concentration of all unknown Se species observed during the analysis. This item is identified in the report as [Unk Se Sp].

DMSeO elutes early in the chromatographic run due to the nature of the molecule and the applied chromatographic separation method. Since this species elutes near the dead volume, additional selenium species may coelute. Alternate methods can be applied, upon client request, to increase the separation of DMSeO from potentially co-eluting selenium species.

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

In instances where a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample concentration, the recoveries and the relative percent difference (RPD) are not considered valid indicators of data quality. In such instances, the recoveries of the laboratory fortified blanks (BS) and/or standard reference materials (SRM) demonstrate the accuracy of the applied methods. When the spiking level was less than 25% of the native sample concentration, the spike recovery was not reported (**NR**) and the relative percent difference (RPD) of the MS/MSD set was not calculated (**N/C**).

In cases when either the native sample concentration was non-detectable (reported as less than or equal to the MDL) and/or the corresponding DUP result was also non-detectable, the RPD between the two values was not calculated (**N/C**).

Except for concentration qualifiers, all data were reported without qualification. All associated quality control sample results met the acceptance criteria.

BAL verifies that the reported results of all analyses for which the laboratory is accredited meet the requirements of the accrediting body, unless otherwise noted in the report narrative. For more information regarding accreditations please see the *Report Information* and *Batch Summary* pages. This report must be used in its entirety for interpretation of results.

Please feel free to contact us if you have any questions regarding this report.

Sincerely,

A handwritten signature in black ink, appearing to read 'Jeremy Maute', with a stylized flourish at the end.

Jeremy Maute

Senior Project Manager

Report Information

General Disclaimers

Test results are based solely upon the sample submitted to Brooks Applied Labs in the condition it was received. This report shall not be reproduced or copied, except in full, without written approval of the laboratory. Brooks Applied Labs is not responsible for the consequences arising from the use of a partial report.

Laboratory Accreditation

BAL maintains accreditation with various state and national agencies for select test methods. For a current list of BAL accreditations, please visit our website at <http://www.brooksapplied.com/resources/certificates-permits/>. The reported analyte/matrix/method combination shall be considered outside BAL's scopes of accreditation unless otherwise identified as ISO, TNI, or ISO,TNI in the tables. It is the responsibility of the client to verify whether a specific accreditation is required for the intended data use.

ISO: ISO/IEC 17025:2017 accredited test method. Issued by ANSI National Accreditation Board (ANAB), #ADE-1447.02

TNI: NELAP accredited test method. Issued by the State of Florida Department of Health, #E87982.

ISO,TNI: Test method is accredited under both the ISO/IEC 17025:2017 and NELAP accreditations referenced above.

Field Quality Control Samples

Please be notified that certain EPA methods require the collection of field quality control samples of an appropriate type and frequency; failure to do so is considered a deviation from some methods and for compliance purposes should only be done with the approval of regulatory authorities. Please see the specific EPA methods for details regarding required field quality control samples.

Common Abbreviations

AR	as received	MS	matrix spike
BAL	Brooks Applied Labs	MSD	matrix spike duplicate
BLK	method blank	ND	non-detect
BS	blank spike	NR	non-reportable
CAL	calibration standard	N/C	not calculated
CCB	continuing calibration blank	PS	post preparation spike
CCV	continuing calibration verification	REC	percent recovery
COC	chain of custody record	RPD	relative percent difference
D	dissolved fraction	SCV	secondary calibration verification
DUP	duplicate	SOP	standard operating procedure
IBL	instrument blank	SRM	reference material
ICV	initial calibration verification	T	total fraction
MDL	method detection limit	TR	total recoverable fraction
MRL	method reporting limit		

Definition of Data Qualifiers

E	An estimated value due to the presence of interferences. A full explanation is presented in the narrative.
H	Holding time and/or preservation requirements not met. Please see narrative for explanation.
J	Detected by the instrument, the result is > the MDL but ≤ the MRL. Result is reported and considered an estimate.
J-1	Estimated value. A full explanation is presented in the narrative.
M	Duplicate precision (RPD) was not within acceptance criteria. Please see narrative for explanation.
N	Spike recovery was not within acceptance criteria. Please see narrative for explanation.
R	Rejected, unusable value. A full explanation is presented in the narrative.
U	Result is ≤ the MDL or client requested reporting limit (CRRL). Result reported as the MDL or CRRL.
X	Result is not BLK-corrected and is within 10x the absolute value of the highest detectable BLK in the batch. Result is estimated.
Z	Holding time and/or preservation requirements not established for this method; however, BAL recommendations for holding time were not followed. Please see narrative for explanation.

NOTICE OF CLAIM: No carrier is liable for loss, damage or delay of any goods under the Bill of Lading unless notice, in writing, is given to the originating carrier or the delivering carrier within sixty (60) days after the delivery of the goods or the estimated amount claimed, whichever is later. A statement of the claim must be filed within nine (9) months from the date of shipment, together with a copy of the paid freight bill RECEIVED at the point of origin or the date specified from the consignee mentioned herein. The property herein described, in apparent good order, except as noted, contents and condition of contents of package unknown, marked, consigned and destined as indicated below, which the carrier agrees to carry and to deliver to the consignee at the said destination, subject to the rates and classification in effect on the date of shipment. It is mutually agreed, as to each carrier of all or any of the goods over all or any portion of the route to destination, and as to each party of any time interested in all or any of the goods, that every service to be performed hereunder shall be subject to the conditions set forth in the Bill of Lading, in power at the date of issuing, which are hereto agreed by the shipper and accepted for himself and his assigns. Printed or written, including conditions set aside by the standard Bill of Lading in power at the date of issuing, which are hereby agreed by the consignee and accepted for himself and his assigns. The Contract for the carriage of the goods listed in the Bill of Lading is governed by regulation in force in the jurisdiction at the time and place of shipment and is subject to the conditions set out in such conditions.

Re: Regional Effects Program

Dear Mike Pope,

On June 2, 2022, Brooks Applied Labs (BAL) received nine (9) aqueous samples. The samples were logged-in for Se speciation analyses, according to the chain-of-custody (COC) form.

The sample fractions logged in for Se speciation had been field-filtered prior to receipt at BAL. All samples were stored according to BAL SOPs.

Selenium Speciation

Each aqueous sample was analyzed for selenium speciation using ion chromatography inductively coupled plasma collision reaction cell mass spectrometry (IC-ICP-CRC-MS). Selenium species are chromatographically separated on an ion exchange column and then quantified using inductively coupled plasma collision reaction cell mass spectrometry (ICP-CRC-MS); for more information on this determinative technique, please visit the *Interference Reduction Technology* section on our website. The chromatographic method applied for the analyses provides greater retention of methylseleninic acid and selenomethionine, allowing for more definitive quantitation of these species.

In accordance with the quotation issued for this project, selenium speciation was defined as dissolved selenite [Se(IV)], selenate [Se(VI)], selenocyanate [SeCN], methylseleninic acid [MeSe(IV)], methaneselenonic acid [MeSe(VI)], selenomethionine [SeMet], selenosulfate [SeSO₃], and dimethylselenoxide [DMSeO]. Unknown Se species was defined as the total concentration of all unknown Se species observed during the analysis. This item is identified on the report as [Unk Se Sp].

DMSeO elutes early in the chromatographic run due to the nature of the molecule and the applied chromatographic separation method. Since this species elutes near the dead volume, additional selenium species may coelute. Alternate methods can be applied, upon client request, to increase the separation of DMSeO from potentially co-eluting selenium species.

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

In instances where a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample concentration, the recoveries and the relative percent difference (RPD) are not considered valid indicators of data quality. In such instances, the recoveries of the laboratory fortified blanks (BS) and/or standard reference materials (SRM) demonstrate the accuracy of the applied methods. When the spiking

level was less than 25% of the native sample concentration, the spike recovery was not reported (**NR**) and the relative percent difference (RPD) of the MS/MSD set was not calculated (**N/C**).

In cases when either the native sample concentration was non-detectable (reported as less than or equal to the MDL) and/or the corresponding DUP result was also non-detectable, the RPD between the two values was not calculated (**N/C**).

Except for concentration qualifiers, all data were reported without qualification. All associated quality control sample results met the acceptance criteria.

BAL, an accredited laboratory, certifies that the reported results of all analyses for which BAL is NELAP accredited meet all NELAP requirements. For more information, please see the *Report Information* page.

Please feel free to contact us if you have any questions regarding this report.

Sincerely,

A handwritten signature in black ink, appearing to read 'Jeremy Maute', written in a cursive style.

Jeremy Maute
Senior Project Manager
Jeremy@brooksapplied.com

Report Information

Laboratory Accreditation

BAL is accredited by the *National Environmental Laboratory Accreditation Program* (NELAP) through the State of Florida Department of Health, Bureau of Laboratories (E87982) and is certified to perform many environmental analyses. BAL is also certified by many other states to perform environmental analyses. For a current list of our accreditations/certifications, please visit our website at <http://www.brooksapplied.com/resources/certificates-permits/> or review Tables 1 and 2 in our Accreditation Information. Results reported relate only to the samples listed in the report.

Field Quality Control Samples

Please be notified that certain EPA methods require the collection of field quality control samples of an appropriate type and frequency; failure to do so is considered a deviation from some methods and for compliance purposes should only be done with the approval of regulatory authorities. Please see the specific EPA methods for details regarding required field quality control samples.

Common Abbreviations

AR	as received	MS	matrix spike
BAL	Brooks Applied Labs	MSD	matrix spike duplicate
BLK	method blank	ND	non-detect
BS	blank spike	NR	non-reportable
CAL	calibration standard	N/C	not calculated
CCB	continuing calibration blank	PS	post preparation spike
CCV	continuing calibration verification	REC	percent recovery
COC	chain of custody record	RPD	relative percent difference
D	dissolved fraction	SCV	secondary calibration verification
DUP	duplicate	SOP	standard operating procedure
IBL	instrument blank	SRM	reference material
ICV	initial calibration verification	T	total fraction
MDL	method detection limit	TR	total recoverable fraction
MRL	method reporting limit		

Definition of Data Qualifiers

(Effective 3/23/2020)

E	An estimated value due to the presence of interferences. A full explanation is presented in the narrative.
H	Holding time and/or preservation requirements not met. Please see narrative for explanation.
J	Detected by the instrument, the result is > the MDL but ≤ the MRL. Result is reported and considered an estimate.
J-1	Estimated value. A full explanation is presented in the narrative.
M	Duplicate precision (RPD) was not within acceptance criteria. Please see narrative for explanation.
N	Spike recovery was not within acceptance criteria. Please see narrative for explanation.
R	Rejected, unusable value. A full explanation is presented in the narrative.
U	Result is ≤ the MDL or client requested reporting limit (CRRL). Result reported as the MDL or CRRL.
X	Result is not BLK-corrected and is within 10x the absolute value of the highest detectable BLK in the batch. Result is estimated.
Z	Holding time and/or preservation requirements not established for this method; however, BAL recommendations for holding time were not followed. Please see narrative for explanation.

These qualifiers are based on those previously utilized by Brooks Applied Labs, those found in the EPA SOW ILM03.0, Exhibit B, Section III, pg. B-18, and the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review; USEPA; January 2010. These supersede all previous qualifiers ever employed by BAL.

Re: Regional Effects Program

Dear Mike Pope,

On June 2, 2022, Brooks Applied Labs (BAL) received nine (9) aqueous samples. The samples were logged-in for Se speciation analyses, according to the chain-of-custody (COC) form.

The sample fractions logged in for Se speciation had been field-filtered prior to receipt at BAL. All samples were stored according to BAL SOPs.

Selenium Speciation

Each aqueous sample was analyzed for selenium speciation using ion chromatography inductively coupled plasma collision reaction cell mass spectrometry (IC-ICP-CRC-MS). Selenium species are chromatographically separated on an ion exchange column and then quantified using inductively coupled plasma collision reaction cell mass spectrometry (ICP-CRC-MS); for more information on this determinative technique, please visit the *Interference Reduction Technology* section on our website. The chromatographic method applied for the analyses provides greater retention of methylseleninic acid and selenomethionine, allowing for more definitive quantitation of these species.

In accordance with the quotation issued for this project, selenium speciation was defined as dissolved selenite [Se(IV)], selenate [Se(VI)], selenocyanate [SeCN], methylseleninic acid [MeSe(IV)], methaneselenonic acid [MeSe(VI)], selenomethionine [SeMet], selenosulfate [SeSO₃], and dimethylselenoxide [DMSeO]. Unknown Se species was defined as the total concentration of all unknown Se species observed during the analysis. This item is identified on the report as [Unk Se Sp].

DMSeO elutes early in the chromatographic run due to the nature of the molecule and the applied chromatographic separation method. Since this species elutes near the dead volume, additional selenium species may coelute. Alternate methods can be applied, upon client request, to increase the separation of DMSeO from potentially co-eluting selenium species.

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

In instances where a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample concentration, the recoveries and the relative percent difference (RPD) are not considered valid indicators of data quality. In such instances, the recoveries of the laboratory fortified blanks (BS) and/or standard reference materials (SRM) demonstrate the accuracy of the applied methods. When the spiking

level was less than 25% of the native sample concentration, the spike recovery was not reported (**NR**) and the relative percent difference (RPD) of the MS/MSD set was not calculated (**N/C**).

In cases when either the native sample concentration was non-detectable (reported as less than or equal to the MDL) and/or the corresponding DUP result was also non-detectable, the RPD between the two values was not calculated (**N/C**).

Except for concentration qualifiers, all data were reported without qualification. All associated quality control sample results met the acceptance criteria.

BAL, an accredited laboratory, certifies that the reported results of all analyses for which BAL is NELAP accredited meet all NELAP requirements. For more information, please see the *Report Information* page.

Please feel free to contact us if you have any questions regarding this report.

Sincerely,

A handwritten signature in black ink, appearing to read 'Jeremy Maute', is positioned above the typed name.

Jeremy Maute

Report Information

Laboratory Accreditation

BAL is accredited by the *National Environmental Laboratory Accreditation Program* (NELAP) through the State of Florida Department of Health, Bureau of Laboratories (E87982) and is certified to perform many environmental analyses. BAL is also certified by many other states to perform environmental analyses. For a current list of our accreditations/certifications, please visit our website at <http://www.brooksapplied.com/resources/certificates-permits/> or review Tables 1 and 2 in our Accreditation Information. Results reported relate only to the samples listed in the report.

Field Quality Control Samples

Please be notified that certain EPA methods require the collection of field quality control samples of an appropriate type and frequency; failure to do so is considered a deviation from some methods and for compliance purposes should only be done with the approval of regulatory authorities. Please see the specific EPA methods for details regarding required field quality control samples.

Common Abbreviations

AR	as received	MS	matrix spike
BAL	Brooks Applied Labs	MSD	matrix spike duplicate
BLK	method blank	ND	non-detect
BS	blank spike	NR	non-reportable
CAL	calibration standard	N/C	not calculated
CCB	continuing calibration blank	PS	post preparation spike
CCV	continuing calibration verification	REC	percent recovery
COC	chain of custody record	RPD	relative percent difference
D	dissolved fraction	SCV	secondary calibration verification
DUP	duplicate	SOP	standard operating procedure
IBL	instrument blank	SRM	reference material
ICV	initial calibration verification	T	total fraction
MDL	method detection limit	TR	total recoverable fraction
MRL	method reporting limit		

Definition of Data Qualifiers

(Effective 3/23/2020)

E	An estimated value due to the presence of interferences. A full explanation is presented in the narrative.
H	Holding time and/or preservation requirements not met. Please see narrative for explanation.
J	Detected by the instrument, the result is > the MDL but ≤ the MRL. Result is reported and considered an estimate.
J-1	Estimated value. A full explanation is presented in the narrative.
M	Duplicate precision (RPD) was not within acceptance criteria. Please see narrative for explanation.
N	Spike recovery was not within acceptance criteria. Please see narrative for explanation.
R	Rejected, unusable value. A full explanation is presented in the narrative.
U	Result is ≤ the MDL or client requested reporting limit (CRRL). Result reported as the MDL or CRRL.
X	Result is not BLK-corrected and is within 10x the absolute value of the highest detectable BLK in the batch. Result is estimated.
Z	Holding time and/or preservation requirements not established for this method; however, BAL recommendations for holding time were not followed. Please see narrative for explanation.

These qualifiers are based on those previously utilized by Brooks Applied Labs, those found in the EPA SOW ILM03.0, Exhibit B, Section III, pg. B-18, and the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review; USEPA; January 2010. These supersede all previous qualifiers ever employed by BAL.

Re: Regional EVO LAEMP

Revision 1

Following the submission of the original report on September 22, 2022, 2022, it was determined that **Sample ID** value for 2208261-24 was incorrect. Per client request, the Sample ID value for 2208261-24 has been changed from "RG_ERCKMD_3_PW-2_2022-08_N" to "RG_ERCKMD_3_PW-1_2022-08_N" for reporting. The **Sample ID** value "RG_ERCKMD_3_PW-1_2022-08_N" was listed on the container label for 2208261-24. No other changes were made, with respect to the original report issued on September 22, 2022.

Dear Mike Pope,

On August 18, 2022, Brooks Applied Labs (BAL) received twenty-seven (27) aqueous samples. The samples were logged-in for Se speciation analyses, according to the chain-of-custody (COC) forms.

The **Sample ID** value listed on the chain-of-custody (COC) forms did not exactly match the corresponding Sample ID value on the container label for 2208261-24. The discrepancy is described in the table below.

Sample ID Agreement Between COC and Container Labels

Laboratory ID	Sample ID (on COC form)	Sample ID (on container label)	Date/Time Collected
2208261-24	RG_ERCKMD_3_PW-2_2022-08_N	RG_ERCKMD_3_PW-1_2022-08_N	08/09/2022 14:00

Per client request, 2208261-24 was logged in and reported using the **Sample ID** value listed on the container label (*column 3 in the table above*).

The ink on the container label for sample 2208261-22 was partially lost during shipping due to condensation and smearing, and it was difficult to decipher the **Sample ID** on the container label. The client sample (RG_ERCKMD_2_PW-2_2022-08_N, 08/09/22 13:50) was the only item missing from the shipment, so the container with the smeared ink was assigned to 2208261-22 (RG_ERCKMD_2_PW-2_2022-08_N, 08/09/22 13:50). The information that was legible on the container (i.e., **Date collected**, requested analysis = Se speciation) did match the information provided on the COC forms for 2208261-22 (RG_ERCKMD_2_PW-2_2022-08_N, 08/09/22 13:50).

The remaining samples had container labels with legible information.

The sample fractions logged in for Se speciation had been field-filtered prior to receipt at BAL. All samples were stored according to BAL SOPs.

Selenium Speciation

Each aqueous sample was analyzed for selenium speciation using ion chromatography inductively coupled plasma collision reaction cell mass spectrometry (IC-ICP-CRC-MS). Selenium species are chromatographically separated on an ion exchange column and then quantified using inductively coupled plasma collision reaction cell mass spectrometry (ICP-CRC-MS); for more information on this determinative technique, please visit the *Interference Reduction Technology* section on our website. The chromatographic method applied for the analyses provides greater retention of methylseleninic acid and selenomethionine, allowing for more definitive quantitation of these species.

In accordance with the quotation issued for this project, selenium speciation was defined as dissolved selenite [Se(IV)], selenate [Se(VI)], selenocyanate [SeCN], methylseleninic acid [MeSe(IV)], methaneselenonic acid [MeSe(VI)], selenomethionine [SeMet], selenosulfate [SeSO₃], and dimethylselenoxide [DMSeO]. Unknown Se species was defined as the total concentration of all unknown Se species observed during the analysis. This item is identified on the report as [Unk Se Sp].

DMSeO elutes early in the chromatographic run due to the nature of the molecule and the applied chromatographic separation method. Since this species elutes near the dead volume, additional selenium species may coelute. Alternate methods can be applied, upon client request, to increase the separation of DMSeO from potentially co-eluting selenium species.

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

In instances where a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample concentration, the recoveries and the relative percent difference (RPD) are not considered valid indicators of data quality. In such instances, the recoveries of the laboratory fortified blanks (BS) and/or standard reference materials (SRM) demonstrate the accuracy of the applied methods. When the spiking level was less than 25% of the native sample concentration, the spike recovery was not reported (**NR**) and the relative percent difference (RPD) of the MS/MSD set was not calculated (**N/C**).

In cases when either the native sample concentration was non-detectable (reported as less than or equal to the MDL) and/or the corresponding DUP result was also non-detectable, the RPD between the two values was not calculated (**N/C**).

Except for concentration qualifiers, all data were reported without qualification. All associated quality control sample results met the acceptance criteria.

BAL, an accredited laboratory, certifies that the reported results of all analyses for which BAL is NELAP accredited meet all NELAP requirements. For more information, please see the *Report Information* page.

Please feel free to contact us if you have any questions regarding this report.

Sincerely,

A handwritten signature in black ink, appearing to read 'Jeremy Maute', with a stylized flourish at the end.

Jeremy Maute
Senior Project Manager

Jeremy@brooksapplied.com

Report Information

Laboratory Accreditation

BAL is accredited by the *National Environmental Laboratory Accreditation Program* (NELAP) through the State of Florida Department of Health, Bureau of Laboratories (E87982) and is certified to perform many environmental analyses. BAL is also certified by many other states to perform environmental analyses. For a current list of our accreditations/certifications, please visit our website at <http://www.brooksapplied.com/resources/certificates-permits/> or review Tables 1 and 2 in our Accreditation Information. Results reported relate only to the samples listed in the report.

Field Quality Control Samples

Please be notified that certain EPA methods require the collection of field quality control samples of an appropriate type and frequency; failure to do so is considered a deviation from some methods and for compliance purposes should only be done with the approval of regulatory authorities. Please see the specific EPA methods for details regarding required field quality control samples.

Common Abbreviations

AR	as received	MS	matrix spike
BAL	Brooks Applied Labs	MSD	matrix spike duplicate
BLK	method blank	ND	non-detect
BS	blank spike	NR	non-reportable

ICV	initial calibration verification	T	total fraction
MDL	method detection limit	TR	total recoverable fraction
MRL	method reporting limit		

Definition of Data Qualifiers

(Effective 3/23/2020)

E	An estimated value due to the presence of interferences. A full explanation is presented in the narrative.
H	Holding time and/or preservation requirements not met. Please see narrative for explanation.
J	Detected by the instrument, the result is > the MDL but ≤ the MRL. Result is reported and considered an estimate.
J-1	Estimated value. A full explanation is presented in the narrative.
M	Duplicate precision (RPD) was not within acceptance criteria. Please see narrative for explanation.
N	Spike recovery was not within acceptance criteria. Please see narrative for explanation.
R	Rejected, unusable value. A full explanation is presented in the narrative.
U	Result is ≤ the MDL or client requested reporting limit (CRRL). Result reported as the MDL or CRRL.
X	Result is not BLK-corrected and is within 10x the absolute value of the highest detectable BLK in the batch. Result is estimated.
Z	Holding time and/or preservation requirements not established for this method; however, BAL recommendations for holding time were not followed. Please see narrative for explanation.

