Report: Elkview Operations (EVO) Local Aquatic Effects Monitoring Program (LAEMP), 2022

Overview: This report monitors aquatic conditions related to ongoing mining and the commissioning of the Elkview Operations Saturated Rock Fill (EVO SRF).

This report was prepared for Teck by Minnow Environmental Inc.

EXECUTIVE SUMMARY

The Elkview Operations Local Aquatic Effects Monitoring Program (EVO LAEMP) was designed to evaluate changes related to the commissioning of the Saturated Rock Fill (SRF). As per section 8.3.5 in Permit 107517, the EVO LAEMP is focused on the immediate receiving environment downstream of the EVO SRF including Erickson, Gate, Bodie, and Michel creeks. The EVO LAEMP is intended to monitor for changes in water quality, calcite, and temperature in the receiving environment downstream of the EVO SRF and how these changes may have potential effects to the biota. After starting the EVO SRF trials in 2018 (EVO SRF Phase 1; discharge to Gate and Bodie creeks), the EVO SRF started treating Erickson Creek water as part of Phase 2 (referred to as EVO SRF P2) on February 15, 2021. During EVO SRF P2 in 2021, water was discharged from the SRF back into Erickson Creek, with limited discharge from the SRF to Bodie and Gate creeks.

Sampling completed in September 2021 showed unexpected tissue selenium concentrations immediately downstream of the SRF outfall in Erickson Creek. Results from confirmatory sampling initiated by Teck's Adaptive Management Plan (AMP) response framework, and ongoing monthly investigative sampling was started in April 2022. On April 9, 2022, discharge of the SRF to Erickson Creek was paused to complete planned maintenance on the Erickson effluent pipeline. Due to the high BIT Se results observed in Erickson Creek, it was determined, through Teck's AMP framework, that treatment of Erickson Creek water would remain paused to further investigate the cause of the increased BIT Se concentrations. Benthic invertebrate tissues selenium concentrations returned to pre-SRF P2 levels by October 2022. The extended downtime allowed Teck to develop a robust trigger response plan (TRP) to support the restart of Erickson Creek treatment (Teck 2023a). A TRP was submitted October 3, 2022, with the discharge of treated effluent to Erickson Creek restarting on October 4, 2022. The results from the investigative sampling (until restart on October 4, 2022) were shared in the Elkview Operations Saturated Rock Fill (EVO SRF): Investigation Into Enhanced Selenium Bioaccumulation in Benthic Invertebrate Tissue in Erickson Creek Summary Report on May 4, 2023 (Teck 2023a). The EVO LAEMP report is focused on 6 specific questions related to the influence of the EVO SRF on Erickson, Gate, Bodie, and Michel creeks in 2022.

Study question # 1 (Has temperature changed in the receiving environment of Erickson Creek as the result of SRF water treatment?) was evaluated using continuous temperature data loggers installed in Erickson Creek. Water temperature in Erickson Creek downstream of the SRF was influenced by SRF operation in 2022; however, the effects were temporally constrained due to SRF shutdown during the summer months when the greatest SRF influence on water temperature (i.e., a significant increase downstream of the SRF outfall compared to upstream) was observed

in 2021 (Minnow 2022). Considering there were no observed effects on biological endpoints (i.e., BIC and productivity) that could be linked to the variability in the water temperature and water temperatures did not exceed permit or BCWQG downstream of the SRF, it is unlikely that this variability was ecologically significant in 2022.

Study Questions #2 (Has calcite in the receiving environment (Erickson, Bodie, Gate, and Michel creeks) been influenced by SRF water treatment and/or calcite prevention (e.g. antiscalant efforts?) was evaluated using calcite presence data collected during both the EVO LAEMP benthic invertebrate community (BIC) sampling as well as the Regional Calcite Program. Calcite presence in the receiving environment (Erickson, Gate, and Bodie creeks) was largely similar to previous years (pre-EVO SRF P2) in 2022, based on observations from the present study as well as the Regional Calcite Monitoring Program. Calcite presence in Michel Creek has been variable at all areas assessed under the LAEMP; however, calcite concretion and calcite index scores have remained low. Antiscalant treatment has been variable in all areas (Erickson, Gate, and Bodie creeks) and thus no conclusions around the cause of calcite variability among years associated with antiscalant dosing can be made in 2022.