These qualifiers are based on those previously utilized by Brooks Applied Labs, those found in the EPA SOW ILM03.0, Exhibit B, Section III, pg. B-18, and the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review; USEPA; January 2010. These supersede all previous qualifiers ever employed by BAL.

Re: Regional EVO LAEMP

Dear Mike Pope,

On October 6, 2022, Brooks Applied Labs (BAL) received twenty-six (26) aqueous samples. The samples were logged-in for Se speciation analyses, according to the chain-of-custody (COC) forms.

The sample fractions logged in for Se speciation had been field-filtered prior to receipt at BAL. All samples were stored according to BAL SOPs.

Selenium Speciation

Each aqueous sample was analyzed for selenium speciation using ion chromatography inductively coupled plasma collision reaction cell mass spectrometry (IC-ICP-CRC-MS). Selenium species are chromatographically separated on an ion exchange column and then quantified using inductively coupled plasma collision reaction cell mass spectrometry (ICP-CRC-MS); for more information on this determinative technique, please visit the *Interference Reduction Technology* section on our website. The chromatographic method applied for the analyses provides greater retention of methylseleninic acid and selenomethionine, allowing for more definitive quantitation of these species.

In accordance with the quotation issued for this project, selenium speciation was defined as dissolved selenite [Se(IV)], selenate [Se(VI)], selenocyanate [SeCN], methylseleninic acid [MeSe(IV)], methaneselenonic acid [MeSe(VI)], selenomethionine [SeMet], selenosulfate [SeSO₃], and dimethylselenoxide [DMSeO]. Unknown Se species was defined as the total concentration of all unknown Se species observed during the analysis. This item is identified on the report as [Unk Se Sp].

DMSeO elutes early in the chromatographic run due to the nature of the molecule and the applied chromatographic separation method. Since this species elutes near the dead volume, additional selenium species may coelute. Alternate methods can be applied, upon client request, to increase the separation of DMSeO from potentially co-eluting selenium species.

Chromatographic interference, as indicated by an elevated baseline, or co-eluting peak, was observed for selenosulfate in samples 2210075-02, 2210075-06, 2210075-08, 2210075-09, and 2210075-11. Due to potential bias, the affected results have been qualified as estimated (**J-1**). Upon client request, Brooks Applied Labs can apply a higher dilution to these samples to potentially mitigate the chromatographic interferences, but a higher dilution would elevate the detection limit for SeMet above the client's requested limit of 0.010µg/L.

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

In instances where a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample concentration, the recoveries and the relative percent difference (RPD) are not considered valid indicators of data quality. In such instances, the recoveries of the laboratory fortified blanks (BS) and/or standard reference materials (SRM) demonstrate the accuracy of the applied methods. When the spiking level was less than 25% of the native sample concentration, the spike recovery was not reported (**NR**) and the relative percent difference (RPD) of the MS/MSD set was not calculated (**N/C**).

In cases when either the native sample concentration was non-detectable (reported as less than or equal to the MDL) and/or the corresponding DUP result was also non-detectable, the RPD between the two values was not calculated (**N/C**).

Except for concentration qualifiers, all data were reported without qualification. All associated quality control sample results met the acceptance criteria.

BAL verifies that the reported results of all analyses for which the laboratory is accredited meet the requirements of the accrediting body, unless otherwise noted in the report narrative. For more information regarding accreditations please see the *Report Information* and *Batch Summary* pages. This report must be used in its entirety for interpretation of results.

Please feel free to contact us if you have any questions regarding this report.

Sincerely,

Jeremy Maute

Senior Project Manager

Jeremy@brooksapplied.com

Report Information

General Disclaimers

Test results are based solely upon the sample submitted to Brooks Applied Labs in the condition it was received. This report shall not be reproduced or copied, except in full, without written approval of the laboratory. Brooks Applied Labs is not responsible for the consequences arising from the use of a partial report.

Laboratory Accreditation

BAL maintains accreditation with various state and national agencies for select test methods. For a current list of BAL accreditations, please visit our website at <http://www.brooksapplied.com/resources/certificates-permits/>. The reported analyte/matrix/method combination shall be considered outside BAL's scopes of accreditation unless otherwise identified as ISO, TNI, or ISO,TNI in the tables. It is the responsibility of the client to verify whether a specific accreditation is required for the intended data use.

ISO: ISO/IEC 17025:2017 accredited test method. Issued by ANSI National Accreditation Board (ANAB), #ADE-1447.02

TNI: NELAP accredited test method. Issued by the State of Florida Department of Health, #E87982.

ISO,TNI: Test method is accredited under both the ISO/IEC 17025:2017 and NELAP accreditations referenced above.

Field Quality Control Samples

Please be notified that certain EPA methods require the collection of field quality control samples of an appropriate type and frequency; failure to do so is considered a deviation from some methods and for compliance purposes should only be done with the approval of regulatory authorities. Please see the specific EPA methods for details regarding required field quality control samples.

Common Abbreviations

AR	as received	MS	matrix spike
BAL	Brooks Applied Labs	MSD	matrix spike duplicate
BLK	method blank	ND	non-detect
BS	blank spike	NR	non-reportable
CAL	calibration standard	N/C	not calculated
CCB	continuing calibration blank	PS	post preparation spike
CCV	continuing calibration verification	REC	percent recovery
COC	chain of custody record	RPD	relative percent difference
D	dissolved fraction	SCV	secondary calibration verification
DUP	duplicate	SOP	standard operating procedure
IBL	instrument blank	SRM	reference material
ICV	initial calibration verification	T	total fraction
MDL	method detection limit	TR	total recoverable fraction
MRL	method reporting limit		

Definition of Data Qualifiers

E	An estimated value due to the presence of interferences. A full explanation is presented in the narrative.
H	Holding time and/or preservation requirements not met. Please see narrative for explanation.
J	Detected by the instrument, the result is > the MDL but ≤ the MRL. Result is reported and considered an estimate.
J-1	Estimated value. A full explanation is presented in the narrative.
M	Duplicate precision (RPD) was not within acceptance criteria. Please see narrative for explanation.
N	Spike recovery was not within acceptance criteria. Please see narrative for explanation.
R	Rejected, unusable value. A full explanation is presented in the narrative.
U	Result is ≤ the MDL or client requested reporting limit (CRRL). Result reported as the MDL or CRRL.
X	Result is not BLK-corrected and is within 10x the absolute value of the highest detectable BLK in the batch. Result is estimated.
Z	Holding time and/or preservation requirements not established for this method; however, BAL recommendations for holding time were not followed. Please see narrative for explanation.

Re: Regional Effects Program

Dear Mike Pope,

On November 10, 2022, Brooks Applied Labs (BAL) received sixty-four (64) aqueous samples. The samples were logged-in for total recoverable selenium [Se], dissolved Se [Se], and Se speciation analyses, according to the chain-of-custody (COC) forms.

Date/Time Collected values listed on the chain-of-custody (COC) forms did not exactly match the corresponding **Date/Time Collected** values on the container labels for 2211127-76, 2211127-77, 2211127-82, and 2211127-83. The discrepancies are described in the table below.

Date/Time Collected Discrepancies

Laboratory ID	Sample ID	Date/Time Collected (on COC form)	Date/Time Collected (on container label)
2211127-76	RG_ALUSM_WS_LAEMP_EVO_2022-11_NP-NAL	11/03/2022 14:00	11/03/2022 14:30
2211127-77	RG_ALUSM_WS_LAEMP_EVO_2022-11_NP-NAL	11/03/2022 14:00	11/03/2022 14:30
2211127-82	RG_FBLANK2_WS_LAEMP_EVO_2022-11_NP-NAL	11/03/2022 09:00	11/03/2022 11:00
2211127-83	RG_FBLANK2_WS_LAEMP_EVO_2022-11_NP-NAL	11/03/2022 09:00	11/03/2022 11:00

Per client request, samples 2211127-76, 2211127-77, 2211127-82, and 2211127-83 were logged in and reported using the **Date/Time Collected** values listed on the COC form (*column 3 in the table above*).

Chain-of-custody (COC) forms were received with the sample shipment and the laboratory documented receipt of the samples on these COC forms. Revised COC forms (*for COC pages 2, 3, and 4*) were subsequently provided via email. Per client request, BAL was instructed to use the corrected **Date/Time Collected** values (on the revised COC forms) for reporting. Please see the revised COC forms at the end of this report. The cases where changes to **Date/Time Collected** values were requested are highlighted in

yellow on the revised COC forms. In order to document custody, both sets of COC forms are included in this report.

The container labels for 2211127-02 and 2211127-20 both listed the following information: (*RG_ERCKDT_1_PW-2_2022-10_N, 10/31/2022 08:45*), which describes the information on the COC forms that corresponds to 2211127-02. A container for (*RG_ERCKUT_1_PW-2_2022-10_N, 10/31/2022 13:15*), which describes the information on the COC forms that corresponds to 2211127-20, was not received. Per client request, the *RG_ERCKDT_1_PW-2_2022-10_N, 10/31/2022 08:45* was assigned to 2211127-20 and sample 2211127-02 was assigned to (*RG_ERCKUT_1_PW-2_2022-10_N, 10/31/2022 13:15*).

The dissolved fraction for *RG_RIVER_WS_LAEMP_EVO_2022-11_NP-NAL* (Laboratory ID = 2211127-46) arrived in a container that leaked during shipping. The entire sample volume for 2211127-46 was lost. A fraction of the corresponding unfiltered, total recoverable Se fraction (laboratory ID: 2211127-47) was filtered (0.45 μm) into a new container to support the dissolved Se analysis for *RG_RIVER_WS_LAEMP_EVO_2022-11_NP-NAL*. This new dissolved Se fraction was preserved (pH < 2) by BAL staff at the time of receipt and logged in under 2211127-46. The filtration for 2211127-46 took place beyond the (2-calander day) filtration holding time. Consequently, the dissolved Se result for 2211127-46 is qualified (**H**) for a filtration holding time violation.

The sample fractions for total recoverable Se and dissolved Se were not preserved in the field. The samples were preserved (pH < 2) upon receipt at BAL. All sample fractions for total recoverable Se and dissolved Se were preserved within the (14 calendar day) preservation holding time.

The sample fractions logged in for Se speciation and dissolved Se had been field-filtered prior to receipt at BAL. All samples were stored according to BAL SOPs.

Total Recoverable Se and Dissolved Se

Each aqueous sample fraction for dissolved Se was digested in a closed vessel (bomb) with nitric and hydrochloric acids. The resulting digests were analyzed for Se content via inductively coupled plasma triple quadrupole mass spectrometry (ICP-QQQ-MS). The ICP-QQQ-MS instrumentation uses advanced interference removal techniques to ensure accuracy of the sample results. For more information, please visit the *Interference Reduction Technology* section on our website, brooksupplied.com.

The dissolved Se result for 2211127-46 is qualified (**H**) for filtration beyond the (2-calander day) filtration holding time.

Selenium Speciation

Each aqueous sample was analyzed for selenium speciation using ion chromatography inductively coupled plasma collision reaction cell mass spectrometry (IC-ICP-CRC-MS). Selenium species are chromatographically separated on an ion exchange column and then quantified using inductively coupled plasma collision reaction cell mass spectrometry (ICP-CRC-MS); for more information on this determinative technique, please visit the *Interference Reduction Technology* section on our website. The chromatographic method applied for the analyses provides greater retention of methylseleninic acid and selenomethionine, allowing for more definitive quantitation of these species.

In accordance with the quotation issued for this project, selenium speciation was defined as dissolved selenite [Se(IV)], selenate [Se(VI)], selenocyanate [SeCN], methylseleninic acid [MeSe(IV)], methaneselenonic acid [MeSe(VI)], selenomethionine [SeMef], selenosulfate [SeSO₃], and dimethylselenoxide [DMSeO]. Unknown Se species was defined as the total concentration of all unknown Se species observed during the analysis. This item is identified in the report as [Unk Se Sp].

DMSeO elutes early in the chromatographic run due to the nature of the molecule and the applied chromatographic separation method. Since this species elutes near the dead volume, additional selenium species may coelute. Alternate methods can be applied, upon client request, to increase the separation of DMSeO from potentially co-eluting selenium species.

Poor mass balance was observed in *RG_RIVER_WS_LAEMP_EVO_2022-11_N* when the sum of Se species (in sample 2211127-45) were compared to the corresponding dissolved Se result (2211127-46). Container labels were inspected and there was no indication that samples had been mis-labeled. Re-analyses confirmed the results for 2211127-45, 2211127-46, and 2211127-47. Consequently, no additional corrective actions are necessary. Results for these samples are reported from initial injections, and the reported results are deemed representative of the submitted containers.

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

In instances where a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample concentration, the recoveries and the relative percent difference (RPD) are not considered valid indicators of data quality. In such instances, the recoveries of the laboratory fortified blanks (BS) and/or standard reference materials (SRM) demonstrate the accuracy of the applied methods. When the spiking level was less than 25% of the native sample concentration, the spike recovery was not reported (**NR**) and the relative percent difference (RPD) of the MS/MSD set was not calculated (**N/C**).

In cases when either the native sample concentration was non-detectable (reported as less than or equal to the MDL) and/or the corresponding DUP result was also non-detectable, the RPD between the two values was not calculated (**N/C**).

Except for concentration qualifiers and items noted above, all data were reported without qualification. All associated quality control sample results met the acceptance criteria.

BAL verifies that the reported results of all analyses for which the laboratory is accredited meet the requirements of the accrediting body, unless otherwise noted in the report narrative. For more information regarding accreditations please see the *Report Information* and *Batch Summary* pages. This report must be used in its entirety for interpretation of results.

Please feel free to contact us if you have any questions regarding this report.

Sincerely,

A handwritten signature in black ink, appearing to read 'Jeremy Maute', with a stylized flourish at the end.

Jeremy Maute

Senior Project Manager

Report Information

General Disclaimers

Test results are based solely upon the sample submitted to Brooks Applied Labs in the condition it was received. This report shall not be reproduced or copied, except in full, without written approval of the laboratory. Brooks Applied Labs is not responsible for the consequences arising from the use of a partial report.

Laboratory Accreditation

BAL maintains accreditation with various state and national agencies for select test methods. For a current list of BAL accreditations, please visit our website at <http://www.brooksapplied.com/resources/certificates-permits/>. The reported analyte/matrix/method combination shall be considered outside BAL's scopes of accreditation unless otherwise identified as ISO, TNI, or ISO,TNI in the tables. It is the responsibility of the client to verify whether a specific accreditation is required for the intended data use.

ISO: ISO/IEC 17025:2017 accredited test method. Issued by ANSI National Accreditation Board (ANAB), #ADE-1447.02

TNI: NELAP accredited test method. Issued by the State of Florida Department of Health, #E87982.

ISO,TNI: Test method is accredited under both the ISO/IEC 17025:2017 and NELAP accreditations referenced above.

Field Quality Control Samples

Please be notified that certain EPA methods require the collection of field quality control samples of an appropriate type and frequency; failure to do so is considered a deviation from some methods and for compliance purposes should only be done with the approval of regulatory authorities. Please see the specific EPA methods for details regarding required field quality control samples.

Common Abbreviations

AR	as received	MS	matrix spike
BAL	Brooks Applied Labs	MSD	matrix spike duplicate
BLK	method blank	ND	non-detect
BS	blank spike	NR	non-reportable
CAL	calibration standard	N/C	not calculated
CCB	continuing calibration blank	PS	post preparation spike
CCV	continuing calibration verification	REC	percent recovery
COC	chain of custody record	RPD	relative percent difference
D	dissolved fraction	SCV	secondary calibration verification
DUP	duplicate	SOP	standard operating procedure
IBL	instrument blank	SRM	reference material
ICV	initial calibration verification	T	total fraction
MDL	method detection limit	TR	total recoverable fraction
MRL	method reporting limit		

Definition of Data Qualifiers

E	An estimated value due to the presence of interferences. A full explanation is presented in the narrative.
H	Holding time and/or preservation requirements not met. Please see narrative for explanation.
J	Detected by the instrument, the result is > the MDL but ≤ the MRL. Result is reported and considered an estimate.
J-1	Estimated value. A full explanation is presented in the narrative.
M	Duplicate precision (RPD) was not within acceptance criteria. Please see narrative for explanation.
N	Spike recovery was not within acceptance criteria. Please see narrative for explanation.
R	Rejected, unusable value. A full explanation is presented in the narrative.
U	Result is ≤ the MDL or client requested reporting limit (CRRL). Result reported as the MDL or CRRL.
X	Result is not BLK-corrected and is within 10x the absolute value of the highest detectable BLK in the batch. Result is estimated.
Z	Holding time and/or preservation requirements not established for this method; however, BAL recommendations for holding time were not followed. Please see narrative for explanation.

Hi Jeremy!

First, thank you for being patient with our mislabeling!

I have looked at the results please name the samples as follows:

2211127-02 RG_ERCKUT_1_PW-2_2022-10_N

2211127-20 RG_ERCKDT_1_PW-2_2022-10_N

These can all be submitted in the same lab file now.

Thanks!!

Robin

Subject: Brooks Preliminary Report/EDD, WO 2211127: Regional Effects Program, REP Project - Confidential

Attached are the [preliminary report and EDD](#) for COC ID **EVO LAEMP NOV 2022**, associated with the REP Project.

Poor mass balance was observed in *RG_RIVER_WS_LAEMP_EVO_2022-11_N* when the sum of Se species (in sample 2211127-45) were compared to the corresponding dissolved Se result (2211127-46). Some confirmation analyses have been completed. The speciation profile in 2211127-45 looks like a *RG_RIVER_WS* sample, but the mass balance with the dissolved Se fraction is off. Additional confirmation analyses are underway. Consequently, the results in the attached report are only preliminary. Once the confirmation analyses are completed, a final report will be issued. In the final report, results may change for some samples (*potentially 2211127-45 or 2211127-46*) depending on the findings in the re-analyses.

Date/Time Collected values listed on the chain-of-custody (COC) forms did not exactly match the corresponding **Date/Time Collected** values on the container labels for 2211127-76, 2211127-77, 2211127-82, and 2211127-83. The discrepancies are described in the table below.

Date/Time Collected Discrepancies

Laboratory ID	Sample ID	Date/Time Collected (on COC form)	Date/Time Collected (on container label)
2211127-76	RG_ALUSM_WS_LAEMP_EVO_2022-11_NP-NAL	11/03/2022 14:00	11/03/2022 14:30
2211127-77	RG_ALUSM_WS_LAEMP_EVO_2022-11_NP-NAL	11/03/2022 14:00	11/03/2022 14:30
2211127-82	RG_FBLANK2_WS_LAEMP_EVO_2022-11_NP-NAL	11/03/2022 09:00	11/03/2022 11:00
2211127-83	RG_FBLANK2_WS_LAEMP_EVO_2022-11_NP-NAL	11/03/2022 09:00	11/03/2022 11:00

Per request, samples 2211127-76, 2211127-77, 2211127-82, and 2211127-83 were logged in and reported using the **Date/Time Collected** values listed on the COC form (*column 3 in the table above*).

Chain-of-custody (COC) forms were received with the sample shipment and the laboratory documented receipt of the samples on these COC forms. Revised COC forms (*for COC pages 2, 3, and 4*) were subsequently provided via email. Per client request, BAL was instructed to use the corrected **Date/Time Collected** values (on the revised COC forms) for reporting. Please see the revised COC forms at the end of this report. The cases where changes to **Date/Time Collected** values were requested are highlighted in yellow on the revised COC forms. In order to document custody, both sets of COC forms are included in this report.

The container labels for 2211127-02 and 2211127-20 both listed the following information: (*RG_ERCKDT_1_PW-2_2022-10_N, 10/31/2022 08:45*). This describes the information on the COC forms that corresponds to 2211127-02. A container for *RG_ERCKUT_1_PW-2_2022-10_N, 10/31/2022 13:15*, which describes the information on the COC forms that corresponds to 2211127-20, was not received. The two fractions labeled *RG_ERCKDT_1_PW-2_2022-10_N, 10/31/2022 08:45* were logged in under 2211127-02 and 2211127-20. AT this time, it is unclear if the field ID assignments are correct for 2211127-02 and 2211127-20.

The dissolved fraction for *RG_RIVER_WS_LAEMP_EVO_2022-11_NP-NAL* (Laboratory ID = 2211127-46) arrived in a container that leaked during shipping. The entire sample volume for 2211127-46 was lost. A fraction of the corresponding unfiltered, total recoverable Se fraction (laboratory ID: 2211127-47) was filtered (0.45 µm) into a new container to support the dissolved Se analysis for *RG_RIVER_WS_LAEMP_EVO_2022-11_NP-NAL*. This new dissolved Se fraction was preserved (pH < 2) by BAL staff at the time of receipt and logged in under 2211127-46. The filtration for 2211127-46 took place beyond the (2-calendar day) filtration holding time. Consequently, the dissolved Se result for 2211127-46 is qualified (**H**) for a filtration holding time violation.

The sample fractions for total recoverable Se and dissolved Se were not preserved in the field. The samples were preserved (pH < 2) upon receipt at BAL. All sample fractions for total recoverable Se and dissolved Se were preserved within the (14 calendar day) preservation holding time.

As always, please contact us if there are any questions about this data.

Regards,

Jeremy Maute
Senior Project Manager

Re: Regional Effects Program

Dear Mike Pope,

On December 9, 2022, Brooks Applied Labs (BAL) received twenty-five (25) aqueous samples. The samples were logged-in for dissolved selenium [Se] and Se speciation analyses, according to the chain-of-custody (COC) forms.

Sample ID values provided on the chain-of-custody (COC) forms did not exactly match the corresponding **Sample ID** values listed on container labels for several samples. The discrepancies are described in the table below.

Sample ID Agreement Issues

Laboratory ID	Sample ID (On COC form)	Sample ID (On container label)
2212162-16	RG_ERCKDT_1_PW_1_2022-12_N	RG_ERCKDT1_PW_1_2022-12_N
2212162-18	RG_ERCKDT_1_PW_2_2022-12_N	RG_ERCKDT1_PW_2_2022-12_N

2212162-50	RG_ERCKMD_3_PW_3_2022-12_N	RG_ERCKND_3_PW_3_2022-11-28_N

BAL was instructed to use the **Sample ID** values on the COC form (*column 2 in the table above*) for reporting.

Several containers were damaged during shipment. In each case, the entire volume was lost, leaving no sample available for quantitation. The sample containers that were broken are described in the table below.

Sample Containers were damaged during shipment. Entire volume lost

Laboratory ID	Sample ID	Date/Time Collected	Analytical Parameter
2212162-1	RG_ERCKUT_1_PW_1_2022-12_N	11/29/22 09:30	Se Speciation
2212162-2	RG_ERCKUT_1_PW_1_2022-12_N	11/29/22 09:30	Dissolved Se
2212162-5	RG_ERCKUT_2_PW_1_2022-12_N	11/29/22 09:30	Se Speciation

2212162-47	RG_ERCKMD_3_PW_2_2022-12_N	11/28/22 11:45	Se Speciation
2212162-48	RG_ERCKMD_3_PW_2_2022-12_N	11/28/22 11:45	Dissolved Se

BAL was unable to provide results for the samples in the table above.

The sample fractions for dissolved Se were not preserved in the field. The samples were preserved (pH < 2) upon receipt at BAL. The preservation took place beyond the (14-calendar day) preservation holding time for 2212162-50. Consequently, the dissolved Se result for 2212162-50 is qualified (**H**) for the filtration holding time violation. The remaining dissolved Se fractions were preserved within the (14 calendar day) preservation holding time.

The sample fractions logged in for Se speciation and dissolved Se had been field-filtered prior to receipt at BAL. All samples were stored according to BAL SOPs.

Total Recoverable Se and Dissolved Se

Each aqueous sample fraction for dissolved Se was digested in a closed vessel (bomb) with nitric and hydrochloric acids. The resulting digests were analyzed for Se content via inductively coupled plasma triple quadrupole mass spectrometry (ICP-QQQ-MS). The ICP-QQQ-MS instrumentation uses advanced interference removal techniques to ensure accuracy of the sample results. For more information, please visit the *Interference Reduction Technology* section on our website, brooksapplied.com.

The dissolved Se result for 2212162-50 is qualified (**H**) for preservation beyond the (14-calander day) preservation holding time.

Selenium Speciation

Each aqueous sample was analyzed for selenium speciation using ion chromatography inductively coupled plasma collision reaction cell mass spectrometry (IC-ICP-CRC-MS). Selenium species are chromatographically separated on an ion exchange column and then quantified using inductively coupled plasma collision reaction cell mass spectrometry (ICP-CRC-MS); for more information on this determinative technique, please visit the *Interference Reduction Technology* section on our website. The chromatographic method applied for the analyses provides greater retention of methylseleninic acid and selenomethionine, allowing for more definitive quantitation of these species.

In accordance with the quotation issued for this project, selenium speciation was defined as dissolved selenite [Se(IV)], selenate [Se(VI)], selenocyanate [SeCN], methylseleninic acid [MeSe(IV)], methaneselenonic acid [MeSe(VI)], selenomethionine [SeMef], selenosulfate [SeSO₃], and dimethylselenoxide [DMSeO]. Unknown Se species was defined as the total concentration of all unknown Se species observed during the analysis. This item is identified in the report as [Unk Se Sp].

DMSeO elutes early in the chromatographic run due to the nature of the molecule and the applied chromatographic separation method. Since this species elutes near the dead volume, additional selenium species may coelute. Alternate methods can be applied, upon client request, to increase the separation of DMSeO from potentially co-eluting selenium species.

The instrument sensitivity drifted after the initial calibration in sequence S221328, so a second calibration was analyzed after the samples. This second calibration was applied to the entire sequence. The recoveries of all continuing calibration verification (CCV) standards and matrix spike sets were within acceptance limits, demonstrating the suitability of this approach.

Poor mass balance was observed in several samples when the sum of Se species were compared to the corresponding dissolved Se results. Multiple re-analyses confirmed the results for dissolved Se and Se speciation fractions. Consequently, no additional corrective actions are necessary. The reported results are deemed representative of the submitted containers.

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

In instances where a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample concentration, the recoveries, and the relative percent difference (RPD) values are not considered valid indicators of data quality. In such instances, the recoveries of the laboratory fortified blanks (BS) and/or standard reference materials (SRM) demonstrate the accuracy of the applied methods. When the spiking level was less than 25% of the native sample concentration, the spike recovery was not reported (NR) and the relative percent difference (RPD) of the MS/MSD set was not calculated (N/C).

In cases when either the native sample concentration was non-detectable (reported as less than or equal to the MDL) and/or the corresponding DUP result was also non-detectable, the RPD between the two values was not calculated (**N/C**).

Except for concentration qualifiers and the (**H**) qualifier for preservation beyond the (14-calander day) preservation holding time, all data were reported without qualification. All associated quality control sample results met the acceptance criteria.

BAL verifies that the reported results of all analyses for which the laboratory is accredited meet the requirements of the accrediting body, unless otherwise noted in the report narrative. For more information regarding accreditations please see the *Report Information* and *Batch Summary* pages. This report must be used in its entirety for interpretation of results.

Please feel free to contact us if you have any questions regarding this report.

Sincerely,

Jeremy Maute

Senior Project Manager

Report Information

General Disclaimers

Test results are based solely upon the sample submitted to Brooks Applied Labs in the condition it was received. This report shall not be reproduced or copied, except in full, without written approval of the laboratory. Brooks Applied Labs is not responsible for the consequences arising from the use of a partial report.

Laboratory Accreditation

BAL maintains accreditation with various state and national agencies for select test methods. For a current list of BAL accreditations, please visit our website at <http://www.brooksapplied.com/resources/certificates-permits/>. The reported analyte/matrix/method combination shall be considered outside BAL's scopes of accreditation unless otherwise identified as ISO, TNI, or ISO,TNI in the tables. It is the responsibility of the client to verify whether a specific accreditation is required for the intended data use.

ISO: ISO/IEC 17025:2017 accredited test method. Issued by ANSI National Accreditation Board (ANAB), #ADE-1447.02

TNI: NELAP accredited test method. Issued by the State of Florida Department of Health, #E87982.

ISO,TNI: Test method is accredited under both the ISO/IEC 17025:2017 and NELAP accreditations referenced above.

Field Quality Control Samples

Please be notified that certain EPA methods require the collection of field quality control samples of an appropriate type and frequency; failure to do so is considered a deviation from some methods and for compliance purposes should only be done with the approval of regulatory authorities. Please see the specific EPA methods for details regarding required field quality control samples.

Common Abbreviations

AR	as received	MS	matrix spike
BAL	Brooks Applied Labs	MSD	matrix spike duplicate
BLK	method blank	ND	non-detect
BS	blank spike	NR	non-reportable
CAL	calibration standard	N/C	not calculated
CCB	continuing calibration blank	PS	post preparation spike
CCV	continuing calibration verification	REC	percent recovery
COC	chain of custody record	RPD	relative percent difference
D	dissolved fraction	SCV	secondary calibration verification
DUP	duplicate	SOP	standard operating procedure
IBL	instrument blank	SRM	reference material
ICV	initial calibration verification	T	total fraction
MDL	method detection limit	TR	total recoverable fraction
MRL	method reporting limit		

Definition of Data Qualifiers

E	An estimated value due to the presence of interferences. A full explanation is presented in the narrative.
H	Holding time and/or preservation requirements not met. Please see narrative for explanation.
J	Detected by the instrument, the result is > the MDL but ≤ the MRL. Result is reported and considered an estimate.
J-1	Estimated value. A full explanation is presented in the narrative.
M	Duplicate precision (RPD) was not within acceptance criteria. Please see narrative for explanation.
N	Spike recovery was not within acceptance criteria. Please see narrative for explanation.
R	Rejected, unusable value. A full explanation is presented in the narrative.
U	Result is ≤ the MDL or client requested reporting limit (CRRL). Result reported as the MDL or CRRL.
X	Result is not BLK-corrected and is within 10x the absolute value of the highest detectable BLK in the batch. Result is estimated.
Z	Holding time and/or preservation requirements not established for this method; however, BAL recommendations for holding time were not followed. Please see narrative for explanation.

Received: December 9, 2022 7:07
Tracking No: RWHV97351 via Courier
Coolant Type: Blue Ice
Temperature: -2.4 °C

Description: Cooler 4
Damaged in transit? No
Returned to client? No
Comments: R-IR-2

Custody seals present? No
Custody seals intact? No
COC present? Yes

COC ID: **EVO LAEMP DEC 2022**

TURNAROUND TIME: RUSH

Re: REP

Dear Mike Pope,

On May 19, 2022, Brooks Applied Labs (BAL) received fourteen (14) solid samples at an acceptable temperature of 1.8°C

Each solid sample was logged-in for the analysis of total recoverable Se, Se sequential extraction, and total solids.

Some of the sediments were very wet and the water overlaying the sediments in the containers was decanted before the sediments were stored frozen. After receipt, all solid samples were stored in accordance with BAL SOPs.

Se Selective Sequential Extraction (SSE)

An aliquot of each solid was extracted in accordance with BAL's in-house five-step selective sequential extraction for Se. The samples were extracted with a series of reagents designed to target the following fractions:

SSE Fraction	Fraction Description
F1	Se present as salt (e.g., SeO_4^{2-} , MeSe(IV) , SeCN)
F2	Weakly adsorbed Se (e.g., SeO_4^{2-} , SeO_3^{2-} , SeCN , MeSe(IV))
F3	Amorphous and crystalline Se (e.g., S_2Se , Se^0)
F4	Selenides (e.g., HgSe , PbSe , CdSe , ZnSe)
F5	Residual Se

All resulting SSE fractions were directly analyzed for Se via inductively coupled plasma triple quadrupole mass spectrometry (ICP-QQQ-MS) and have been reported as Se(F1), Se(F2), Se(F3), Se(F4), and Se(F5) according to the corresponding extraction step (see table above).

Batch B221147 (SSE F1)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

Batch B221165 (SSE F2)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

Batch B221166 (SSE F3)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

The laboratory duplicate sample (B221166-DUP2) produced a relative percent difference (RPD) value greater than the control limit of 25%, at 27%. Re-analysis confirmed the RPD outlier. Consequently, the Se(F3) result for the source sample 2205263-03 is qualified as estimated (**M**) due to the poor precision.

Batch B221167 (SSE F4)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

The laboratory duplicate sample (B221167-DUP1) produced an RPD value greater than the control limit of 25%, at 44%. However, secondary criteria met (i.e., average result $\leq 5x$ the MRL and results within $2x$ the MRL of each other). No qualification of data was necessary.

Batch B221168 (SSE F5)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

Se Speciation for the SSE

Fractions F1 and F2 of the SSE were also analyzed for individual Se species via ion chromatography inductively coupled plasma collision reaction cell mass spectrometry (IC-ICP-CRC-MS). Selenium species were chromatographically separated on an ion exchange column and then quantified using inductively coupled plasma collision reaction cell mass spectrometry (ICP-CRC-MS); for more information on this determinative technique, please visit the *Interference Reduction Technology* section on our website. The chromatographic method applied for the analyses provides greater retention of methylseleninic acid and selenomethionine, allowing for more definitive quantitation of these species.

Selenium speciation for these SSE fractions was defined as dissolved selenite [*Se(IV)*], selenate [*Se(VI)*], selenocyanate [*SeCN*], methylseleninic acid [*MeSe(IV)*], selenomethionine [*SeMet*], selenosulfate [*SeSO₃*], and dimethylselenoxide [*DMeSeO*]. Methaneselenonic acid [*MeSe(VI)*] is reported under *Se Unk A*. The total concentration of any remaining unidentified Se-containing species detected in each sample has also been reported as [*Unk Se Sp*].

DMeSeO elutes early in the chromatographic run due to the nature of the molecule and the applied chromatographic separation method. Since this species elutes near the dead volume, additional Se species may coelute. Alternate methods can be applied, upon client request, to increase the separation of DMeSeO from potentially co-eluting Se species.

Batch B221133 (Selenium Speciation on SSE F1)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the Sample Results page for sample-specific MDLs, MRLs, and other details.

The laboratory duplicate sample (B221133-DUP4) produced an RPD value for *MeSe(IV) F1*, which was greater than the control limit of 25%, at 30%. However, secondary criteria met (i.e., average result \leq 5x the MRL and results within 2x the MRL of each other). No qualification of data was necessary.

Batch B221134 (Selenium Speciation on SSE F2)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the Sample Results page for sample-specific MDLs, MRLs, and other details.

RPD values were greater than the control limit for *Unk Se Sp F2* in B221134-DUP1, B221134-DUP3, and B221134-DUP2. The laboratory duplicate sample (B221134-DUP4) yielded an RPD value for *SeSO3 F2*, which was greater than the control limit of 25%. In each case, secondary criteria met (i.e., average result \leq 5x the MRL and results within 2x the MRL of each other). No qualification of data was necessary.

Total Recoverable Se (EPA 3050b MOD)

An aliquot of each solid was digested via modified EPA Method 3050B, using additions of concentrated nitric acid, hydrogen peroxide, and hydrochloric acid. The resulting digests were analyzed for Se content via inductively coupled plasma triple quadrupole mass spectrometry (ICP-QQQ-MS). The ICP-QQQ-MS instrumentation uses advanced interference removal techniques to ensure accuracy of the sample results. For more information, please visit the *Interference Reduction Technology* section on our website, brooksapplied.com.

Batch B221186 (Total Recoverable Se)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the Sample Results page for sample-specific MDLs, MRLs, and other details.

Batch B221244 (Total Recoverable Se)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the Sample Results page for sample-specific MDLs, MRLs, and other details.

Percent Total Solids (SOP BAL-0501)

An aliquot of each solid was measured into a pre-weighed vessel, dried in an oven at 105°C overnight, weighed again, and the percent of dried solid material was calculated.

Batch B221142 (%TS)

%TS results were used to dry-weight correct results for the remaining analytical parameters.

In instances when a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample concentration, the recoveries and the RPD were not considered valid indicators of data quality. In such instances, the recoveries of the blank spikes (BS) and/or standard reference materials (SRM) demonstrate the accuracy of the applied methods. When the spiking level was less than 25% of the native sample concentration, the spike recovery was not reported (NR) and the RPD of the MS/MSD set was not calculated (N/C).

Except for concentration qualifiers and any items noted above, all data were reported without qualification and all associated quality control sample results met the acceptance criteria.

BAL, an accredited laboratory, certifies that the reported results of all analyses for which BAL is NELAP accredited meet all NELAP requirements. For more information, please see the Report Information page.

Please feel free to contact us if you have any questions regarding this report.

Sincerely,

A handwritten signature in black ink, appearing to read 'Jeremy Maute', with a stylized flourish at the end.

Jeremy Maute

Report Information

Laboratory Accreditation

BAL is accredited by the *National Environmental Laboratory Accreditation Program* (NELAP) through the State of Florida Department of Health, Bureau of Laboratories (E87982) and is certified to perform many environmental analyses. BAL is also certified by many other states to perform environmental analyses. For a current list of our accreditations/certifications, please visit our website at <http://www.brooksapplied.com/resources/certificates-permits/> or review Tables 1 and 2 in our Accreditation Information. Results reported relate only to the samples listed in the report.

Field Quality Control Samples

Please be notified that certain EPA methods require the collection of field quality control samples of an appropriate type and frequency; failure to do so is considered a deviation from some methods and for compliance purposes should only be done with the approval of regulatory authorities. Please see the specific EPA methods for details regarding required field quality control samples.

Common Abbreviations

AR	as received	MS	matrix spike
BAL	Brooks Applied Labs	MSD	matrix spike duplicate
BLK	method blank	ND	non-detect
BS	blank spike	NR	non-reportable
CAL	calibration standard	N/C	not calculated
CCB	continuing calibration blank	PS	post preparation spike
CCV	continuing calibration verification	REC	percent recovery
COC	chain of custody record	RPD	relative percent difference
D	dissolved fraction	SCV	secondary calibration verification
DUP	duplicate	SOP	standard operating procedure
IBL	instrument blank	SRM	reference material
ICV	initial calibration verification	T	total fraction
MDL	method detection limit	TR	total recoverable fraction
MRL	method reporting limit		

Definition of Data Qualifiers

(Effective 3/23/2020)

E	An estimated value due to the presence of interferences. A full explanation is presented in the narrative.
H	Holding time and/or preservation requirements not met. Please see narrative for explanation.
J	Detected by the instrument, the result is > the MDL but ≤ the MRL. Result is reported and considered an estimate.
J-1	Estimated value. A full explanation is presented in the narrative.
M	Duplicate precision (RPD) was not within acceptance criteria. Please see narrative for explanation.
N	Spike recovery was not within acceptance criteria. Please see narrative for explanation.
R	Rejected, unusable value. A full explanation is presented in the narrative.
U	Result is ≤ the MDL or client requested reporting limit (CRRL). Result reported as the MDL or CRRL.
X	Result is not BLK-corrected and is within 10x the absolute value of the highest detectable BLK in the batch. Result is estimated.
Z	Holding time and/or preservation requirements not established for this method; however, BAL recommendations for holding time were not followed. Please see narrative for explanation.

These qualifiers are based on those previously utilized by Brooks Applied Labs, those found in the EPA SOW ILM03.0, Exhibit B, Section III, pg. B-18, and the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review; USEPA; January 2010. These supersede all previous qualifiers ever employed by BAL.

Re: F2 SRF FST

Dear Brett Mason,

On May 19, 2022, Brooks Applied Labs (BAL) received two (2) aqueous samples and three (3) solid samples at an acceptable temperature of -0.7 °C.

Results for aqueous samples are reported in a separate report (work order 2205256). Results for the solid samples are described in this report. Each solid sample was logged-in for the analysis of total recoverable Se, Se sequential extraction, and total solids.

Upon receipt, the water overlaying the sediments in the containers was decanted before the sediments were stored frozen. After receipt, all solid samples were stored in accordance with BAL SOPs.

Se Selective Sequential Extraction (SSE)

An aliquot of each solid was extracted in accordance with BAL's in-house five-step selective sequential extraction for Se. The samples were extracted with a series of reagents designed to target the following fractions:

SSE Fraction	Fraction Description
F1	Se present as salt (e.g., SeO_4^{2-} , MeSe(IV) , SeCN)
F2	Weakly adsorbed Se (e.g., SeO_4^{2-} , SeO_3^{2-} , SeCN , MeSe(IV))
F3	Amorphous and crystalline Se (e.g., S_2Se , Se^0)
F4	Selenides (e.g., HgSe , PbSe , CdSe , ZnSe)
F5	Residual Se

All resulting SSE fractions were directly analyzed for Se via inductively coupled plasma triple quadrupole mass spectrometry (ICP-QQQ-MS) and have been reported as Se(F1), Se(F2), Se(F3), Se(F4), and Se(F5) according to the corresponding extraction step (see table above).

Batch B221147 (SSE F1)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

Batch B221165 (SSE F2)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

Batch B221166 (SSE F3)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

Batch B221167 (SSE F4)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

The laboratory duplicate sample (B221167-DUP1) produced an RPD value greater than the control limit of 25%, at 44%. However, secondary criteria met (i.e., average result $\leq 5x$ the MRL and results within $2x$ the MRL of each other). No qualification of data was necessary.

Batch B221168 (SSE F5)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

Se Speciation for the SSE

Fractions F1 and F2 of the SSE were also analyzed for individual Se species via ion chromatography inductively coupled plasma collision reaction cell mass spectrometry (IC-ICP-CRC-MS). Selenium species were chromatographically separated on an ion exchange column and then quantified using inductively coupled plasma collision reaction cell mass spectrometry (ICP-CRC-MS); for more information on this determinative technique, please visit the *Interference Reduction Technology* section on our website. The chromatographic method applied for the analyses provides greater retention of methylseleninic acid and selenomethionine, allowing for more definitive quantitation of these species.

Selenium speciation for these SSE fractions was defined as dissolved selenite [*Se(IV)*], selenate [*Se(VI)*], selenocyanate [*SeCN*], methylseleninic acid [*MeSe(IV)*], selenomethionine [*SeMet*], selenosulfate [*SeSO₃*], and dimethylselenoxide [*DMSeO*]. Methaneselenonic acid [*MeSe(VI)*] is reported under *Se Unk A*. The total concentration of any remaining unidentified Se-containing species detected in each sample has also been reported as [*Unk Se Sp*].

DMSeO elutes early in the chromatographic run due to the nature of the molecule and the applied chromatographic separation method. Since this species elutes near the dead volume, additional Se species may coelute. Alternate methods can be applied, upon client request, to increase the separation of DMSeO from potentially co-eluting Se species.

Batch B221133 (Selenium Speciation on SSE F1)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the Sample Results page for sample-specific MDLs, MRLs, and other details.

SeMet was observed at a concentration above the MDL in sample 2205262-03. 2205262-03 was used as the source sample for the matrix spike/matrix spike duplicate pair (B221133-MS1/B221133-MSD1), and the presence of SeMet was confirmed. With the confirmation that the SeMet peak was appropriately assigned, the selenium speciation results for 2205262-03 are reported from the initial injection in batch B221133.

Batch B221134 (Selenium Speciation on SSE F2)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the Sample Results page for sample-specific MDLs, MRLs, and other details.

RPD values were greater than the control limit for *Unk Se Sp F2* in B221134-DUP1 and B221134-DUP3. In each case, secondary criteria met (i.e., average result $\leq 5x$ the MRL and results within $2x$ the MRL of each other). No qualification of data was necessary.

Total Recoverable Se (EPA 3050b MOD)

An aliquot of each solid was digested via modified EPA Method 3050B, using additions of concentrated nitric acid, hydrogen peroxide, and hydrochloric acid. The resulting digests were analyzed for Se content via inductively coupled plasma triple quadrupole mass spectrometry (ICP-QQQ-MS). The ICP-QQQ-MS instrumentation uses advanced interference removal techniques to ensure accuracy of the sample results. For more information, please visit the *Interference Reduction Technology* section on our website, brooksapplied.com.

Batch B221186 (Total Recoverable Se)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the Sample Results page for sample-specific MDLs, MRLs, and other details.

Percent Total Solids (SOP BAL-0501)

An aliquot of each solid was measured into a pre-weighed vessel, dried in an oven at 105°C overnight, weighed again, and the percent of dried solid material was calculated.

Batch B221142 (%TS)

%TS results were used to dry-weight correct results for the remaining analytical parameters.

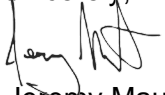

In instances when a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample concentration, the recoveries and the RPD were not considered valid indicators of data quality. In such instances, the recoveries of the blank spikes (BS) and/or standard reference materials (SRM) demonstrate the accuracy of the applied methods. When the spiking level was less than 25% of the native sample concentration, the spike recovery was not reported (NR) and the RPD of the MS/MSD set was not calculated (N/C).

Except for concentration qualifiers, all data were reported without qualification. All associated quality control sample results met the acceptance criteria.

BAL, an accredited laboratory, certifies that the reported results of all analyses for which BAL is NELAP accredited meet all NELAP requirements. For more information, please see the Report Information page.

Please feel free to contact us if you have any questions regarding this report.

Sincerely,

A handwritten signature in black ink, appearing to read 'Jeremy Maute', written over a thin horizontal line.

Report Information

Laboratory Accreditation

BAL is accredited by the *National Environmental Laboratory Accreditation Program* (NELAP) through the State of Florida Department of Health, Bureau of Laboratories (E87982) and is certified to perform many environmental analyses. BAL is also certified by many other states to perform environmental analyses. For a current list of our accreditations/certifications, please visit our website at <http://www.brooksapplied.com/resources/certificates-permits/> or review Tables 1 and 2 in our Accreditation Information. Results reported relate only to the samples listed in the report.