Study Question #3 (Has SRF water treatment and/or calcite prevention (e.g., antiscalant) (a) decreased aqueous concentrations of selenium and nitrate and/or (b) changed other mine-related constituents in effluent and the receiving environment (Erickson, Bodie, Gate, and Michel creeks?) was evaluated through monitoring of water chemistry, including selenium speciation concentrations, throughout the EVO LAEMP study area. In 2022, the SRF removed 672 kg of selenium and 89,292 kg of nitrate decreasing selenium and nitrate loadings into the receiving environment. During SRF operation in 2022, concentrations of selenium and nitrate decreased in the receiving environment of Erickson Creek as well as Gate and Bodie creeks. In contrast, concentrations of selenium and nitrate in Michel Creek did not change concurrently with changes in SRF operation but has decreased from pre-SRF operation (nitrate) or remained similar to pre-SRF operation (selenium). A number of other mine-related constituents increased in the receiving environment (i.e., Erickson, Gate and Bodie creeks) downstream of the SRF treatment following operation, due to changing sources of influent. All of the constituents that increased, except for dissolved nickel and uranium, were below the available water quality criteria in Erickson Creek (Proposed Benchmarks and BCWQG, respectively). Increases in these constituents are likely due to higher concentrations present in water directed to the SRF for treatment from Natal Pit. The elevated concentrations are spatially constrained to Erickson, Gate and Bodie Creeks and similar trends are not observed in Michel Creek suggesting that the SRF had a minimal influence in the downstream receiving environment. Along with aqueous concentrations of mine-related constituents, sediment concentrations were monitored as part of

the EVO LAEMP. The elevated sediment metal (i.e., arsenic, cadmium, iron, manganese, nickel, selenium, and zinc) and PAH concentrations from SRF treatment also appear to be localized to a relatively small area directly downstream of the SRF outfall (RG_ERCKDT and RG_ERCKMD). In lower Erickson Creek (RG_ERCK) and Michel Creek, the concentrations of the majority of sediment constituent concentrations are similar to concentrations pre-SRF treatment and within regional normal ranges suggesting that the SRF had minimal influence on sediment chemistry in the downstream receiving environment.

Study Question #4 (Have benthic invertebrate tissue selenium concentrations changed as a result of the SRF in Erickson, Bodie, Gate, and Michel creeks?) was evaluated through the monitoring of composite-taxa benthic invertebrate tissue selenium concentrations throughout the study area monthly March through to the end of the year. A detailed analysis of the causal factors associated with changing BIT Se concentrations can be found in the 'Investigation Into Enhanced Selenium Bioaccumulation in Benthic Invertebrate Tissue in Erickson Creek' (Teck 2023a). Mean BIT selenium concentrations in Gate and Bodie creeks, were occasionally greater than the Level 1, 2, and 3 benchmarks for effects to benthic invertebrates in 2022. Additionally, the mean BIT Se concentrations immediately downstream of the SRF outfall in Erickson Creek often exceeded the EVWQP Level 1 benchmarks during the additional sampling events associated with the Erickson Creek selenium investigation and occasionally exceeded the EVWQP Level 2 and Level 3 benchmarks in the late winter and early spring before treatment was paused. Benthic invertebrate tissues selenium concentrations returned to pre-SRF P2 levels by October 2022. The Investigation into Enhanced Selenium Bioaccumulation in Benthic Invertebrate Tissue in Erickson Creek identified strong evidence that SRF-derived particles are the primary driver of the observed BIT Se increase in upper Erickson Creek. The influence of the SRF on BIT selenium concentrations was isolated to directly below the SRF outfall in Erickson Creek. In contrast, mean BIT selenium concentrations at the confluence of Erickson Creek and Michel Creek and the study areas in Michel Creek were all below EVWQP benchmarks.

Study Question #5 (Are there changes in the benthic invertebrate community in Erickson, Bodie, Gate, and Michel creeks associated with SRF treatment (including calcite prevention)?) was evaluated through monitoring of BIC endpoints. BIC endpoints including taxa richness and % EPT (Ephemeroptera, Plecoptera, and Trichoptera) were lower than reference and below regional and/or habitat-adjusted normal ranges at some areas in Erickson Creek in 2022. Investigation of spatial and temporal trends indicated that these differences were either observed both up- and downstream of the SRF outfall (e.g., decrease in % EPT at both RG_ERCKUT and RG_ERCKDT) and/or were observed prior to commissioning for EVO SRF P2 (e.g., lower taxa richness at RG_ERCKUT; lower % EPT at RG_ERCK). Overall, while changes in BIC were apparent in Michel Creek (i.e., decrease in %EPT), these changes have been variable through

time and are not aligned with known changes in SRF operation, indicating minimal effects of the SRF. Total abundance and abundance of key BIC endpoints (EPT abundance) remained high throughout the study area, resulting in no limitations of food available to fish in fish bearing areas of Erickson or Michel creeks.