Field Quality Control Samples

Please be notified that certain EPA methods require the collection of field quality control samples of an appropriate type and frequency; failure to do so is considered a deviation from some methods and for compliance purposes should only be done with the approval of regulatory authorities. Please see the specific EPA methods for details regarding required field quality control samples.

Common Abbreviations

AR	as received	MS	matrix spike
BAL	Brooks Applied Labs	MSD	matrix spike duplicate
BLK	method blank	ND	non-detect
BS	blank spike	NR	non-reportable
CAL	calibration standard	N/C	not calculated
CCB	continuing calibration blank	PS	post preparation spike
CCV	continuing calibration verification	REC	percent recovery
COC	chain of custody record	RPD	relative percent difference
D	dissolved fraction	SCV	secondary calibration verification
DUP	duplicate	SOP	standard operating procedure
IBL	instrument blank	SRM	reference material
ICV	initial calibration verification	T	total fraction
MDL	method detection limit	TR	total recoverable fraction
MRL	method reporting limit		

Definition of Data Qualifiers

(Effective 3/23/2020)

E	An estimated value due to the presence of interferences. A full explanation is presented in the narrative.
H	Holding time and/or preservation requirements not met. Please see narrative for explanation.
J	Detected by the instrument, the result is > the MDL but ≤ the MRL. Result is reported and considered an estimate.
J-1	Estimated value. A full explanation is presented in the narrative.
M	Duplicate precision (RPD) was not within acceptance criteria. Please see narrative for explanation.
N	Spike recovery was not within acceptance criteria. Please see narrative for explanation.
R	Rejected, unusable value. A full explanation is presented in the narrative.
U	Result is ≤ the MDL or client requested reporting limit (CRRL). Result reported as the MDL or CRRL.
X	Result is not BLK-corrected and is within 10x the absolute value of the highest detectable BLK in the batch. Result is estimated.
Z	Holding time and/or preservation requirements not established for this method; however, BAL recommendations for holding time were not followed. Please see narrative for explanation.

These qualifiers are based on those previously utilized by Brooks Applied Labs, those found in the EPA SOW ILM03.0, Exhibit B, Section III, pg. B-18, and the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review; USEPA; January 2010. These supersede all previous qualifiers ever employed by BAL.

Hi Jeremy,

Can you please use F2_ECF as the location. If that doesn't work, please just email the results and we can figure out how to get it in the data base on the back end.

Thanks,
Mike

[External email]

Analyses/review are not yet completed for work order 2205262. I am looking over the data that is available and I noticed something that may need to be addressed.

This is for the analyses on the sediment samples (selenium SSE). For work order 2205262, the COC form indicates that results should be uploaded into the EQUIS database (see attached COC form). The last sample on this COC form (*SRF_OUTFALL_BOX_WS_2022-05-12_NP, 05/12/2022 13:00*) does not have a **(sys_loc_code)** value provided on the COC form. Is this going to prevent this sample from a successful upload in the EQUIS database? Furthermore, I am unsure if this sample (*SRF_OUTFALL_BOX_WS_2022-05-12_NP, 05/12/2022 13:00*) has the correct naming structure for upload into the EQUIS database. Could you look into this for me? Are we going to be able to upload this sample into the EQUIS database?

Regards,

Jeremy Maute

Subject: Brooks Samples Received - WOs (2205256, 2205262) F2 SRF FST - Privileged and Confidential

Good afternoon,

This is confirmation that samples from the **FSF** project were received at Brooks Applied Labs on May 19, 2022. Samples were received in acceptable condition.

The samples derive from the same chain of custody (COC) form. However, the samples were logged into two distinct work orders. The water samples were logged into work order 2205256 under the project **TRL-VC1706**. The sediments were logged into work order 2205262 under project **TRL-VC2201**. Some of the sediments were very wet and the water overlaying the sediments in the containers was decanted before the sediments were stored frozen.

The samples were logged in for the following turnaround times (TATs):

WO#2205256 – (5-9 business day) TAT

WO#2205262 – (15 business day) TAT

I've attached copies of the COC forms. Feel free to contact us with any questions.

Regards,

Jeremy Maute

Re: Regional effects program

Dear Mike Pope,

On July 7, 2022, Brooks Applied Labs (BAL) received thirty-six (36) solid samples at an acceptable temperature of -0.8 °C.

Date/Time Collected values listed on the chain-of-custody (COC) forms did not exactly match the corresponding **Date/Time Collected** values on the container labels for several samples in this work order. The discrepancies are described in the table below.

Date/Time Collected Discrepancies

Laboratory ID	Sample ID	Date/Time Collected (on COC form)	Date/Time Collected (on container label)
2207064-09	RG_ERCKMD_SE-1_LAEMP_EVO_2022-06_29_NP	06/29/22 08:00	06/29/22 11:11
2207064-10	RG_ERCKMD_SE-2_LAEMP_EVO_2022-06_29_NP	06/29/22 08:05	06/29/22 11:05
2207064-11	RG_ERCKMD_SE-3_LAEMP_EVO_2022-06_29_NP	06/29/22 08:10	06/29/22 11:10
2207064-12	RG_ERCKMD_BRYOSE-1_LAEMP_EVO_2022-06_29_NP	06/29/22 08:25	06/29/22 11:00
2207064-13	RG_ERCKMD_BRYOSE-2_LAEMP_EVO_2022-06_29_NP	06/29/22 08:30	06/29/22 11:05
2207064-19	RG_ERCKDT_SE-2_LAEMP_EVO_2022-06_29_NP	06/29/22 08:05	06/29/22 11:45
2207064-20	RG_ERCKDT_SE-3_LAEMP_EVO_2022-06_29_NP	06/29/22 08:10	06/29/22 14:30
2207064-22	RG_ERCKDT_SE-5_LAEMP_EVO_2022-06_29_NP	06/29/22 08:20	06/29/22 14:30

2207064-28	RG_ERCKDT_BRYOSE-1_LAEMP_EVO_2022-06_29_NP	06/29/22 08:25	06/29/22 13:30
2207064-30	RG_ERCKDT_BRYOSE-3_LAEMP_EVO_2022-06_29_NP	06/29/22 08:35	06/29/22 11:35

Per client request, samples in the table above were logged in using the **Date/Time Collected** values listed on the COC form (column 3 in the table above).

Upon receipt, laboratory staff at Brooks Applied Labs (BAL) noted that sample *RG_ERCKUC_SE-3_LAEMP_EVO_2022-06_30_NP* (06/30/2022 08:10, laboratory ID = 2207064-27) had a cracked lid. The material from 2207064-27 was transferred into a new container with a clean, undamaged lid. Due to the improper sample storage during shipment to BAL, results for this sample are qualified as estimated (**J-1**).

Each solid sample was logged-in for the analysis of total recoverable Se, Se sequential extraction, and total solids.

Some of the sediments were very wet and the water overlaying the sediments in the containers was decanted before the sediments were stored frozen. After receipt, all solid samples were stored in accordance with BAL SOPs.

Se Selective Sequential Extraction (SSE)

An aliquot of each solid was extracted in accordance with BAL's in-house five-step selective sequential extraction for Se. The samples were extracted with a series of reagents designed to target the following fractions:

SSE Fraction	Fraction Description
F1	Se present as salt (e.g., SeO_4^{-2} , MeSe(IV) , SeCN)
F2	Weakly adsorbed Se (e.g., SeO_4^{-2} , SeO_3^{-2} , SeCN , MeSe(IV))
F3	Amorphous and crystalline Se (e.g., S_2Se , Se^0)
F4	Selenides (e.g., HgSe , PbSe , CdSe , ZnSe)
F5	Residual Se

All resulting SSE fractions were directly analyzed for Se via inductively coupled plasma triple quadrupole mass spectrometry (ICP-QQQ-MS) and have been reported as Se(F1), Se(F2), Se(F3), Se(F4), and Se(F5) according to the corresponding extraction step (see table above).

Batch B221601 (SSE F1)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

Batch B221616 (SSE F2)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

Batch B221636 (SSE F3)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the Sample Results page for sample-specific MDLs, MRLs, and other details.

Batch B221646 (SSE F4)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

Batch B221656 (SSE F5)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the Sample Results page for sample-specific MDLs, MRLs, and other details.

Se Speciation for the SSE

Fractions F1 and F2 of the SSE were also analyzed for individual Se species via ion chromatography inductively coupled plasma collision reaction cell mass spectrometry (IC-ICP-CRC-MS). Selenium species were chromatographically separated on an ion exchange column and then quantified using inductively coupled plasma collision reaction cell mass spectrometry (ICP-CRC-MS); for more information on this determinative technique, please visit the *Interference Reduction Technology* section on our website. The chromatographic method applied for the analyses provides greater retention of methylseleninic acid and selenomethionine, allowing for more definitive quantitation of these species.

Selenium speciation for these SSE fractions was defined as dissolved selenite [*Se(IV)*], selenate [*Se(VI)*], selenocyanate [*SeCN*], methylseleninic acid [*MeSe(IV)*], selenomethionine [*SeMet*], selenosulfate [*SeSO₃*], and dimethylselenoxide [*DMSeO*]. Methaneselenonic acid [*MeSe(VI)*] is reported under *Se Unk A*. The total concentration of any remaining unidentified Se-containing species detected in each sample has also been reported as [*Unk Se Sp*].

DMS₂SeO elutes early in the chromatographic run due to the nature of the molecule and the applied chromatographic separation method. Since this species elutes near the dead volume, additional Se species may coelute. Alternate methods can be applied, upon client request, to increase the separation of DMS₂SeO from potentially co-eluting Se species.

Batch B221521 (Selenium Speciation on SSE F1)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the Sample Results page for sample-specific MDLs, MRLs, and other details.

Batch B221522 (Selenium Speciation on SSE F2)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the Sample Results page for sample-specific MDLs, MRLs, and other details.

Chromatographic interference, as indicated by an elevated baseline, or co-eluting peak, was observed for selenomethionine in 2207064-04, 2207064-22, and 2207064-26. An elevated baseline, or co-eluting peak, was observed where methaneselenonic acid [*MeSe(VI)*] elutes in samples 2207064-04, 2207064-22, and 2207064-40. Due to potential bias, the affected data have been qualified as estimated (**J-1**).

Total Recoverable Se (EPA 3050b MOD)

An aliquot of each solid was digested via modified EPA Method 3050B, using additions of concentrated nitric acid, hydrogen peroxide, and hydrochloric acid. The resulting digests were analyzed for Se content via inductively coupled plasma triple quadrupole mass spectrometry (ICP-QQQ-MS). The ICP-QQQ-MS instrumentation uses advanced interference removal techniques to ensure accuracy of the sample results. For more information, please visit the *Interference Reduction Technology* section on our website, brooksapplied.com.

Batch B221655 (Total Recoverable Se)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the Sample Results page for sample-specific MDLs, MRLs, and other details.

Percent Total Solids (SOP BAL-0501)

An aliquot of each solid was measured into a pre-weighed vessel, dried in an oven at 105°C overnight, weighed again, and the percent of dried solid material was calculated.

Batch B221754 (%TS)

%TS results were used to dry-weight correct results for the remaining analytical parameters.

In instances when a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample concentration, the recoveries and the RPD were not considered valid indicators of data quality. In such instances, the recoveries of the blank spikes (BS) and/or standard reference materials (SRM) demonstrate the accuracy of the applied methods. When the spiking level was less than 25% of the native sample concentration, the spike recovery was not reported (NR) and the RPD of the MS/MSD set was not calculated (N/C).

Except for concentration qualifiers, all data were reported without qualification. All associated quality control sample results met the acceptance criteria.

BAL, an accredited laboratory, certifies that the reported results of all analyses for which BAL is NELAP accredited meet all NELAP requirements. For more information, please see the Report Information page.

Please feel free to contact us if you have any questions regarding this report.

Sincerely,

Jeremy Maute
Senior Project Manager
Jeremy@brooksapplied.com

Report Information

Laboratory Accreditation

BAL is accredited by the *National Environmental Laboratory Accreditation Program* (NELAP) through the State of Florida Department of Health, Bureau of Laboratories (E87982) and is certified to perform many environmental analyses. BAL is also certified by many other states to perform environmental analyses. For a current list of our accreditations/certifications, please visit our website at <http://www.brooksapplied.com/resources/certificates-permits/> or review Tables 1 and 2 in our Accreditation Information. Results reported relate only to the samples listed in the report.

Field Quality Control Samples

Please be notified that certain EPA methods require the collection of field quality control samples of an appropriate type and frequency; failure to do so is considered a deviation from some methods and for compliance purposes should only be done with the approval of regulatory authorities. Please see the specific EPA methods for details regarding required field quality control samples.

Common Abbreviations

AR	as received	MS	matrix spike
BAL	Brooks Applied Labs	MSD	matrix spike duplicate
BLK	method blank	ND	non-detect
BS	blank spike	NR	non-reportable
CAL	calibration standard	N/C	not calculated
CCB	continuing calibration blank	PS	post preparation spike
CCV	continuing calibration verification	REC	percent recovery
COC	chain of custody record	RPD	relative percent difference
D	dissolved fraction	SCV	secondary calibration verification
DUP	duplicate	SOP	standard operating procedure
IBL	instrument blank	SRM	reference material
ICV	initial calibration verification	T	total fraction
MDL	method detection limit	TR	total recoverable fraction
MRL	method reporting limit		

Definition of Data Qualifiers

(Effective 3/23/2020)

E	An estimated value due to the presence of interferences. A full explanation is presented in the narrative.
H	Holding time and/or preservation requirements not met. Please see narrative for explanation.
J	Detected by the instrument, the result is > the MDL but ≤ the MRL. Result is reported and considered an estimate.
J-1	Estimated value. A full explanation is presented in the narrative.
M	Duplicate precision (RPD) was not within acceptance criteria. Please see narrative for explanation.
N	Spike recovery was not within acceptance criteria. Please see narrative for explanation.
R	Rejected, unusable value. A full explanation is presented in the narrative.
U	Result is ≤ the MDL or client requested reporting limit (CRRL). Result reported as the MDL or CRRL.
X	Result is not BLK-corrected and is within 10x the absolute value of the highest detectable BLK in the batch. Result is estimated.
Z	Holding time and/or preservation requirements not established for this method; however, BAL recommendations for holding time were not followed. Please see narrative for explanation.

These qualifiers are based on those previously utilized by Brooks Applied Labs, those found in the EPA SOW ILM03.0, Exhibit B, Section III, pg. B-18, and the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review; USEPA; January 2010. These supersede all previous qualifiers ever employed by BAL.

Subject: Brooks Samples Received - WO (2207064) REP - Privileged and Confidential
Importance: High

Good afternoon,

I apologize. A confirmation of sample reception email was not sent out for this item initially. This is confirmation that samples from the REP project were received at Brooks Applied Labs on July 7, 2022. The samples were logged in for the following turnaround time (TAT):

WO#2207064 – (15-19 business days) TAT

- Please note that we are prioritizing these analyses and we will make every effort to report ASAP

Date/Time Collected values listed on the chain-of-custody (COC) form did not exactly match the corresponding **Date/Time Collected** values on the container labels for several samples in this work order. The discrepancies are described in the table below.

Date/Time Collected Discrepancies

Laboratory ID	Sample ID	Date/Time Collected (on COC form)	Date/Time Collected (on container label)

2207064-09	RG_ERCKMD_SE-1_LAEMP_EVO_2022-06_29_NP	06/29/22 08:00	06/29/22 11:11
2207064-10	RG_ERCKMD_SE-2_LAEMP_EVO_2022-06_29_NP	06/29/22 08:05	06/29/22 11:05
2207064-11	RG_ERCKMD_SE-3_LAEMP_EVO_2022-06_29_NP	06/29/22 08:10	06/29/22 11:10
2207064-12	RG_ERCKMD_BRYOSE-1_LAEMP_EVO_2022-06_29_NP	06/29/22 08:25	06/29/22 11:00
2207064-13	RG_ERCKMD_BRYOSE-2_LAEMP_EVO_2022-06_29_NP	06/29/22 08:30	06/29/22 11:05
2207064-19	RG_ERCKDT_SE-2_LAEMP_EVO_2022-06_29_NP	06/29/22 08:05	06/29/22 11:45
2207064-20	RG_ERCKDT_SE-3_LAEMP_EVO_2022-06_29_NP	06/29/22 08:10	06/29/22 14:30
2207064-22	RG_ERCKDT_SE-5_LAEMP_EVO_2022-06_29_NP	06/29/22 08:20	06/29/22 14:30
2207064-28	RG_ERCKDT_BRYOSE-1_LAEMP_EVO_2022-06_29_NP	06/29/22 08:25	06/29/22 13:30
2207064-30	RG_ERCKDT_BRYOSE-3_LAEMP_EVO_2022-06_29_NP	06/29/22 08:35	06/29/22 11:35

Samples in the table above were logged in using the **Date/Time Collected** values listed on the COC form (column 3 in the table above). **Please let us know if you would have us do otherwise.**

Upon receipt, laboratory staff at Brooks Applied Labs (BAL) noted that sample *RG_ERCKUC_SE-3_LAEMP_EVO_2022-06_30_NP* (06/30/2022 08:10, laboratory ID = 2207064-27) had a cracked lid. The material from 2207064-27 was transferred into a new container with a clean, undamaged lid. Due to the improper sample storage during shipment to BAL, results for this sample will be qualified as estimated (**J-1**).

I've attached copies of the COC forms. If you have any questions, please contact the project manager, Jeremy Maute.

Regards,

Jeremy Maute

Re: Regional effects program

Revision 1

Following the submission of the original report on September 22, 2022, a revised report was requested. Revised chain-of-custody (COC) forms were provided via email. BAL was instructed to use the corrected **Sample ID** values (on the revised COC forms) for reporting. In this revised report, **Sample ID** values were amended for reporting, in accordance with the revised COC forms. No other changes were made with respect to the initial report submitted.

Dear Mike Pope,

On August 4, 2022, Brooks Applied Labs (BAL) received forty-one (41) solid samples at an acceptable temperature of 4.4 °C.

COC forms were received with the shipment, and client samples were initially logged in using the **Sample ID** values on this set of COC forms. Revised chain-of-custody (COC) forms were subsequently provided via email. BAL was instructed to use the corrected **Sample ID** values (on the revised COC forms) for reporting. In order to document sample custody, both sets of COC forms are included in this report.

Each solid sample was logged-in for the analysis of total recoverable Se, Se sequential extraction, and total solids.

The sediments were wet and the water overlaying the sediments in the containers was decanted before the sediments were stored frozen. After receipt, all solid samples were stored in accordance with BAL SOPs.

Total Recoverable Se (EPA 3050b MOD)

An aliquot of each solid was digested via modified EPA Method 3050B, using additions of concentrated nitric acid, hydrogen peroxide, and hydrochloric acid. The resulting digests were analyzed for Se content via inductively coupled plasma triple quadrupole mass spectrometry (ICP-QQQ-MS). The ICP-QQQ-MS instrumentation uses advanced interference removal techniques to ensure accuracy of the sample results. For more information, please visit the *Interference Reduction Technology* section on our website, brooksapplied.com.

Batch B221842 (Total Recoverable Se)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the Sample Results page for sample-specific MDLs, MRLs, and other details.

Poor mass balance was observed in several samples (2208060-02, 2208060-12, 2208060-15, 2208060-25, and 2208060-38) when the total selenium results (EPA 3050b MOD) were compared to the corresponding selenium selective sequential extraction (SSE) results. Re-analyses confirmed the original results, suggesting sample heterogeneity in the sediments. Consequently, no additional corrective actions are necessary. Results for these samples are reported from batch B221842.

Percent Total Solids (SOP BAL-0501)

An aliquot of each solid was measured into a pre-weighed vessel, dried in an oven at 105°C overnight, weighed again, and the percent of dried solid material was calculated.

Batch B221848 (%TS)

%TS results were used to dry-weight correct results for the remaining analytical parameters.

Se Selective Sequential Extraction (SSE)

An aliquot of each solid was extracted in accordance with BAL's in-house five-step selective sequential extraction for Se. The samples were extracted with a series of reagents designed to target the following fractions:

SSE Fraction	Fraction Description
F1	Se present as salt (e.g., SeO_4^{2-} , MeSe(IV) , SeCN)
F2	Weakly adsorbed Se (e.g., SeO_4^{2-} , SeO_3^{2-} , SeCN , MeSe(IV))
F3	Amorphous and crystalline Se (e.g., S_2Se , Se^0)
F4	Selenides (e.g., HgSe , PbSe , CdSe , ZnSe)
F5	Residual Se

All resulting SSE fractions were directly analyzed for Se via inductively coupled plasma triple quadrupole mass spectrometry (ICP-QQQ-MS) and have been reported as Se(F1), Se(F2), Se(F3), Se(F4), and Se(F5) according to the corresponding extraction step (see table above).

Batch B221798 (SSE F1)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

Batch B221808 (SSE F2)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

The relative percent difference (RPD) for selenium (Se(F2)) in the laboratory duplicate sample B221808-DUP3 was greater than the control limit of 25%, at 28%. The (Se(F2)) result for the source sample (2208060-20) should be considered estimated due to poor precision and has been qualified (**M**) to reflect this discrepancy.

Batch B221826 (SSE F3)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the Sample Results page for sample-specific MDLs, MRLs, and other details.

Batch B221830 (SSE F4)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

Batch B221863 (SSE F5)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the Sample Results page for sample-specific MDLs, MRLs, and other details.

Se Speciation for the SSE

Fractions F1 and F2 of the SSE were also analyzed for individual Se species via ion chromatography inductively coupled plasma collision reaction cell mass spectrometry (IC-ICP-CRC-MS). Selenium species were chromatographically separated on an ion exchange column and then quantified using inductively coupled plasma collision reaction cell mass spectrometry (ICP-CRC-MS); for more information on this determinative technique, please visit the *Interference Reduction Technology* section on our website. The chromatographic method applied for the analyses provides greater retention of methylseleninic acid and selenomethionine, allowing for more definitive quantitation of these species.

Selenium speciation for these SSE fractions was defined as dissolved selenite [*Se(IV)*], selenate [*Se(VI)*], selenocyanate [*SeCN*], methylseleninic acid [*MeSe(IV)*], selenomethionine [*SeMet*], selenosulfate [*SeSO₃*], and dimethylselenoxide [*DMSeO*]. Methaneselenonic acid [*MeSe(VI)*] is reported under *Se Unk A*. The total concentration of any remaining unidentified Se-containing species detected in each sample has also been reported as [*Unk Se Sp*].

DMS₂SeO elutes early in the chromatographic run due to the nature of the molecule and the applied chromatographic separation method. Since this species elutes near the dead volume, additional Se species may coelute. Alternate methods can be applied, upon client request, to increase the separation of DMS₂SeO from potentially co-eluting Se species.

Batch B221769 (Selenium Speciation on SSE F1)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the Sample Results page for sample-specific MDLs, MRLs, and other details.

Batch B221770 (Selenium Speciation on SSE F2)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the Sample Results page for sample-specific MDLs, MRLs, and other details.

The RPD values for (*Se(IV) F2*) and (*MeSe(IV) F2*) in the laboratory duplicate sample B221770-DUP1 were greater than the control limit of 25%, at 31% and 66%, respectively. (*Se(IV) F2*) and (*MeSe(IV) F2*) results in the source sample (2208060-02) have been qualified as estimated (**M**) due to poor precision in the laboratory duplicate sample B221770-DUP1.

The RPD values for (*Se(IV) F2*), (*SeCN F2*), and (*MeSe(IV) F2*) in the laboratory duplicate sample B221770-DUP3 were greater than the control limit of 25%, at 29%, 51%, and 55%, respectively. (*Se(IV) F2*), (*SeCN F2*), and (*MeSe(IV) F2*) results in the source sample (2208060-20) have been qualified as estimated (**M**) due to poor precision in the laboratory duplicate sample B221770-DUP3.

Post spikes are employed on SSE samples at the instrument. The post recoveries for (*Se(IV) F2*) and (*SeCN F2*) in B221770-PS2 were greater than upper control limit of 125%, at 127% and 129%, respectively. The *Se(IV) F2*) and (*SeCN F2*) results for the source sample (2208060-02) should be considered estimated and have been qualified (**N**) due to the spike recovery outliers.

In instances when a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample concentration, the recoveries and the RPD were not considered valid indicators of data quality. In such instances, the recoveries of the blank spikes (BS) and/or standard reference materials (SRM) demonstrate the accuracy of the applied methods. When the spiking level was less than 25% of the native sample concentration, the spike recovery was not reported (NR) and the RPD of the MS/MSD set was not calculated (N/C).

Except for concentration qualifiers and items noted above, all data were reported without qualification. Except for the RPD and post spike recovery outliers described above, all associated quality control sample results met the acceptance criteria.

BAL verifies that the reported results of all analyses for which the laboratory is accredited meet the requirements of the accrediting body, unless otherwise noted in the report narrative. For more information regarding accreditations please see the *Report Information* and *Batch Summary* pages. This report must be used in its entirety for interpretation of results.

Please feel free to contact us if you have any questions regarding this report.

Sincerely,

Jeremy Maute
Senior Project Manager
Jeremy@brooksapplied.com

Report Information

Laboratory Accreditation

BAL is accredited by the *National Environmental Laboratory Accreditation Program* (NELAP) through the State of Florida Department of Health, Bureau of Laboratories (E87982) and is certified to perform many environmental analyses. BAL is also certified by many other states to perform environmental analyses. For a current list of our accreditations/certifications, please visit our website at <http://www.brooksapplied.com/resources/certificates-permits/> or review Tables 1 and 2 in our Accreditation Information. Results reported relate only to the samples listed in the report.

Field Quality Control Samples

Please be notified that certain EPA methods require the collection of field quality control samples of an appropriate type and frequency; failure to do so is considered a deviation from some methods and for compliance purposes should only be done with the approval of regulatory authorities. Please see the specific EPA methods for details regarding required field quality control samples.

Common Abbreviations

AR	as received	MS	matrix spike
BAL	Brooks Applied Labs	MSD	matrix spike duplicate
BLK	method blank	ND	non-detect
BS	blank spike	NR	non-reportable
CAL	calibration standard	N/C	not calculated
CCB	continuing calibration blank	PS	post preparation spike
CCV	continuing calibration verification	REC	percent recovery
COC	chain of custody record	RPD	relative percent difference
D	dissolved fraction	SCV	secondary calibration verification
DUP	duplicate	SOP	standard operating procedure
IBL	instrument blank	SRM	reference material
ICV	initial calibration verification	T	total fraction
MDL	method detection limit	TR	total recoverable fraction
MRL	method reporting limit		

Definition of Data Qualifiers

(Effective 3/23/2020)

E	An estimated value due to the presence of interferences. A full explanation is presented in the narrative.
H	Holding time and/or preservation requirements not met. Please see narrative for explanation.
J	Detected by the instrument, the result is > the MDL but ≤ the MRL. Result is reported and considered an estimate.
J-1	Estimated value. A full explanation is presented in the narrative.
M	Duplicate precision (RPD) was not within acceptance criteria. Please see narrative for explanation.
N	Spike recovery was not within acceptance criteria. Please see narrative for explanation.
R	Rejected, unusable value. A full explanation is presented in the narrative.
U	Result is ≤ the MDL or client requested reporting limit (CRRL). Result reported as the MDL or CRRL.
X	Result is not BLK-corrected and is within 10x the absolute value of the highest detectable BLK in the batch. Result is estimated.
Z	Holding time and/or preservation requirements not established for this method; however, BAL recommendations for holding time were not followed. Please see narrative for explanation.

These qualifiers are based on those previously utilized by Brooks Applied Labs, those found in the EPA SOW ILM03.0, Exhibit B, Section III, pg. B-18, and the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review; USEPA; January 2010. These supersede all previous qualifiers ever employed by BAL.

NOTICE OF CLAIM: (a) No carrier is liable for loss, damage or delay of any goods under the Bill of Lading unless notice, therefore setting out particulars of the origin, destination and date of shipment of the goods and the estimated amount claimed, is received by the carrier within sixty (60) days after the delivery of the goods, or in the case of failure to make delivery within nine (9) months from the date of shipment. (b) The final statement of the claim must be filed within nine (9) months from the date of shipment together with a copy of the paid freight bill. (c) The point of origin on the date specified from the consignor mentioned herein, the property herein described in apparent good order, except as noted (contents and condition of contents of package unknown) marked consigned and destined as indicated below, which the carrier agrees to carry and to deliver to the consignee at the said destination, subject to the rates and classification in effect on the date of shipment. It is mutually agreed, as to each carrier of all or any of the goods over all or any portion of the route to destination, and as to each party of any time interested in all or any of the goods, that every service to be performed hereunder shall be subject to the conditions standard Bill of Lading, in power at the date of issuing, which are hereby agreed by the consignor and accepted for himself and his assigns. Printed or written including conditions set aside by the standard Bill of Lading, in power at the date of issuing, which are hereby agreed by the consignor and accepted for himself and his assigns. The Contract for the carriage of the goods listed in the Bill of Lading is governed by regulation in force in the jurisdiction at the time and place of shipment and is subject to the conditions set out in such conditions.

Hi Jeremy,

We would like the following reports reissued with new samples names:

- o 2208060
- o 2206053
- o 2206057

Please see the attached COCs with new sample names.

Thank you,
Hillary

Re: Regional Effects Program

Dear Mike Pope,

On October 6, 2022, Brooks Applied Labs (BAL) received ninety (90) solid samples at an acceptable temperature of -2.5 °C.

The sediment fractions described in the table below were not present in the sample shipment. These items were described on the associated COC forms with requested analyses.

Sample Fractions Not Present in Sample Shipment

Laboratory ID	Sample ID	Date/Time Collected
2210048-04	RG_FOUKI_SESeSp-3_2022-09-13_N	09/13/2022 10:45
2210048-14	RG_SCOUTDS_SESeSp-2_2022-09-14_N	09/14/2022 09:20

BAL will be unable to report results for 2210048-04 and 2210048-14.

The client made a request to amend the field ID for 2210048-52. Since the field ID listed on the COC form is not used for reporting 2210048-52, please refer to the **Sample ID** cross reference table for identification.

Sample ID Cross Reference Table

Laboratory ID	Sample ID (on COC form)	Sample ID used for Reporting (per client request)
2210048-52	RG_MICOMP_SESeSp-52022-09-18_N	RG_MICOMP_SESeSp-5_2022-09-18_N

Each solid sample was logged-in for the analysis of total recoverable Se, Se sequential extraction, and total solids.

The sediments were wet and the water overlaying the sediments in the containers was decanted before the sediments were stored frozen. After receipt, all solid samples were stored in accordance with BAL SOPs.

Percent Total Solids (SOP BAL-0501)

An aliquot of each solid was measured into a pre-weighed vessel, dried in an oven at 105°C overnight, weighed again, and the percent of dried solid material was calculated.

Batch B222342 (%TS)

%TS results were used to dry-weight correct results for the remaining analytical parameters.

Batch B222353 (%TS)

%TS results were used to dry-weight correct results for the remaining analytical parameters.

Batch B222355 (%TS)

%TS results were used to dry-weight correct results for the remaining analytical parameters.

Total Recoverable Se (EPA 3050b MOD)

An aliquot of each solid was digested via modified EPA Method 3050B, using additions of concentrated nitric acid, hydrogen peroxide, and hydrochloric acid. The resulting digests were analyzed for Se content via inductively coupled plasma triple quadrupole mass spectrometry (ICP-QQQ-MS). The ICP-QQQ-MS instrumentation uses advanced interference removal techniques to ensure accuracy of the sample results. For more information, please visit the *Interference Reduction Technology* section on our website, brooksapplied.com.

Poor mass balance was observed in several samples when the total selenium results (EPA 3050b MOD) were compared to the corresponding selenium selective sequential extraction (SSE) results. Re-analyses confirmed original results, suggesting sample heterogeneity in the sediments. Consequently, no additional corrective actions are necessary. Results for these samples are reported from batches B222340, B222344, B222380, and B222504.

Batch B222340 (Total Recoverable Se)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the Sample Results page for sample-specific MDLs, MRLs, and other details.

Batch B222344 (Total Recoverable Se)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the Sample Results page for sample-specific MDLs, MRLs, and other details.

Batch B222380 (Total Recoverable Se)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the Sample Results page for sample-specific MDLs, MRLs, and other details.

Batch B222504 (Total Recoverable Se)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the Sample Results page for sample-specific MDLs, MRLs, and other details.

Se Selective Sequential Extraction (SSE)

An aliquot of each solid was extracted in accordance with BAL's in-house five-step selective sequential extraction for Se. The samples were extracted with a series of reagents designed to target the following fractions:

SSE Fraction	Fraction Description
F1	Se present as salt (e.g., SeO_4^{-2} , MeSe(IV) , SeCN)
F2	Weakly adsorbed Se (e.g., SeO_4^{-2} , SeO_3^{-2} , SeCN , MeSe(IV))
F3	Amorphous and crystalline Se (e.g., S_2Se , Se^0)
F4	Selenides (e.g., HgSe , PbSe , CdSe , ZnSe)
F5	Residual Se

All resulting SSE fractions were directly analyzed for Se via inductively coupled plasma triple quadrupole mass spectrometry (ICP-QQQ-MS) and have been reported as Se(F1), Se(F2), Se(F3), Se(F4), and Se(F5) according to the corresponding extraction step (see table above).

Batch B222330 (SSE F1)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

Batch B222332 (SSE F1)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

Batch B222333 (SSE F1)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

Batch B222399 (SSE F2)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

Batch B222400 (SSE F2)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

Batch B222434 (SSE F2)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

The relative percent difference (RPD) for selenium (Se(F2)) in the laboratory duplicate sample B222434-DUP2 was greater than the control limit of 25%, at 30%. The (Se(F2)) result for the source sample

(2210048-80) should be considered estimated due to poor precision and has been qualified (**M**) to reflect this discrepancy.

Batch B222405 (SSE F3)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

The relative percent difference (RPD) for selenium ($Se(F3)$) in the laboratory duplicate sample B222405-DUP1 was greater than the control limit of 25%, at 29%. Secondary criteria were met (*i.e.*, *avg result* $\leq 5x$ the MRL and results within two MRL values). No qualification of data was necessary.

Batch B222438 (SSE F3)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

Batch B222498 (SSE F3)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

Batch B222421 (SSE F4)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

The relative percent difference (RPD) for selenium ($Se(F4)$) in the laboratory duplicate B222421-DUP3 was greater than the control limit of 25%, at 115%. The ($Se(F4)$) result for the source sample (2210048-27) should be considered estimated due to poor precision and has been qualified (**M**).

Batch B222485 (SSE F4)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

The RPD for selenium ($Se(F4)$) in the laboratory duplicate B222485-DUP3 was greater than the control limit of 25%, at 27%. Secondary criteria were met (*i.e.*, *avg result* $\leq 5x$ the MRL and results within two MRL values). No qualification of data was necessary.

Batch B222514 (SSE F4)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

The RPD for selenium ($Se(F4)$) in the laboratory duplicate B222514-DUP2 was greater than the control limit of 25%, at 36%. Secondary criteria were met (*i.e.*, *avg result* $\leq 5x$ the MRL and results within two MRL values). No qualification of data was necessary.

Batch B222447 (SSE F5)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

Batch B222495 (SSE F5)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

Batch B222533 (SSE F5)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

Se Speciation for the SSE

Fractions F1 and F2 of the SSE were also analyzed for individual Se species via ion chromatography inductively coupled plasma collision reaction cell mass spectrometry (IC-ICP-CRC-MS). Selenium species were chromatographically separated on an ion exchange column and then quantified using inductively coupled plasma collision reaction cell mass spectrometry (ICP-CRC-MS); for more information on this determinative technique, please visit the *Interference Reduction Technology* section on our website. The chromatographic method applied for the analyses provides greater retention of methylseleninic acid and selenomethionine, allowing for more definitive quantitation of these species.

Selenium speciation for these SSE fractions was defined as dissolved selenite [*Se(IV)*], selenate [*Se(VI)*], selenocyanate [*SeCN*], methylseleninic acid [*MeSe(IV)*], selenomethionine [*SeMet*], selenosulfate [*SeSO₃*], and dimethylselenoxide [*DMSeO*]. Methaneselenonic acid [*MeSe(VI)*] is reported under *Se Unk A*. The total concentration of any remaining unidentified Se-containing species detected in each sample has also been reported as [*Unk Se Sp*].

DMS₂SeO elutes early in the chromatographic run due to the nature of the molecule and the applied chromatographic separation method. Since this species elutes near the dead volume, additional Se species may coelute. Alternate methods can be applied, upon client request, to increase the separation of DMS₂SeO from potentially co-eluting Se species.

Batch B222343 (Selenium Speciation on SSE F1)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

Batch B222345 (Selenium Speciation on SSE F1)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

Batch B222346 (Selenium Speciation on SSE F1)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

Batch B222348 (Selenium Speciation on SSE F2)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the Sample Results page for sample-specific MDLs, MRLs, and other details.

Batch B222350 (Selenium Speciation on SSE F2)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the Sample Results page for sample-specific MDLs, MRLs, and other details.

Chromatographic interference, as indicated by an elevated baseline, or co-eluting peak, was observed for methylseleninic acid [*MeSe(IV)*] in 2210048-50. Due to potential bias, the affected result has been qualified as estimated (**J-1**).

Batch B222351 (Selenium Speciation on SSE F2)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the Sample Results page for sample-specific MDLs, MRLs, and other details.

The relative percent difference (RPD) for selenium (*MeSe(IV) F2*) in the laboratory duplicate B222351-DUP2 was greater than the control limit of 25%, at 43%. The (*MeSe(IV) F2*) result for the source sample (2210048-80) should be considered estimated due to poor precision and has been qualified (**M**).

In instances when a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample concentration, the recoveries and the RPD were not considered valid indicators of data quality. In such instances, the recoveries of the blank spikes (BS) and/or standard reference materials (SRM) demonstrate the accuracy of the applied methods. When the spiking level was less than 25% of the native sample concentration, the spike recovery was not reported (NR) and the RPD of the MS/MSD set was not calculated (N/C).

Except for concentration qualifiers and items noted above, all data were reported without qualification. Except for the RPD outliers described above, all associated quality control sample results met the acceptance criteria.

BAL verifies that the reported results of all analyses for which the laboratory is accredited meet the requirements of the accrediting body, unless otherwise noted in the report narrative. For more information regarding accreditations please see the *Report Information* and *Batch Summary* pages. This report must be used in its entirety for interpretation of results.

Please feel free to contact us if you have any questions regarding this report.

Sincerely,

Jeremy Maute
Senior Project Manager
Jeremy@brooksapplied.com

Report Information

General Disclaimers

Test results are based solely upon the sample submitted to Brooks Applied Labs in the condition it was received. This report shall not be reproduced or copied, except in full, without written approval of the laboratory. Brooks Applied Labs is not responsible for the consequences arising from the use of a partial report.

Laboratory Accreditation

BAL maintains accreditation with various state and national agencies for select test methods. For a current list of BAL accreditations, please visit our website at <http://www.brooksapplied.com/resources/certificates-permits/>. The reported analyte/matrix/method combination shall be considered outside BAL's scopes of accreditation unless otherwise identified as ISO, TNI, or ISO,TNI in the tables. It is the responsibility of the client to verify whether a specific accreditation is required for the intended data use.

ISO: ISO/IEC 17025:2017 accredited test method. Issued by ANSI National Accreditation Board (ANAB), #ADE-1447.02

TNI: NELAP accredited test method. Issued by the State of Florida Department of Health, #E87982.

ISO,TNI: Test method is accredited under both the ISO/IEC 17025:2017 and NELAP accreditations referenced above.

Field Quality Control Samples

Please be notified that certain EPA methods require the collection of field quality control samples of an appropriate type and frequency; failure to do so is considered a deviation from some methods and for compliance purposes should only be done with the approval of regulatory authorities. Please see the specific EPA methods for details regarding required field quality control samples.

Common Abbreviations

AR	as received	MS	matrix spike
BAL	Brooks Applied Labs	MSD	matrix spike duplicate
BLK	method blank	ND	non-detect
BS	blank spike	NR	non-reportable
CAL	calibration standard	N/C	not calculated
CCB	continuing calibration blank	PS	post preparation spike
CCV	continuing calibration verification	REC	percent recovery
COC	chain of custody record	RPD	relative percent difference
D	dissolved fraction	SCV	secondary calibration verification
DUP	duplicate	SOP	standard operating procedure
IBL	instrument blank	SRM	reference material
ICV	initial calibration verification	T	total fraction
MDL	method detection limit	TR	total recoverable fraction
MRL	method reporting limit		

Definition of Data Qualifiers

E	An estimated value due to the presence of interferences. A full explanation is presented in the narrative.
H	Holding time and/or preservation requirements not met. Please see narrative for explanation.
J	Detected by the instrument, the result is > the MDL but ≤ the MRL. Result is reported and considered an estimate.
J-1	Estimated value. A full explanation is presented in the narrative.
M	Duplicate precision (RPD) was not within acceptance criteria. Please see narrative for explanation.
N	Spike recovery was not within acceptance criteria. Please see narrative for explanation.
R	Rejected, unusable value. A full explanation is presented in the narrative.
U	Result is ≤ the MDL or client requested reporting limit (CRRL). Result reported as the MDL or CRRL.
X	Result is not BLK-corrected and is within 10x the absolute value of the highest detectable BLK in the batch. Result is estimated.
Z	Holding time and/or preservation requirements not established for this method; however, BAL recommendations for holding time were not followed. Please see narrative for explanation.

NOTICE OF CLAIM: (a) No carrier is liable for loss, damage or delay of any goods under the Bill of Lading unless notice, in writing, setting out particulars of the origin, destination and date of shipment of the goods and the estimated amount claimed in respect of such loss, damage or delay is given in writing to the originating carrier or the delivering carrier within sixty (60) days after the delivery of the goods, or in the case of failure to make delivery, within nine (9) months from the date of shipment. (b) The first stevedore of the claim must be filed within nine (9) months from the date of shipment, together with a copy of the paid freight bill. RECEIVED at the point of origin on the date specified from the consignor mentioned herein, the property herein described in apparent good order, except as noted (contents and condition of packages unexamined) marked, consigned and delivered as indicated below, which the carrier agrees to carry and to deliver to the consignee at the said destination, subject to the rates and classification in effect on the date of shipment. It is mutually agreed, as to each carrier of all or any of the goods, and as to each party of any time interested in all or any of the goods, that every service to be performed hereunder shall be subject to the conditions standard Bill of Lading in power at the date of issuing, which are hereby agreed by the consignor and accepted for himself and his assigns. Printed in reverse, including conditions set aside by the standard Bill of Lading in power at the date of issuing, which are hereby agreed by the consignor and accepted for himself and his assigns. The Contract for the carriage of the goods listed in the Bill of Lading is governed by regulation in force in the jurisdiction at the time and place of shipment and is subject to the conditions set out in such conditions.

NOTICE OF CLAIM: (a) No carrier is liable for loss, damage or delay of any goods under the Bill of Lading unless notice therefor setting out particulars of the origin, destination and date of shipment of the goods and the estimated amount claimed in respect of such loss, damage or delay is given in writing to the originating carrier or the delivering carrier within sixty (60) days after the delivery of the goods, in the case of failure to make delivery, within nine (9) months from the date of shipment. (b) The final statement of the claim must be filed within nine (9) months from the date of shipment together with a copy of the paid freight bill. RECEIVED at the point of origin on the date specified from the consignee mentioned herein, the property herein described in apparent good order, except as noted (contents and condition of container of package unknown), marked, consigned and defined as indicated below, which the carrier agrees to carry and to deliver to the consignee at the said destination subject to the rates and classification in effect on the date of shipment, all the conditions standard Bill of Lading, in power at the date of issuing, which are hereto agreed by the consignor and acceptor for himself and his assigns. Printed or written including conditions set aside by the standard Bill of Lading in power at the date of issuing, which are hereby agreed by the consignee, are accepted for himself and his assigns. The Contract for the carriage of the goods listed in the Bill of Lading is governed by regulation in force in the jurisdiction at the time and place of shipment and is subject to the conditions set out in such conditions.

Re: Regional Effects Program

Dear Mike Pope,

On October 6, 2022, Brooks Applied Labs (BAL) received forty-three (43) solid samples at an acceptable temperature of 0.6 °C.

Date/Time Collected values listed on the chain-of-custody (COC) forms received with the sample shipment did not exactly match the corresponding **Date/Time Collected** values on the container labels for several samples. The discrepancies are described in the table below.

Date/Time Collected Value Agreement Issues

Laboratory ID	Sample ID	Date/Time Collected (on COC form received with the sample shipment)	Date/Time Collected (on container label)
2210049-06	RG_GATE_SESeSp-1_2022-09-15_N	09/15/2022 14:00	09/15/2022 10:00
2210049-07	RG_GATE_SESeSp-2_2022-09-15_N	09/15/2022 14:30	09/15/2022 11:00
2210049-08	RG_GATE_SESeSp-3_2022-09-15_N	09/15/2022 15:00	09/15/2022 12:00
2210049-09	RG_MI25_SESeSp-1_2022-09-15_N	09/15/2022 09:15	09/15/2022 11:25
2210049-10	RG_MI25_SESeSp-2_2022-09-15_N	09/15/2022 09:30	09/15/2022 10:50
2210049-11	RG_MI25_SESeSp-3_2022-09-15_N	09/15/2022 09:45	09/15/2022 09:50
2210049-36	RG_MIDBO_SESeSp-3_2022-09-13_N	09/13/2022 14:15	09/13/2022 15:15

Per client request, the samples described in the table above were logged in using the **Date/Time Collected** values on the container labels (column 4 in the above table).

Each solid sample was logged-in for the analysis of total recoverable Se, Se sequential extraction, and total solids.

The sediments were wet and the water overlaying the sediments in the containers was decanted before the sediments were stored frozen. After receipt, all solid samples were stored in accordance with BAL SOPs.

Percent Total Solids (SOP BAL-0501)

An aliquot of each solid was measured into a pre-weighed vessel, dried in an oven at 105°C overnight, weighed again, and the percentage of dried solid material was calculated.

Batch B222335 (%TS)

%TS results were used to dry-weight correct results for the remaining analytical parameters.

Total Recoverable Se (EPA 3050b MOD)

An aliquot of each solid was digested via modified EPA Method 3050B, using additions of concentrated nitric acid, hydrogen peroxide, and hydrochloric acid. The resulting digests were analyzed for Se content via inductively coupled plasma triple quadrupole mass spectrometry (ICP-QQQ-MS). The ICP-QQQ-MS instrumentation uses advanced interference removal techniques to ensure accuracy of the sample results. For more information, please visit the *Interference Reduction Technology* section on our website, brooksapplied.com.

Batch B222380 (Total Recoverable Se)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the Sample Results page for sample-specific MDLs, MRLs, and other details.

Batch B222388 (Total Recoverable Se)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the Sample Results page for sample-specific MDLs, MRLs, and other details.

Se Selective Sequential Extraction (SSE)

An aliquot of each solid was extracted in accordance with BAL's in-house five-step selective sequential extraction for Se. The samples were extracted with a series of reagents designed to target the following fractions:

SSE Fraction	Fraction Description
F1	Se present as salt (e.g., SeO_4^{2-} , MeSe(IV) , SeCN)
F2	Weakly adsorbed Se (e.g., SeO_4^{2-} , SeO_3^{2-} , SeCN , MeSe(IV))
F3	Amorphous and crystalline Se (e.g., S_2Se , Se^0)
F4	Selenides (e.g., HgSe , PbSe , CdSe , ZnSe)
F5	Residual Se

All resulting SSE fractions were directly analyzed for Se via inductively coupled plasma triple quadrupole mass spectrometry (ICP-QQQ-MS) and have been reported as Se(F1), Se(F2), Se(F3), Se(F4), and Se(F5) according to the corresponding extraction step (see table above).

Batch B222333 (SSE F1)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

Batch B222425 (SSE F1)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

Batch B222434 (SSE F2)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

Batch B222435 (SSE F2)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

The relative percent difference (RPD) for selenium (Se(F2)) in the laboratory duplicate sample B222435-DUP4 was greater than the control limit of 25%, at 27%. Secondary criteria were met (*i.e.*, *avg result* \leq *5x the MRL and results within two MRL values*). No qualification of data was necessary.

Batch B222498 (SSE F3)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

Batch B222530 (SSE F3)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

Batch B222514 (SSE F4)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

Batch B222544 (SSE F4)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

The RPD values for selenium (Se(F4)) were greater than the control limit of 25% in the laboratory duplicate samples B222544-DUP2 and B222544-DUP3. Secondary criteria were met (*i.e.*, *avg result* \leq *5x the MRL and results within two MRL values*). No qualification of data was necessary.

Batch B222533 (SSE F5)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

Batch B222555 (SSE F5)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

The RPD for selenium (*Se(F5)*) in the laboratory duplicate sample B222555-DUP1 was greater than the control limit of 25%, at 38%. Secondary criteria were met (*i.e.*, *avg result* \leq *5x the MRL and results within two MRL values*). No qualification of data was necessary.

Se Speciation for the SSE

Fractions F1 and F2 of the SSE were also analyzed for individual Se species via ion chromatography inductively coupled plasma collision reaction cell mass spectrometry (IC-ICP-CRC-MS). Selenium species were chromatographically separated on an ion exchange column and then quantified using inductively coupled plasma collision reaction cell mass spectrometry (ICP-CRC-MS); for more information on this determinative technique, please visit the *Interference Reduction Technology* section on our website. The chromatographic method applied for the analyses provides greater retention of methylseleninic acid and selenomethionine, allowing for more definitive quantitation of these species.

Selenium speciation for these SSE fractions was defined as dissolved selenite [*Se(IV)*], selenate [*Se(VI)*], selenocyanate [*SeCN*], methylseleninic acid [*MeSe(IV)*], selenomethionine [*SeMet*], selenosulfate [*SeSO₃*], and dimethylselenoxide [*DMeSeO*]. Methaneselenonic acid [*MeSe(VI)*] is reported under *Se Unk A*. The total concentration of any remaining unidentified Se-containing species detected in each sample has also been reported as [*Unk Se Sp*].

DMeSeO elutes early in the chromatographic run due to the nature of the molecule and the applied chromatographic separation method. Since this species elutes near the dead volume, additional Se species may coelute. Alternate methods can be applied, upon client request, to increase the separation of DMeSeO from potentially co-eluting Se species.

Batch B222346 (Selenium Speciation on SSE F1)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

The relative percent difference (RPD) for selenium (*MeSe(IV) F1*) in the laboratory duplicate B222346-DUP4 was greater than the control limit of 25%, at 96%. Secondary criteria were met (*i.e.*, *avg result* \leq *5x the MRL and results within two MRL values*). No qualification of data was necessary.

Batch B222347(Selenium Speciation on SSE F1)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

Post spikes are employed on SSE samples as they are prepared for the instrument in the selenium speciation analytical runs. The post spike recoveries for (*SeCN F1*) in B222347-PS2 (70%), B222347-PS3 (74%), and B222347-PS4 (69%) were less than the lower control limit of 75%. The (*SeCN F1*) results for the source samples (2210049-25, 2210049-33, and 2210049-39, respectively) should be considered estimated, and have been qualified (**N**) due to the spike recovery outliers.

Batch B222351 (Selenium Speciation on SSE F2)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the Sample Results page for sample-specific MDLs, MRLs, and other details.

RPD values for selenium (*MeSe(IV) F2*) were greater than the control limit of 25% in the laboratory duplicate sample B222351-DUP3. Secondary criteria were met (*i.e.*, *avg result* \leq *5x the MRL and results within two MRL values*). No qualification of data was necessary.

Batch B222352 (Selenium Speciation on SSE F2)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the Sample Results page for sample-specific MDLs, MRLs, and other details.

The RPD values for (*Se(IV) F2*), (*SeCN F2*), and (*MeSe(IV) F2*) in the laboratory duplicate B222352-DUP2 were greater than the control limit of 25%, at 34%, 30%, and 47%, respectively. The (*Se(IV) F2*), (*SeCN F2*), and (*MeSe(IV) F2*) results for the source sample (2210049-25) should be considered estimated due to poor precision and have been qualified (**M**).

Chromatographic interference, as indicated by an elevated baseline, or co-eluting peak, was observed for selenomethionine (*SeMet F2*) in 2210049-38. Due to potential bias, the affected result has been qualified as estimated (**J-1**).

In instances when a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample concentration, the recoveries and the RPD were not considered valid indicators of data quality. In such instances, the recoveries of the blank spikes (BS) and/or standard reference materials (SRM) demonstrate the accuracy of the applied methods. When the spiking level was less than 25% of the native sample concentration, the spike recovery was not reported (NR) and the RPD of the MS/MSD set was not calculated (N/C).

Except for concentration qualifiers and items noted above, all data were reported without qualification. Except for the laboratory duplicate RPD outliers and post spike recovery outliers described above, all associated quality control sample results met the acceptance criteria.

BAL verifies that the reported results of all analyses for which the laboratory is accredited meet the requirements of the accrediting body, unless otherwise noted in the report narrative. For more information regarding accreditations please see the *Report Information* and *Batch Summary* pages. This report must be used in its entirety for interpretation of results.

Please feel free to contact us if you have any questions regarding this report.

Sincerely,

Jeremy Maute
Senior Project Manager
Jeremy@brooksapplied.com

Report Information

General Disclaimers

Test results are based solely upon the sample submitted to Brooks Applied Labs in the condition it was received. This report shall not be reproduced or copied, except in full, without written approval of the laboratory. Brooks Applied Labs is not responsible for the consequences arising from the use of a partial report.

Laboratory Accreditation

BAL maintains accreditation with various state and national agencies for select test methods. For a current list of BAL accreditations, please visit our website at <http://www.brooksapplied.com/resources/certificates-permits/>. The reported analyte/matrix/method combination shall be considered outside BAL's scopes of accreditation unless otherwise identified as ISO, TNI, or ISO,TNI in the tables. It is the responsibility of the client to verify whether a specific accreditation is required for the intended data use.

ISO: ISO/IEC 17025:2017 accredited test method. Issued by ANSI National Accreditation Board (ANAB), #ADE-1447.02

TNI: NELAP accredited test method. Issued by the State of Florida Department of Health, #E87982.

ISO,TNI: Test method is accredited under both the ISO/IEC 17025:2017 and NELAP accreditations referenced above.

Field Quality Control Samples

Please be notified that certain EPA methods require the collection of field quality control samples of an appropriate type and frequency; failure to do so is considered a deviation from some methods and for compliance purposes should only be done with the approval of regulatory authorities. Please see the specific EPA methods for details regarding required field quality control samples.

Common Abbreviations

AR	as received	MS	matrix spike
BAL	Brooks Applied Labs	MSD	matrix spike duplicate
BLK	method blank	ND	non-detect
BS	blank spike	NR	non-reportable

Definition of Data Qualifiers

E	An estimated value due to the presence of interferences. A full explanation is presented in the narrative.
H	Holding time and/or preservation requirements not met. Please see narrative for explanation.
J	Detected by the instrument, the result is > the MDL but ≤ the MRL. Result is reported and considered an estimate.
J-1	Estimated value. A full explanation is presented in the narrative.
M	Duplicate precision (RPD) was not within acceptance criteria. Please see narrative for explanation.
N	Spike recovery was not within acceptance criteria. Please see narrative for explanation.
R	Rejected, unusable value. A full explanation is presented in the narrative.
U	Result is ≤ the MDL or client requested reporting limit (CRRL). Result reported as the MDL or CRRL.
X	Result is not BLK-corrected and is within 10x the absolute value of the highest detectable BLK in the batch. Result is estimated.
Z	Holding time and/or preservation requirements not established for this method; however, BAL recommendations for holding time were not followed. Please see narrative for explanation.

NOTICE OF CLAIM: (a) No carrier is liable for loss, damage or delay of any goods under the Bill of Lading unless notice, in writing, setting out particulars of the origin, destination and date of shipment of the goods and the estimated amount claimed in respect of such loss, damage or delay is given in writing to the originating carrier or the delivering carrier within sixty (60) days after the delivery of the goods, or in the case of failure to make delivery, within nine (9) months from the date of shipment. (b) The first claimant of the claim must be filed within nine (9) months from the date of shipment, together with a copy of the paid freight bill RECEIVED at the point of origin on the date specified from the consignor mentioned herein; the property herein described in apparent good order, except as noted (contents and condition of packages unknown) marked, consigned and delivered, as indicated below, which the carrier agrees to carry and to deliver to the consignee at the said destination, subject to the rates and classification in effect on the date of shipment. It is mutually agreed, as to each carrier of all or any of the goods, and as to each party of any time interested in all or any of the goods, that every service to be performed hereunder shall be subject to the conditions standard Bill of Lading in power at the date of issuing, which are hereby agreed by the consignor and accepted for himself and his assigns. Printed or written, including conditions set aside by the standard Bill of Lading, in power at the date of issuing, which are hereby agreed by the consignor and accepted for himself and his assigns. The Contract for the carriage of the goods listed in the Bill of Lading is governed by regulation in force in the jurisdiction at the time and place of shipment and is subject to the conditions set out in such conditions.

Re: Regional Effects Program

Dear Mike Pope,

On November 10, 2022, Brooks Applied Labs (BAL) received thirty (30) solid samples at an acceptable temperature of 1.6 °C.

Sample ID values provided on the chain-of-custody (COC) forms did not exactly match the corresponding **Sample ID** values listed on containers. The discrepancies are described in the table below.

Laboratory ID	Sample ID (on COC form)	Sample ID (on container label)
2211152-01	RG_ERCKUT_SE-1_LAEMP_EVO_2022-10_N	RG_ERCKUT_SE-1_2022-10_N
2211152-02	RG_ERCKUT_SE-2_LAEMP_EVO_2022-10_N	RG_ERCKUT_SE-2_2022-10_N
2211152-03	RG_ERCKUT_SE-3_LAEMP_EVO_2022-11_N	RG_ERCKUT_SE_3_2022-11_N
2211152-04	RG_ERCKUT_SE-4_LAEMP_EVO_2022-11_N	RG_ERCKUT_SE_4_2022-11_N

2211152-29	RG_MI3_SE-1_LAEMP_EVO_2022-11_N	RG_MI3_SE-1_2022-11_N
2211152-30	RG_MI3_SE-2_LAEMP_EVO_2022-11_N	RG_MI3_SE-2_2022-11_N

Per client request, the samples described in the table above were logged in and reported using the **Sample ID** values on the COC forms (*column 2 in the table above*).

Each solid sample was logged-in for the analysis of total recoverable Se, Se sequential extraction, and total solids.

No analyses were requested on the COC forms for samples 2211152-17 (*RG_ERCKDT_BRYOSE-2_LAEMP_EVO_2022-10_N*) and 2211152-18 (*RG_ERCKDT_BRYOSE-3_LAEMP_EVO_2022-10_N*). Per client request, 2211152-17 and 2211152-18 were logged in for (total recoverable Se, Se sequential extraction, and total solids).

The sediments were wet and the water overlaying the sediments in the containers was decanted before the sediments were stored frozen. After receipt, all solid samples were stored in accordance with BAL SOPs.

Percent Total Solids (SOP BAL-0501)

An aliquot of each solid was measured into a pre-weighed vessel, dried in an oven at 105°C overnight, weighed again, and the percent of dried solid material was calculated.

Batch B222795 (%TS)

%TS results were used to dry-weight correct results for the remaining analytical parameters.

Total Recoverable Se (EPA 3050b MOD)

An aliquot of each solid was digested via modified EPA Method 3050B, using additions of concentrated nitric acid, hydrogen peroxide, and hydrochloric acid. The resulting digests were analyzed for Se content via inductively coupled plasma triple quadrupole mass spectrometry (ICP-QQQ-MS). The ICP-QQQ-MS instrumentation uses advanced interference removal techniques to ensure accuracy of the sample results. For more information, please visit the *Interference Reduction Technology* section on our website, brooksapplied.com.

Batch B222830 Total Recoverable Se)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the Sample Results page for sample-specific MDLs, MRLs, and other details.

The relative percent difference (RPD) for selenium (Se) in the laboratory duplicate sample B222830-DUP3 was greater than the control limit of 25%, at 35%. Secondary criteria were met (*i.e., avg result ≤ 5x the MRL and results within two MRL values*). No qualification of data was necessary.

Se Selective Sequential Extraction (SSE)

An aliquot of each solid was extracted in accordance with BAL's in-house five-step selective sequential extraction for Se. The samples were extracted with a series of reagents designed to target the following selenium fractions (see table below).

SSE Fraction	Fraction Description
F1	Se present as salt (<i>e.g., SeO₄⁻², MeSe(IV), SeCN</i>)
F2	Weakly adsorbed Se (<i>e.g., SeO₄⁻², SeO₃⁻², SeCN, MeSe(IV)</i>)
F3	Amorphous and crystalline Se (<i>e.g., S₂Se, Se⁰</i>)
F4	Selenides (<i>e.g., HgSe, PbSe, CdSe, ZnSe</i>)
F5	Residual Se

All resulting SSE fractions were directly analyzed for Se via inductively coupled plasma triple quadrupole mass spectrometry (ICP-QQQ-MS) and have been reported as Se(F1), Se(F2), Se(F3), Se(F4), and Se(F5) according to the corresponding extraction step (see table above).

Batch B222791 (SSE F1)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

Batch B222798 (SSE F2)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

Batch B222799 (SSE F3)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

Batch B222800 (SSE F4)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

Batch B222801 (SSE F5)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

Se Speciation for the SSE

Fractions F1 and F2 of the SSE were also analyzed for individual Se species via ion chromatography inductively coupled plasma collision reaction cell mass spectrometry (IC-ICP-CRC-MS). Selenium species were chromatographically separated on an ion exchange column and then quantified using inductively coupled plasma collision reaction cell mass spectrometry (ICP-CRC-MS); for more information on this determinative technique, please visit the *Interference Reduction Technology* section on our website. The chromatographic method applied for the analyses provides greater retention of methylseleninic acid and selenomethionine, allowing for more definitive quantitation of these species.

Selenium speciation for these SSE fractions was defined as dissolved selenite [*Se(IV)*], selenate [*Se(VI)*], selenocyanate [*SeCN*], methylseleninic acid [*MeSe(IV)*], selenomethionine [*SeMet*], selenosulfate [*SeSO₃*], and dimethylselenoxide [*DMSeO*]. Methaneselenonic acid [*MeSe(VI)*] is reported under *Se Unk A*. The total concentration of any remaining unidentified Se-containing species detected in each sample has also been reported as [*Unk Se Sp*].

DMS₂SeO elutes early in the chromatographic run due to the nature of the molecule and the applied chromatographic separation method. Since this species elutes near the dead volume, additional Se species may coelute. Alternate methods can be applied, upon client request, to increase the separation of DMS₂SeO from potentially co-eluting Se species.

Batch B222772 (Selenium Speciation on SSE F1)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

The RPD value for selenomethionine (*SeMet F1*) in the laboratory duplicate sample B222772-DUP4 was greater than the control limit of 25%, at 37%. Secondary criteria were met (*i.e.*, *avg result* $\leq 5 \times$ *the MRL and results within two MRL values*). No qualification of data was necessary.

Selenomethionine (*SeMet F1*) was detected in client sample 2211152-28. 2211152-28 was analyzed with selenomethionine spike in B222772-PS4, and the small peak for selenomethionine was confirmed. With the confirmation, selenium speciation results for 2211152-28 are reported from the initial injection in batch B222772.

Batch B222773 (Selenium Speciation on SSE F2)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

In instances when a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample concentration, the recoveries and the RPD were not considered valid indicators of data quality. In such instances, the recoveries of the blank spikes (BS) and/or standard reference materials (SRM) demonstrate the accuracy of the applied methods. When the spiking level was less than 25% of the native sample concentration, the spike recovery was not reported (NR) and the RPD of the MS/MSD set was not calculated (N/C).

Except for concentration qualifiers, all data were reported without qualification. All associated quality control sample results met the acceptance criteria.

BAL verifies that the reported results of all analyses for which the laboratory is accredited meet the requirements of the accrediting body, unless otherwise noted in the report narrative. For more information regarding accreditations please see the *Report Information* and *Batch Summary* pages. This report must be used in its entirety for interpretation of results.

Please feel free to contact us if you have any questions regarding this report.

Sincerely,

Jeremy Maute

Senior Project Manager

Jeremy@brooksapplied.com

Report Information

General Disclaimers

Test results are based solely upon the sample submitted to Brooks Applied Labs in the condition it was received. This report shall not be reproduced or copied, except in full, without written approval of the laboratory. Brooks Applied Labs is not responsible for the consequences arising from the use of a partial report.

Laboratory Accreditation

BAL maintains accreditation with various state and national agencies for select test methods. For a current list of BAL accreditations, please visit our website at <http://www.brooksapplied.com/resources/certificates-permits/>. The reported analyte/matrix/method combination shall be considered outside BAL's scopes of accreditation unless otherwise identified as ISO, TNI, or ISO,TNI in the tables. It is the responsibility of the client to verify whether a specific accreditation is required for the intended data use.

ISO: ISO/IEC 17025:2017 accredited test method. Issued by ANSI National Accreditation Board (ANAB), #ADE-1447.02

TNI: NELAP accredited test method. Issued by the State of Florida Department of Health, #E87982.

ISO,TNI: Test method is accredited under both the ISO/IEC 17025:2017 and NELAP accreditations referenced above.

Field Quality Control Samples

Please be notified that certain EPA methods require the collection of field quality control samples of an appropriate type and frequency; failure to do so is considered a deviation from some methods and for compliance purposes should only be done with the approval of regulatory authorities. Please see the specific EPA methods for details regarding required field quality control samples.

Definition of Data Qualifiers

E	An estimated value due to the presence of interferences. A full explanation is presented in the narrative.
H	Holding time and/or preservation requirements not met. Please see narrative for explanation.
J	Detected by the instrument, the result is > the MDL but ≤ the MRL. Result is reported and considered an estimate.
J-1	Estimated value. A full explanation is presented in the narrative.
M	Duplicate precision (RPD) was not within acceptance criteria. Please see narrative for explanation.
N	Spike recovery was not within acceptance criteria. Please see narrative for explanation.
R	Rejected, unusable value. A full explanation is presented in the narrative.
U	Result is ≤ the MDL or client requested reporting limit (CRRL). Result reported as the MDL or CRRL.
X	Result is not BLK-corrected and is within 10x the absolute value of the highest detectable BLK in the batch. Result is estimated.
Z	Holding time and/or preservation requirements not established for this method; however, BAL recommendations for holding time were not followed. Please see narrative for explanation.

Re: Regional Effects Program

Dear Mike Pope,

On December 9, 2022, Brooks Applied Labs (BAL) received twenty-five (25) solid samples at an acceptable temperature of -2.4 °C.

Sample ID values provided on the chain-of-custody (COC) forms did not exactly match the corresponding **Sample ID** values listed on containers. The discrepancies are described in the table below.

Laboratory ID	Sample ID (on COC form)	Sample ID (on container label)
2212159-01	RG_ERCKUT_SE-1_LAEMP_EVO_2022-12_N	RG_ERCKUT_SE-1_2022-12_N
2212159-02	RG_ERCKUT_SE-2_LAEMP_EVO_2022-12_N	RG_ERCKUT_SE-2_2022-12_N
2212159-03	RG_ERCKUT_SE-3_LAEMP_EVO_2022-12_N	RG_ERCKUT_SE-3_2022-12_N
2212159-04	RG_ERCKUT_SE-4_LAEMP_EVO_2022-12_N	RG_ERCKUT_SE-4_2022-12_N
2212159-05	RG_ERCKUT_SE-5_LAEMP_EVO_2022-12_N	RG_ERCKUT_SE-5_2022-12_N
2212159-06	RG_ERCKUT_BRYOSE-1_LAEMP_EVO_2022-12_N	RG_ERCKUT_BRYOSE-1_2022-12_N
2212159-07	RG_ERCKUT_BRYOSE-2_LAEMP_EVO_2022-12_N	RG_ERCKUT_BRYOSE-2_2022-12_N
2212159-08	RG_ERCKUT_BRYOSE-3_LAEMP_EVO_2022-12_N	RG_ERCKUT_BRYOSE-3_2022-12_N

2212159-25	RG_BOCKRD_SE-1_LAEMP_EVO_2022-12_N	RG_BOCKRD_SE-1_2022-12_N

Per client request, the samples described in the table above were logged in and reported using the **Sample ID** values on the COC forms (*column 2 in the table above*).

Each solid sample was logged-in for the analysis of total recoverable Se, Se sequential extraction, and total solids.

The sediments were wet and the water overlaying the sediments in the containers was decanted before the sediments were stored frozen. After receipt, all solid samples were stored in accordance with BAL SOPs.

Percent Total Solids (SOP BAL-0501)

An aliquot of each solid was measured into a pre-weighed vessel, dried in an oven at 105°C overnight, weighed again, and the percent of dried solid material was calculated.

Batch B223015 (%TS)

%TS results were used to dry-weight correct results for the remaining analytical parameters.

Total Recoverable Se (EPA 3050b MOD)

An aliquot of each solid was digested via modified EPA Method 3050B, using additions of concentrated nitric acid, hydrogen peroxide, and hydrochloric acid. The resulting digests were analyzed for Se content via inductively coupled plasma triple quadrupole mass spectrometry (ICP-QQQ-MS). The ICP-QQQ-MS instrumentation uses advanced interference removal techniques to ensure accuracy of the sample results. For more information, please visit the *Interference Reduction Technology* section on our website, brooksapplied.com.

Batch B223019 Total Recoverable Se)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the Sample Results page for sample-specific MDLs, MRLs, and other details.

Se Selective Sequential Extraction (SSE)

An aliquot of each solid was extracted in accordance with BAL's in-house five-step selective sequential extraction for Se. The samples were extracted with a series of reagents designed to target the following selenium fractions (see table below).

SSE Fraction	Fraction Description
F1	Se present as salt (e.g., SeO_4^{2-} , MeSe(IV) , SeCN)
F2	Weakly adsorbed Se (e.g., SeO_4^{2-} , SeO_3^{2-} , SeCN , MeSe(IV))
F3	Amorphous and crystalline Se (e.g., S_2Se , Se^0)
F4	Selenides (e.g., HgSe , PbSe , CdSe , ZnSe)
F5	Residual Se

All resulting SSE fractions were directly analyzed for Se via inductively coupled plasma triple quadrupole mass spectrometry (ICP-QQQ-MS) and have been reported as Se(F1), Se(F2), Se(F3), Se(F4), and Se(F5) according to the corresponding extraction step (see table above).

Batch B223024 (SSE F1)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

Batch B223025 (SSE F2)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

Batch B223026 (SSE F3)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

Batch B223027(SSE F4)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

The relative percent difference (RPD) for selenium (*Se(F4)*) in the laboratory duplicate sample B223027-DUP1 was greater than the control limit of 25%, at 48%. The selenium (*Se(F4)*) RPD values were elevated in the laboratory duplicate samples B223027-DUP2 and B223027-DUP3 (40% and 66%, respectively). In each case, secondary criteria were met (*i.e., avg result ≤ 5x the MRL and results within two MRL values*). No qualification of data was necessary.

Batch B223028 (SSE F5)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

Se Speciation for the SSE

Fractions F1 and F2 of the SSE were also analyzed for individual Se species via ion chromatography inductively coupled plasma collision reaction cell mass spectrometry (IC-ICP-CRC-MS). Selenium species were chromatographically separated on an ion exchange column and then quantified using inductively coupled plasma collision reaction cell mass spectrometry (ICP-CRC-MS); for more information on this determinative technique, please visit the *Interference Reduction Technology* section on our website. The chromatographic method applied for the analyses provides greater retention of methylseleninic acid and selenomethionine, allowing for more definitive quantitation of these species.

Selenium speciation for these SSE fractions was defined as dissolved selenite [*Se(IV)*], selenate [*Se(VI)*], selenocyanate [*SeCN*], methylseleninic acid [*MeSe(IV)*], selenomethionine [*SeMet*], selenosulfate [*SeSO₃*], and dimethylselenoxide [*DMSeO*]. Methaneselenonic acid [*MeSe(VI)*] is reported under *Se Unk A*. The total concentration of any remaining unidentified Se-containing species detected in each sample has also been reported as [*Unk Se Sp*].

DMS₂SeO elutes early in the chromatographic run due to the nature of the molecule and the applied chromatographic separation method. Since this species elutes near the dead volume, additional Se species may coelute. Alternate methods can be applied, upon client request, to increase the separation of DMS₂SeO from potentially co-eluting Se species.

Batch B223051 (Selenium Speciation on SSE F1)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the *Sample Results* page for sample-specific MDLs, MRLs, and other details.

Batch B223052 (Selenium Speciation on SSE F2)

The results were not method blank corrected, as described in the calculations section of the relevant BAL SOPs and were evaluated using reporting limits adjusted to account for sample aliquot size. Please refer to the Sample Results page for sample-specific MDLs, MRLs, and other details.

In instances when a matrix spike/matrix spike duplicate (MS/MSD) set was spiked at a level less than the native sample concentration, the recoveries and the RPD were not considered valid indicators of data quality. In such instances, the recoveries of the blank spikes (BS) and/or standard reference materials (SRM) demonstrate the accuracy of the applied methods. When the spiking level was less than 25% of the native sample concentration, the spike recovery was not reported (NR) and the RPD of the MS/MSD set was not calculated (N/C).

Except for concentration qualifiers, all data were reported without qualification. All associated quality control sample results met the acceptance criteria.

BAL verifies that the reported results of all analyses for which the laboratory is accredited meet the requirements of the accrediting body, unless otherwise noted in the report narrative. For more information regarding accreditations please see the *Report Information* and *Batch Summary* pages. This report must be used in its entirety for interpretation of results.

Please feel free to contact us if you have any questions regarding this report.

Sincerely,

Jeremy Maute
Senior Project Manager
Jeremy@brooksapplied.com

Report Information

General Disclaimers

Test results are based solely upon the sample submitted to Brooks Applied Labs in the condition it was received. This report shall not be reproduced or copied, except in full, without written approval of the laboratory. Brooks Applied Labs is not responsible for the consequences arising from the use of a partial report.

Laboratory Accreditation

BAL maintains accreditation with various state and national agencies for select test methods. For a current list of BAL accreditations, please visit our website at <http://www.brooksapplied.com/resources/certificates-permits/>. The reported analyte/matrix/method combination shall be considered outside BAL's scopes of accreditation unless otherwise identified as ISO, TNI, or ISO,TNI in the tables. It is the responsibility of the client to verify whether a specific accreditation is required for the intended data use.

ISO: ISO/IEC 17025:2017 accredited test method. Issued by ANSI National Accreditation Board (ANAB), #ADE-1447.02

TNI: NELAP accredited test method. Issued by the State of Florida Department of Health, #E87982.

ISO,TNI: Test method is accredited under both the ISO/IEC 17025:2017 and NELAP accreditations referenced above.

Field Quality Control Samples

Please be notified that certain EPA methods require the collection of field quality control samples of an appropriate type and frequency; failure to do so is considered a deviation from some methods and for compliance purposes should only be done with the approval of regulatory authorities. Please see the specific EPA methods for details regarding required field quality control samples.

Common Abbreviations

AR	as received	MS	matrix spike
BAL	Brooks Applied Labs	MSD	matrix spike duplicate
BLK	method blank	ND	non-detect
BS	blank spike	NR	non-reportable
CAL	calibration standard	N/C	not calculated
CCB	continuing calibration blank	PS	post preparation spike
CCV	continuing calibration verification	REC	percent recovery
COC	chain of custody record	RPD	relative percent difference
D	dissolved fraction	SCV	secondary calibration verification
DUP	duplicate	SOP	standard operating procedure

ICV	initial calibration verification	T	total fraction
MDL	method detection limit	TR	total recoverable fraction
MRL	method reporting limit		

Definition of Data Qualifiers

E	An estimated value due to the presence of interferences. A full explanation is presented in the narrative.
H	Holding time and/or preservation requirements not met. Please see narrative for explanation.
J	Detected by the instrument, the result is > the MDL but ≤ the MRL. Result is reported and considered an estimate.
J-1	Estimated value. A full explanation is presented in the narrative.
M	Duplicate precision (RPD) was not within acceptance criteria. Please see narrative for explanation.
N	Spike recovery was not within acceptance criteria. Please see narrative for explanation.
R	Rejected, unusable value. A full explanation is presented in the narrative.
U	Result is ≤ the MDL or client requested reporting limit (CRRL). Result reported as the MDL or CRRL.
X	Result is not BLK-corrected and is within 10x the absolute value of the highest detectable BLK in the batch. Result is estimated.
Z	Holding time and/or preservation requirements not established for this method; however, BAL recommendations for holding time were not followed. Please see narrative for explanation.

<small>NOTICE OF CLAIM: (a) No carrier is liable for loss, damage, or delay of any goods under the Bill of Lading unless notice, therefore setting out particulars of the claim, destination and date of shipment of the goods and the estimated amount claimed, is filed within nine (9) months from the date of shipment together with a copy of the paid freight bill. (b) The final statement of the claim must be filed within nine (9) months from the date of shipment. (c) The claim must be filed with the originator carrier or the delivering carrier within sixty (60) days after the delivery of the goods, in the case of failure to make delivery within nine (9) months from the date of shipment. (d) The claim must be filed with the consignee provided herein, if the property herein consigned, in apparent good order, except as noted. Contents and condition of articles or package unknown, marked, consigned and destined as indicated below, which the carrier agrees to carry and to deliver to the consignee at the said destination, subject to the rates and classification in effect on the date of shipment. It is mutually agreed as to each carrier of all or any of the goods over all or any portion of the route to destination, and as to each party of any time interested in all or any of the goods, that every service to be performed hereunder shall be subject to the conditions of the standard Bill of Lading, in power at the date of issuing, which are hereby agreed by the consignor and accepted for himself and his assigns. Printed or written, including conditions set aside by the standard Bill of Lading, in power at the date of issuing, which are hereby agreed by the consignor and accepted for himself and his assigns. The Contract for the carriage of the goods listed in the Bill of Lading is governed by regulation in force in the jurisdiction at the time and place of shipment and is subject to the conditions set out in such conditions.</small>

Trich Analytics Laboratory Reports

TrichAnalytics Inc.

Tissue Microchemistry Analysis Report

Client: Tyler Mehler
Aquatic Scientist
Minnow Environmental
Phone: (250) 595-1627
Email: tyler.mehler@minnow.ca

Date Received: 10 Mar 2022
Date of Analysis: 15 Mar 2022
Final Report Date: 16 Mar 2022
Project No.: 2022-314
Method No.: MET-002.05

Client Project: EVO LAEMP (22-12)

Analytical Request: Composite-Taxa Benthic Invertebrate Tissue (total metals and moisture) - 23 samples.
See chain of custody form provided for sample identification numbers.

Notes:

Analytical results are expressed in parts per million (ppm) dry weight (equivalent to mg/kg).
Samples quantified using DORM-4, NIST-1566b, and NIST-2976 certified reference standards.
Aluminum concentrations above 1,000 ppm are outside linear range of the calibration curve.
RPD values calculated according to the British Columbia Environmental Laboratory Manual (2020) criteria.
Client specific DQO for Selenium accuracy is 90-110% of the certified value; result achieved 110% (ranging from 109-110%).

This report provides the analytical results only for tissue samples noted above as received from the Client.

Reviewed and Approved by Jennie Christensen, PhD, RPBio

Notes:

ppm = parts per million
 RPD = relative percent difference
 DL = detection limit
 < = less than detection limit
 % = percent

Data Quality Objectives:

Laboratory Duplicates - RPD ≤40% for all elements, except Ca and Sr, which are ≤60%
 Minimum DQOs apply to individual samples at concentrations above 10x DL

Notes:

ppm = parts per million; % = percent; DL = detection limit; RSD = relative standard deviation

Data Quality Objectives:

Accuracy: DQO of 60 - 140% of the certified values for B, Ti, Ag, Sn, Sb, and Ba.

Accuracy: DQO of 90 - 110% of the certified values for Se.

Accuracy: DQO of 70 - 130% of the certified values for all other elements provided.

Precision: DQO of ≤20% for all elements.

DORM-4 used for all parameters except B, Ti, Sb, Ba, and Al where NIST-1566b was used.

Tl certified concentration from NIST-2976.

Accuracy and precision for Tl are not reported as the certified concentration is too close to the reportable detection limit.

Tissue Microchemistry Analysis Report

Client: Tyler Mehler
Aquatic Scientist
Minnow Environmental
Phone: (250) 595-1627
Email: tyler.mehler@minnow.ca

Date Received: 28 Apr 2022
Date of Analysis: 04 May 2022
Final Report Date: 04 May 2022
Project No.: 2022-324
Method No.: MET-002.06

Client Project: EVO LAEMP (22-12)

Analytical Request: Composite-Taxa Benthic Invertebrate Tissue Microchemistry (total metals & moisture) - 17 samples.
See chain of custody form provided for sample identification numbers.

Notes:

Analytical results are expressed in parts per million (ppm) dry weight (equivalent to mg/kg).
Samples quantified using DORM-4, NIST-1566b, and NIST-2976 certified reference standards.
Aluminum concentrations above 1,000 ppm are outside linear range of the calibration curve.
RPD values calculated according to the British Columbia Environmental Laboratory Manual (2020) criteria.
Client specific DQO for Selenium accuracy is 90-110% of the certified value; result achieved 107%.

This report provides the analytical results only for tissue samples noted above as received from the Client.

Reviewed and Approved by Jennie Christensen, PhD, RPBio

Notes:

ppm = parts per million
 RPD = relative percent difference
 DL = detection limit
 < = less than detection limit
 % = percent

Data Quality Objectives:

Laboratory Duplicates - RPD ≤40% for all elements, except Ca and Sr, which are ≤60%
 Minimum DQOs apply to individual samples at concentrations above 10x DL

238U	0.001	0.05	0.052	105	7.1

Notes:

ppm = parts per million; % = percent; DL = detection limit; RSD = relative standard deviation

Data Quality Objectives:

Accuracy: DQO of 60 - 140% of the certified values for B, Ti, Ag, Sn, Sb, and Ba.

Accuracy: DQO of 90 - 110% of the certified values for Se.

Accuracy: DQO of 70 - 130% of the certified values for all other elements provided.

Precision: DQO of ≤20% for all elements.

DORM-4 used for all parameters except B, Ti, Sb, Ba, and Al where NIST-1566b was used.

Tl certified concentration from NIST-2976.

Accuracy and precision for Tl are not reported as the certified concentration is too close to the reportable detection limit.

TrichAnalytics Inc.

Tissue Microchemistry Analysis Report

Client: Tyler Mehler Aquatic Scientist Minnow Environmental	Date Received: 03 May 2022
Phone: 250-595-1627	Date of Analysis: 05 May 2022
Email: tyler.mehler@minnow.ca	Final Report Date: 06 May 2022
	Project No.: 2022-329
	Method No.: MET-002.06

Client Project: EVO LAEMP (22-12) PO#818999

Analytical Request: Composite-Taxa Benthic Invertebrate Tissue Microchemistry (total metals & moisture) - 50 samples
See chain of custody form provided for sample identification numbers.

Notes:

Analytical results are expressed in parts per million (ppm) dry weight (equivalent to mg/kg).
Samples quantified using DORM-4, NIST-1566b, and NIST-2976 certified reference standards.
Aluminum concentrations above 1,000 ppm are outside linear range of the calibration curve.
RPD values calculated according to the British Columbia Environmental Laboratory Manual (2020) criteria.
Client-specific DQO for Selenium accuracy is 90-110% of the certified value; result achieved 107% (ranging from 98-110%).

This report provides the analytical results only for tissue samples noted above as received from the Client.

Notes:

ppm = parts per million; % = percent; DL = detection limit; RSD = relative standard deviation

Data Quality Objectives:

Accuracy: DQO of 60 - 140% of the certified values for B, Ti, Ag, Sn, Sb, and Ba.

Accuracy: DQO of 90 - 110% of the certified values for Se.

Accuracy: DQO of 70 - 130% of the certified values for all other elements provided.

Precision: DQO of ≤20% for all elements.

DORM-4 used for all parameters except B, Ti, Sb, Ba, and Al where NIST-1566b was used.

Tl certified concentration from NIST-2976.

Accuracy and precision for Tl are not reported as the certified concentration is too close to the reportable detection limit.

TrichAnalytics Inc.

Tissue Microchemistry Analysis Report

Client: Mike Pope Project Manager Teck Coal Limited	Date Received: 16 May 2022
Phone: (250) 425-8449	Date of Analysis: 20 May 2022
Email: mike.pope@teck.com; jessica.ritz@teck.com; aquascilab@teck.com; tyler.mehler@minnow.ca	Final Report Date: 24 May 2022
	Project No.: 2022-333
	Method No.: MET-002.06

Client Project: EVO_LAEMP Regional Aquatic Effects (PO 818999)

Analytical Request: Composite Benthic Invertebrate Tissue Microchemistry (total metals & moisture) - 66 samples.
See chain of custody form provided for sample identification numbers.

Notes:

Analytical results are expressed in parts per million (ppm) dry weight (equivalent to mg/kg).
Samples quantified using DORM-4, NIST-1566b, and NIST-2976 certified reference standards.
Aluminum concentrations above 1,000 ppm are outside linear range of the calibration curve.
RPD values calculated according to the British Columbia Environmental Laboratory Manual (2020) criteria.
Client specific DQO for Selenium accuracy is 90-110% of the certified value; result achieved 99% (ranging from 92-105%).
The following samples were transferred directly to glass slide as a smear/blob. Sample weights were not recorded and therefore; moisture content is reported as 100.0%: Trich Sample IDs 266, 267, 268, 269, 270, 286, 287, 288, 289, 290, 306, 307, 308, 309, 310, and 316. For sample ID# 289, sample volume was very small and thin, so concentrations provided may not be accurate due to volume issues.

This report provides the analytical results only for tissue samples noted above as received from the Client.

Reviewed and Approved by Jennie Christensen, PhD, RPBio

238U	0.001	0.05	0.059	117	11	0.054	108	18

Notes:

ppm = parts per million; % = percent; DL = detection limit; RSD = relative standard deviation

Data Quality Objectives:

Accuracy: DQO of 60 - 140% of the certified values for B, Ti, Ag, Sn, Sb, and Ba.

Accuracy: DQO of 90 - 110% of the certified values for Se.

Accuracy: DQO of 70 - 130% of the certified values for all other elements provided.

Precision: DQO of ≤20% for all elements.

DORM-4 used for all parameters except B, Ti, Sb, Ba, and Al where NIST-1566b was used.

Tl certified concentration from NIST-2976.

Accuracy and precision for Tl are not reported as the certified concentration is too close to the reportable detection limit.

TrichAnalytics Inc.

Tissue Microchemistry Analysis Report

Client: Mike Pope Project Manager Teck Coal Limited	Date Received: 14 Jun 2022
Phone: (250)-425-8449	Date of Analysis: 20 Jun 2022
Email: mike.pope@teck.com; jessica.ritz@teck.com; teckcoal@equisonline.com; aquascilab@teck.com; tyler.mehler@minnow.ca	Final Report Date: 21 Jun 2022
	Project No.: 2022-344
	Method No.: MET-002.06

Client Project: EVO_LAEMP Regional Aquatic Effects

Analytical Request: Composite Benthic Invertebrate Tissue Microchemistry (total metals & moisture) - 60 samples.
See chain of custody form provided for sample identification numbers.

Notes:

Analytical results are expressed in parts per million (ppm) dry weight (equivalent to mg/kg).
Samples quantified using DORM-4, NIST-1566b, and NIST-2976 certified reference standards.
Aluminum concentrations above 1,000 ppm are outside linear range of the calibration curve.
RPD values calculated according to the British Columbia Environmental Laboratory Manual (2020) criteria.
Client specific DQO for Selenium accuracy is 90-110% of the certified value; result achieved 101% (ranging from 94-108%).

This report provides the analytical results only for tissue samples noted above as received from the Client.

Notes:

ppm = parts per million; % = percent; DL = detection limit; RSD = relative standard deviation

Data Quality Objectives:

Accuracy: DQO of 60 - 140% of the certified values for B, Ti, Ag, Sn, Sb, and Ba.

Accuracy: DQO of 90 - 110% of the certified values for Se.

Accuracy: DQO of 70 - 130% of the certified values for all other elements provided.

Precision: DQO of ≤20% for all elements.

DORM-4 used for all parameters except B, Ti, Sb, Ba, and Al where NIST-1566b was used.

Tl certified concentration from NIST-2976.

Accuracy and precision for Tl are not reported as the certified concentration is too close to the reportable detection limit.

Tissue Microchemistry Analysis Report

Client: Mike Pope Project Manager Teck Coal Limited	Date Received: 06 Jul 2022 Date of Analysis: 13 Jul 2022 14 Jul 2022
Phone: 250-425-8449	Final Report Date: 15 Jul 2022
Email: mike.pope@teck.com ; jessica.ritz@teck.com ; teckcoal@equisonline.com ; aquascilab@teck.com ; tyler.mehler@minnow.ca	Project No.: 2022-356 Method No.: MET-002.06

Client Project: EVO LAEMP (PO# 818999)

Analytical Request: Benthic invertebrate tissue microchemistry (total metals & moisture) - 56 samples
See chain of custody form provided for sample identification numbers.

Notes:

Analytical results are expressed in parts per million (ppm) dry weight (equivalent to mg/kg)
Samples quantified using DORM-4, NIST-1566b, and NIST-2976 certified reference standards.
Aluminum concentrations above 1,000 ppm are outside linear range of the calibration curve.
RPD values calculated according to the British Columbia Environmental Laboratory Manual (2020) criteria.
Client specific DQO for Selenium accuracy is 90-110% of the certified value; result achieved 101% (ranged from 94 to 110%).

This report provides the analytical results only for tissue samples noted above as received from the Client.

Notes:

ppm = parts per million; % = percent; DL = detection limit; RSD = relative standard deviation

Data Quality Objectives:

Accuracy: DQO of 60 - 140% of the certified values for B, Ti, Ag, Sn, Sb, and Ba.

Accuracy: DQO of 90 - 110% of the certified values for Se.

Accuracy: DQO of 70 - 130% of the certified values for all other elements provided.

Precision: DQO of ≤20% for all elements.

DORM-4 used for all parameters except B, Ti, Sb, Ba, and Al where NIST-1566b was used.

Tl certified concentration from NIST-2976.

Accuracy and precision for Tl are not reported as the certified concentration is too close to the reportable detection limit.

Tissue Microchemistry Analysis Report

Client: Mike Pope Project Manager Teck Coal Limited	Date Received: 04 Aug 2022
Phone: (250) 425-8449	Date of Analysis: 10 Aug 2022
Email: mike.pope@teck.com; jessica.ritz@teck.com; teckcoal@equisonline.com; aquascilab@teck.com; tyler.mehler@minnow.ca	Final Report Date: 11 Aug 2022
	Project No.: 2022-367
	Method No.: MET-002.06

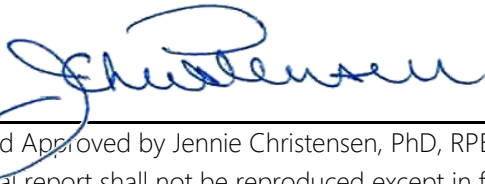

Client Project: EVO_LAEMP_JULY Regional Aquatics Effects (PO 847031)

Analytical Request: Composite Benthic Invertebrate Tissue Microchemistry (total metals & moisture) - 65 samples.
See chain of custody form provided for sample identification numbers.

Notes:

Analytical results are expressed in parts per million (ppm) dry weight (equivalent to mg/kg).
Samples quantified using DORM-4, NIST-1566b, and NIST-2976 certified reference standards.
Aluminum concentrations above 1,000 ppm are outside linear range of the calibration curve.
RPD values calculated according to the British Columbia Environmental Laboratory Manual (2020) criteria.
Client specific DQO for Selenium accuracy is 90-110% of the certified value; result achieved 102% (ranging from 97-107%).

This report provides the analytical results only for tissue samples noted above as received from the Client.

Reviewed and Approved by Jennie Christensen, PhD, RPBio

Notes:

ppm = parts per million; % = percent; DL = detection limit; RSD = relative standard deviation

Data Quality Objectives:

Accuracy: DQO of 60 - 140% of the certified values for B, Ti, Ag, Sn, Sb, and Ba.

Accuracy: DQO of 90 - 110% of the certified values for Se.

Accuracy: DQO of 70 - 130% of the certified values for all other elements provided.

Precision: DQO of ≤20% for all elements.

DORM-4 used for all parameters except B, Ti, Sb, Ba, and Al where NIST-1566b was used.

Tl certified concentration from NIST-2976.

Accuracy and precision for Tl are not reported as the certified concentration is too close to the reportable detection limit.

Tissue Microchemistry Analysis Report

Client: Mike Pope Project Manager Teck Coal Ltd	Date Received: 20 Sep 2022
Phone: (250) 425-8247	Date of Analysis: 28 Sep 2022
Email: aquascilab@teck.com; teckcoal@equisonline.com; teck.lab.results@teck.com; lisa.bowron@minnow.ca; tyler.mehler@minnow.ca jessica.ritz@teck.com	Final Report Date: 06 Oct 2022
	Project No.: 2022-400
	Method No.: MET-002.06

Client Project: REP_LAEMP_EVO_2022-09 Regional Effects Program (PO 818999)

Analytical Request: Composite Benthic Invertebrate Tissue Microchemistry (total metals & moisture) - 49 samples.
See chain of custody form provided for sample identification numbers.

Notes:

Analytical results are expressed in parts per million (ppm) dry weight (equivalent to mg/kg).
Samples quantified using DORM-4, NIST-1566b, and NIST-2976 certified reference standards.
Aluminum concentrations above 1,000 ppm are outside linear range of the calibration curve.
RPD values calculated according to the British Columbia Environmental Laboratory Manual (2020) criteria.
Client specific DQO for Selenium accuracy is 90-110% of the certified value; result achieved 105% (ranging from 96-110%).

This report provides the analytical results only for tissue samples noted above as received from the Client.

Notes:

ppm = parts per million; % = percent; DL = detection limit; RSD = relative standard deviation

Data Quality Objectives:

Accuracy: DQO of 60 - 140% of the certified values for B, Ti, Ag, Sn, Sb, and Ba.

Accuracy: DQO of 90 - 110% of the certified values for Se.

Accuracy: DQO of 70 - 130% of the certified values for all other elements provided.

Precision: DQO of ≤20% for all elements.

DORM-4 used for all parameters except B, Ti, Sb, Ba, and Al where NIST-1566b was used.

Tl certified concentration from NIST-2976.

Accuracy and precision for Tl are not reported as the certified concentration is too close to the reportable detection limit.

Tissue Microchemistry Analysis Report

Client: Mike Pope Project Manager Teck Coal Ltd	Date Received: 20 Sep 2022
Phone: (250)425-8247	Date of Analysis: 27 Sep 2022
Email: aquascilab@teck.com; teckcoal@equisonline.com; teck.lab.results@teck.com; lisa.bowron@minnow.ca; tyler.mehler@minnow.ca jessica.ritz@teck.com	Final Report Date: 06 Oct 2022
	Project No.: 2022-404
	Method No.: MET-002.06

Client Project: REP_LAEMP_EVO_2022-09 Regional Effects Program (PO 847031)

Analytical Request: Composite Benthic Invertebrate Tissue Microchemistry (total metals & moisture) - 3 samples.
See chain of custody form provided for sample identification numbers.

Notes:

Analytical results are expressed in parts per million (ppm) dry weight (equivalent to mg/kg).
Samples quantified using DORM-4, NIST-1566b, and NIST-2976 certified reference standards.
RPD values calculated according to the British Columbia Environmental Laboratory Manual (2020) criteria.
Client specific DQO for Selenium accuracy is 90-110% of the certified value; result achieved 103%.

This report provides the analytical results only for tissue samples noted above as received from the Client.

Reviewed and Approved by Jennie Christensen, PhD, RPBio

Notes:

ppm = parts per million
 RPD = relative percent difference
 DL = detection limit
 < = less than detection limit
 % = percent

Data Quality Objectives:

Laboratory Duplicates - RPD ≤40% for all elements, except Ca and Sr, which are ≤60%
 Minimum DQOs apply to individual samples at concentrations above 10x DL

Notes:

ppm = parts per million; % = percent; DL = detection limit; RSD = relative standard deviation

Data Quality Objectives:

Accuracy: DQO of 60 - 140% of the certified values for B, Ti, Ag, Sn, Sb, and Ba.

Accuracy: DQO of 90 - 110% of the certified values for Se.

Accuracy: DQO of 70 - 130% of the certified values for all other elements provided.

Precision: DQO of ≤20% for all elements.

DORM-4 used for all parameters except B, Ti, Sb, Ba, and Al where NIST-1566b was used.

Tl certified concentration from NIST-2976.

Accuracy and precision for Tl are not reported as the certified concentration is too close to the reportable detection limit.

Tissue Microchemistry Analysis Report

Client: Mike Pope Project Manager Teck Coal Ltd	Date Received: 28 Sep 2022
Phone: (250) 425-8247	Date of Analysis: 12 Oct 2022
Email: aquascilab@teck.com; jessica.ritz@teck.com; teck.lab.results@teck.com; lisa.bowron@minnow.ca; tyler.mehler@minnow.ca; teckcoal@equisonline.com; mike.pope@teck.com	Final Report Date: 12 Oct 2022
	Project No.: 2022-407
	Method No.: MET-002.06

Client Project: REP_LAEMP_EVO_2022-09 Regional Effects Program (PO 818999)

Analytical Request: Composite Benthic Invertebrate Tissue Microchemistry (total metals & moisture) - 11 samples.
See chain of custody form provided for sample identification numbers.

Notes:

Analytical results are expressed in parts per million (ppm) dry weight (equivalent to mg/kg).
Samples quantified using DORM-4, NIST-1566b, and NIST-2976 certified reference standards.
RPD values calculated according to the British Columbia Environmental Laboratory Manual (2020) criteria.
Client specific DQO for Selenium accuracy is 90-110% of the certified value; result achieved 108%.

This report provides the analytical results only for tissue samples noted above as received from the Client.

Reviewed and Approved by Jennie Christensen, PhD, RPBio

Notes:

ppm = parts per million; % = percent; DL = detection limit; RSD = relative standard deviation

Data Quality Objectives:

Accuracy: DQO of 60 - 140% of the certified values for B, Ti, Ag, Sn, Sb, and Ba.

Accuracy: DQO of 90 - 110% of the certified values for Se.

Accuracy: DQO of 70 - 130% of the certified values for all other elements provided.

Precision: DQO of ≤20% for all elements.

DORM-4 used for all parameters except B, Ti, Sb, Ba, and Al where NIST-1566b was used.

Tl certified concentration from NIST-2976.

Accuracy and precision for Tl are not reported as the certified concentration is too close to the reportable detection limit.

Tissue Microchemistry Analysis Report

Client: Mike Pope Project Manager Teck Coal Limited	Date Received: 10 Nov 2022
Phone: (250) 425-8202	Date of Analysis: 21 Nov 2022
Email: mike.pope@teck.com; jessica.ritz@teck.com; aquascilab@teck.com; teckcoal@equisonline.com; robin.valleau@minnow.ca; hillary.quinn-austin@minnow.ca	Final Report Date: 22 Nov 2022
	Project No.: 2022-432
	Method No.: MET-002.06

Client Project: EVO_LAEMP_NOV Regional Effects Program (PO 847031)

Analytical Request: Composite Benthic Invertebrate Tissue Microchemistry (total metals & moisture) - 56 samples.
See chain of custody form provided for sample identification numbers.

Notes:

Analytical results are expressed in parts per million (ppm) dry weight (equivalent to mg/kg).
Samples quantified using DORM-4, NIST-1566b, and NIST-2976 certified reference standards.
Aluminum concentrations above 1,000 ppm are outside linear range of the calibration curve.
RPD values calculated according to the British Columbia Environmental Laboratory Manual (2020) criteria.
Client specific DQO for Selenium accuracy is 90-110% of the certified value; result achieved 103% (ranged from 99-106%).

This report provides the analytical results only for tissue samples noted above as received from the Client.

Notes:

- ppm = parts per million
- RPD = relative percent difference
- DL = detection limit
- < = less than detection limit
- % = percent

Data Quality Objectives:

Laboratory Duplicates - RPD ≤40% for all elements, except Ca and Sr, which are ≤60%
Minimum DQOs apply to individual samples at concentrations above 10x DL

Notes:

- ppm = parts per million
- RPD = relative percent difference
- DL = detection limit
- < = less than detection limit
- % = percent

Data Quality Objectives:

Laboratory Duplicates - RPD ≤40% for all elements, except Ca and Sr, which are ≤60%
Minimum DQOs apply to individual samples at concentrations above 10x DL

Notes:

ppm = parts per million; % = percent; DL = detection limit; RSD = relative standard deviation

Data Quality Objectives:

Accuracy: DQO of 60 - 140% of the certified values for B, Ti, Ag, Sn, Sb, and Ba.

Accuracy: DQO of 90 - 110% of the certified values for Se.

Accuracy: DQO of 70 - 130% of the certified values for all other elements provided.

Precision: DQO of ≤20% for all elements.

DORM-4 used for all parameters except B, Ti, Sb, Ba, and Al where NIST-1566b was used.

Tl certified concentration from NIST-2976.

Accuracy and precision for Tl are not reported as the certified concentration is too close to the reportable detection limit.

Tissue Microchemistry Analysis Report

Client: Mike Pope Project Manager Teck Coal Limited	Date Received: 06 Dec 2022
Phone: 250-425-8202	Date of Analysis: 07 Dec 2022
Email: mike.pope@teck.com; aquascilab@teck.com; jessica.ritz@teck.com; teckcoal@equisonline.com; robin.valleau@minnow.ca; hillary.quinn-austin@minnow.ca	Final Report Date: 08 Dec 2022
	Project No.: 2022-444
	Method No.: MET-002.06

Client Project: EVO_LAEMP_DEC Regional Effects Program (PO 847031)

Analytical Request: Composite Benthic Invertebrate Tissue Microchemistry (total metals & moisture) - 46 samples.
See chain of custody form provided for sample identification numbers.

Notes:

Analytical results are expressed in parts per million (ppm) dry weight (equivalent to mg/kg).
Samples quantified using DORM-4, NIST-1566b, and NIST-2976 certified reference standards.
Aluminum concentrations above 1,000 ppm are outside linear range of the calibration curve.
RPD values calculated according to the British Columbia Environmental Laboratory Manual (2020) criteria.
Client specific DQO for Selenium accuracy is 90-110% of the certified value; result achieved 96% (ranging from 91-99%).

This report provides the analytical results only for tissue samples noted above as received from the Client.

Notes:

ppm = parts per million; % = percent; DL = detection limit; RSD = relative standard deviation

Data Quality Objectives:

Accuracy: DQO of 60 - 140% of the certified values for B, Ti, Ag, Sn, Sb, and Ba.

Accuracy: DQO of 90 - 110% of the certified values for Se.

Accuracy: DQO of 70 - 130% of the certified values for all other elements provided.

Precision: DQO of ≤20% for all elements.

DORM-4 used for all parameters except B, Ti, Sb, Ba, and Al where NIST-1566b was used.

Tl certified concentration from NIST-2976.

Accuracy and precision for Tl are not reported as the certified concentration is too close to the reportable detection limit.

Sample Reception

On September 29, 2022, Cordillera Consulting received 32 benthic samples from Minnow Environmental. When samples arrived to Cordillera Consulting, exterior packaging was initially inspected for damage or wet spots that would have indicated damage to the interior containers.

Samples were logged into a proprietary software database (INSTAR1) where the clients assigned sample name was recorded along with a Cordillera Consulting (CC) number for cross-reference. Each sample was checked to ensure that all sites and replicates recorded on field sheets or packing lists were delivered intact and with adequate preservative. Any missing, mislabelled or extra samples were reported to the client immediately to confirm the total numbers and correct names on the sample jars. The client representative was notified of the arrival of the shipment and provided a sample inventory once intake was completed.

See table below for sample inventory:

Table 1: Summary of sample information including Cordillera Consulting (CC) number

Sample	CC#	Date	Size	# of Jars
RG_BOCK_BIC-1_2022-09-15_N	CC231066	9/15/2022	400µM	2

Sample Sorting

- Using a gridded Petri dish, fine forceps and a low power stereo-microscope (Olympus, Nikon, Leica) the sorting technicians removed the invertebrates and sorted them into family/orders.
- The sorting technician kept a running tally of total numbers excluding organisms from Porifera, Nemata, Platyhelminthes, Ostracoda, Copepoda, Cladocera and terrestrial drop-ins such as aphids. These organisms were marked for their presence (given a value of 1) only and left in the sample. They were not included towards the 300-organism subsample count.
- Where specimens are broken or damaged, only heads were counted.
- Subsampling was conducted with the use of a Marchant Box.
- When using the Marchant box, cells were extracted at the same time in the order indicated by a random number table. If the 300th organism was found part way into sorting a cell then the balance of that cell was sorted. If the organism count had not reached 300 by the 50th cell then the entire sample was sorted.
- The total number of cells sorted and the number of organisms removed were recorded manually on a bench sheet and then recorded into INSTAR1
- Organisms were stored in vials containing 80% ethanol and an interior label indicating the site names, date of sampling, site code numbers and portion subsampled. This information was also recorded on the laboratory bench sheet and on INSTAR1.
- The sorted portion of the debris was preserved and labeled separately from the unsorted portion and was tested for sorting efficiency (Sorting Quality Control – Sorting Efficiency). The unsorted portion was also labeled and preserved in separate jars.

Percent sub-sampled and total countable invertebrates pulled from the samples were summarized in the table below.

Table 2: Percent sub-sample and invertebrate count for each sample

Sorting Quality Control - Sorting Efficiency

As a part of Cordillera's laboratory policy, all projects undergo sorting efficiency checks.

- As sorting progresses, 10% of samples were randomly chosen by senior members of the sorting team for resorting.
- All sorters working on a project had at least 1 sample resorted by another sorter.
- An efficiency of 90 % was expected (95% for CABIN samples).
- If 90/95% efficiency was not met, samples from that sorter were resorted.
- To calculate sorting efficiency the following formula was used:

$$\frac{\#OrganismsMissed}{TotalOrganismsFound} * 100 = \% OM$$

Table 3 Summary of sorting efficiency

	Total from Sample	Percent Efficiency
Site - QC, Sample - QC 1, CC# - CC231072, Percent sampled = 6%, Sieve size = 400		
Chironomidae	1	
Total:	1	328 99.70%

	Total from Sample	Percent Efficiency
Site - QC, Sample - QC 2, CC# - CC231075, Percent sampled = 7%, Sieve size = 400		
Ephemerellidae	3	
Chironomidae	5	
Empididae	1	
Heptageniidae	1	
Trichoptera	1	
Total:	11	362 96.96%

	Total from Sample	Percent Efficiency
Site - QC, Sample - QC 3, CC# - CC231082, Percent sampled = 7%, Sieve size = 400		
Ephemerellidae	1	
Psychodidae	1	
Total:	2	318 99.37%

Sorting Quality Control - Sub-Sampling QC

Certain Provincial and Mining projects require additional sorting checks in the form of sub-sampling QC, (Environmental Effects Monitoring (EEM) protocol). This ensured that any fraction of the total sample that was examined was actually an accurate

representation of the number of total organisms. Organisms from the additional sub-samples were not identified; rather total organism count only was compared.

Sub-Sampling efficiency was measured on 10% of the number of sub-sampled samples in the project. Ex. In a project where 50 of 100 total samples were processed through subsampling using a Marchant box, then 10% of 50; or 5 samples were used for sub sampling efficiency.

Sub-Sampling efficiency was performed by fractioning the entire sample into sub-sample percentages. On each sub-sampled portion, a total organism count was recorded and compared to the rest of the sub-samples. In order to pass, all fractions were required to be within 20% of total organism count.

Example: If 300 organisms are found in 10% of the sample, the sorter will continue to sample in 10% fractions until the entire sample is separated. They will then count the total number of organisms in each of the 10 fractions of 10% and compare the organism count.

When divergence is >20% the sorting manager examines for the source of the problem and takes steps to correct it. With the Marchant box, the problem typically rested with how the box is flipped back to the upright position. For this reason, subsampling was performed by experienced employees only. Another common source of error would be the type of debris in the sample. Samples with algae or heavy with periphyton have a higher incident of failure due to clumping than clear samples.

Table 4 Summary of Sub Sample efficiency

Station ID		Organisms in Subsample																			Sorter		Actual Total	Precision		Accuracy		
CC#	Sample Name	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	By		Time	Percent Range		Min	Max

Taxonomic Effort

The next procedure was the identification to genus-species level where possible of all the organisms in the sample.

- Identifications were made at the genus/species level for all insect organisms found including Chironomidae (Based on CABIN protocol).
- Non-insect organisms (except those not included in CABIN count) were identified to genus/species where possible and to a minimum of family level with intact and mature specimens.
- The Standard Taxonomic Effort lists compiled by the CABIN manual¹, SAFIT², and PNAMP³ were used as a guide line for what level of identification to achieve where the condition and maturity of the organism enabled.
- Organisms from the same families/order were kept in separate vials with 80% ethanol and an interior label of printed laser paper.
- Chironomidae was identified to genus/species level where possible and was aided by slide mounts. CMC-10 was used to clear and mount the slide.
- Oligochaetes was identified to family/genus level with the aid of slide mounts. CMC-10 was used to clear and mount the slide.
- Other Annelida (leeches, polychaetes) were identified to the family/genus/species level with undamaged, mature specimens.
- Mollusca was identified to family and genus/species where possible
- Decapoda, Amphipoda and Isopoda were identified at family/genus/species level where possible.
- Bryozoans and Nemata remained at the phylum level
- Hydrachnidae and Cnidaria were identified at the family/genus level where possible.
- When requested, reference collections were made containing at least one individual from each taxa listed. Organisms represented will have been identified to the lowest practical level.
- Reference collection specimens were stored in 55 mm glass vials with screw-cap lids with polyseal inserts (museum quality). They were labeled with taxa name, site code, date identified and taxonomist name. The same information was applied to labels on the slide mounts.

Taxonomists

The taxonomists for this project were certified by the Society of Freshwater Science (SFS) Taxonomic Certification Program at level 2 which is the required certification for CABIN projects:

Scott Finlayson: Group 1 General Arthropods (East/West); Group 2 EPT (East/West);
Group 3 Chironomidae (East/West); Group 4 Oligochaeta

Adam Bliss: Group 1 General Arthropods (East/West); Group 2 EPT (East/West); Group 3 Chironomidae

Rita Avery: Group 1 General Arthropods (East/West); Group 2 EPT (East/West)

Taxonomic QC

Taxonomic QC was performed in house by someone other than the original taxonomist.

- Quality control protocol involved complete, blind re-identification and re-enumeration of at least 10% of samples by a second SFS-certified taxonomist.
- Samples for taxonomic quality control were randomly selected and quality control procedures were conducted as the project progresses through the laboratories.
- The second (QC) taxonomist will calculate and record four types of errors:
 1. Misidentification error
 2. Enumeration error
 3. Questionable taxonomic resolution error
 4. Insufficient taxonomic resolution error

The QC coordinator then calculates the following estimates of taxonomic precision.

1. The percent total identification error rate is calculated as:

$$\frac{\text{Sum of incorrect identifications}}{\text{total organisms counted in audit}} * (100)$$

The average total identification error rate of audited samples did not exceed 5%. All samples that exceed a 5% error rate were re-evaluated to determine whether repeated errors or patterns in error contributed.

2. The percent difference in enumeration (PDE) to quantify the consistency of specimen counts.

$$PDE = \frac{|n_1 - n_2|}{n_1 + n_2} \times 100$$

3. The percent taxonomic disagreement (PTD) to quantify the shared precision between two sets of identifications.

$$PTD = \left(1 - \left[\frac{a}{N}\right]\right) \times 100$$

4. Bray Curtis dissimilarity Index to quantify the differences in identifications.

$$BC_{ij} = 1 - \frac{2C_{ij}}{S_j + S_i}$$

Error Summary

All samples report errors within the acceptable limits for CABIN Laboratory methods (less than 5% error).

Table 5 Summary of taxonomic error following QC

Site	Taxa Identified	% Error	PDE	PTD	Bray - Curtis Dissimilarity index
Site - 2022, Sample - RG_BOCK_BIC-2_2022-09-15_N, CC# - CC231067, Percent sampled = 5%, Sieve size = 400	357	0.00	0.14025245	0.56022409	0.00420757
Site - 2022, Sample - RG_MI3_BIC-1_2022-09-12_N, CC# - CC231072, Percent sampled = 6%, Sieve size = 400	326	0.00	0.3058104	0.91463415	0.00611621
Site - 2022, Sample - RG_MICOMP_BIC-2_2022-09-18_N, CC# - CC231088, Percent sampled = 5%, Sieve size = 400	315	0.00	0.3164557	0.94637224	0.00632911

There will always be disagreements between taxonomists regarding the degree of taxonomic resolution in immature specimens and when laboratories make use of different keys for certain groups (Mollusks is an especially disputed group). It is always possible that some taxa found by the original taxonomist were overlooked in QC.

All of the Taxonomic QC samples that were observed passed testing according to the CABIN misidentification protocols. See the tables below for results from taxonomic QC audit.

Taxonomic Keys

Below is a reference list of taxonomic keys utilized by taxonomists at Cordillera Consulting. Cordillera taxonomists routinely seek out new literature to ensure the most accurate identification keys are being utilized. This is not reflective of the exhaustive list of resources that we use for identification. A more complete list of taxonomic resources can be found at Southwest Association of Freshwater Invertebrate Taxonomists. (2015).