Study question #6 (Is SRF water treatment affecting indicators of productivity (e.g., phosphorus) in the receiving environment?) was evaluated through monitoring changes in phosphorus, benthic invertebrate density, and biomass and periphyton coverage. Concentrations of total phosphorus increased downstream of the SRF outfall in Erickson Creek in 2022 (SRF shutdown for six months) compared to 2021 (SRF discharging). No changes in BIC biomass and density were apparent in 2022, most likely due to SRF shutdown during the growing season leading to lower temperatures at that time compared to 2021. Mean periphyton coverage was moderate at the reference study area (RG_ALUSM) and at all mine-exposed study areas evaluated, except RG_ERCK, and RG_BOCK, where periphyton was high and low, respectively and there were no patterns in visual periphyton score associated with SRF discharge in 2022. There were no changes in productivity associated with SRF operation in 2022 in Erikson, Gate, Bodie and Michel creeks.

Overall, in 2022, the SRF removed 89,292 kg of nitrate and 672 kg of selenium decreasing selenium and nitrate loadings into the receiving environment. During SRF operation, concentrations of nitrate and selenium decreased in Erickson Creek as well as Gate and Bodie creeks. In Michel Creek concentrations of nitrate have decreased from base year of monitoring, likely due to SRF treatment. As expected in 2022, during SRF shutdown in Erickson Creek, temperature, and benthic proxies of productivity (i.e., benthic biomass and density) returned to pre-SRF P2 operation conditions. While the changes observed in water quality, temperature, and productivity in 2022 were expected based on SRF operational status, changes in calcite presence and benthic invertebrate community were less clear. Calcite in the receiving environment (Gate, Bodie, and Erickson creeks) was largely similar to pre-EVO SRF P2 operation in 2022; however, it is unclear if the shifts in 2022 compared to 2021 were related to SRF operation and subsequent changes to antiscalant treatment, shutdown during the spring and summer of 2022 precludes any conclusions around the cause of calcite variability among years. Lastly, while effects to benthic invertebrate community in relation to reference normal ranges were apparent in Erickson Creek and Michel Creek, they were either present prior to SRF commissioning, have not changed substantially over time, and/or have been variable through time in a manner inconsistent with SRF operation, indicating multiple influences, both natural and stressor-related, on BIC, and suggests minimal effects of SRF operation. Additional years of data will be beneficial to assess changes in calcite and BIC associated with SRF water treatment.

Results of the 2022 EVO LAEMP provide information that supports Teck's AMP and informs future monitoring and management efforts.

LPL – Lowest Practical Level, referring to taxonomic identification of benthic invertebrates

LRL – Laboratory Reporting Limit

MOD – Magnitude of Difference

P1 – Phase 1

P2 – Phase 2

PAH – Polycyclic Aromatic Hydrocarbons

PDF – Portable Document Format

QA/QC – Quality Assurance / Quality Control

RAEMP – Regional Aquatic Effects Monitoring Program

R.P. Bio. – Registered Professional Biologist

SME – Subject Matter Expert

SPO – Site Performance Objective

SRF – Saturated Rock Fill

TIE - Toxicity identification evaluation

TOC – Total Organic Carbon

WCT – Westslope Cutthroat Trout

1 INTRODUCTION

1.1 Background

Teck Coal Limited (Teck) operates four mines in the Elk River watershed to extract steel-making coal. The four mines are the Fording River Operation (FRO), Greenhills Operation (GHO), Line Creek Operation (LCO), and Elkview Operation (EVO; Figure 1.1). A fifth mine, Coal Mountain Mine (CMm), is also owned by Teck and located in the Elk River watershed; however, it is no longer in operation and has been moved into the care and maintenance designation. Discharges from the mines to the Elk River watershed are authorized by the British Columbia Ministry of Environment and Climate Change Strategy (ENV) through permits that are periodically issued under provisions of the *Environmental Management Act*. Permit 107517¹ specifies the terms and conditions associated with discharges from Teck's five Elk Valley mine operations and includes requirements for regional and local aquatic effects monitoring programs.

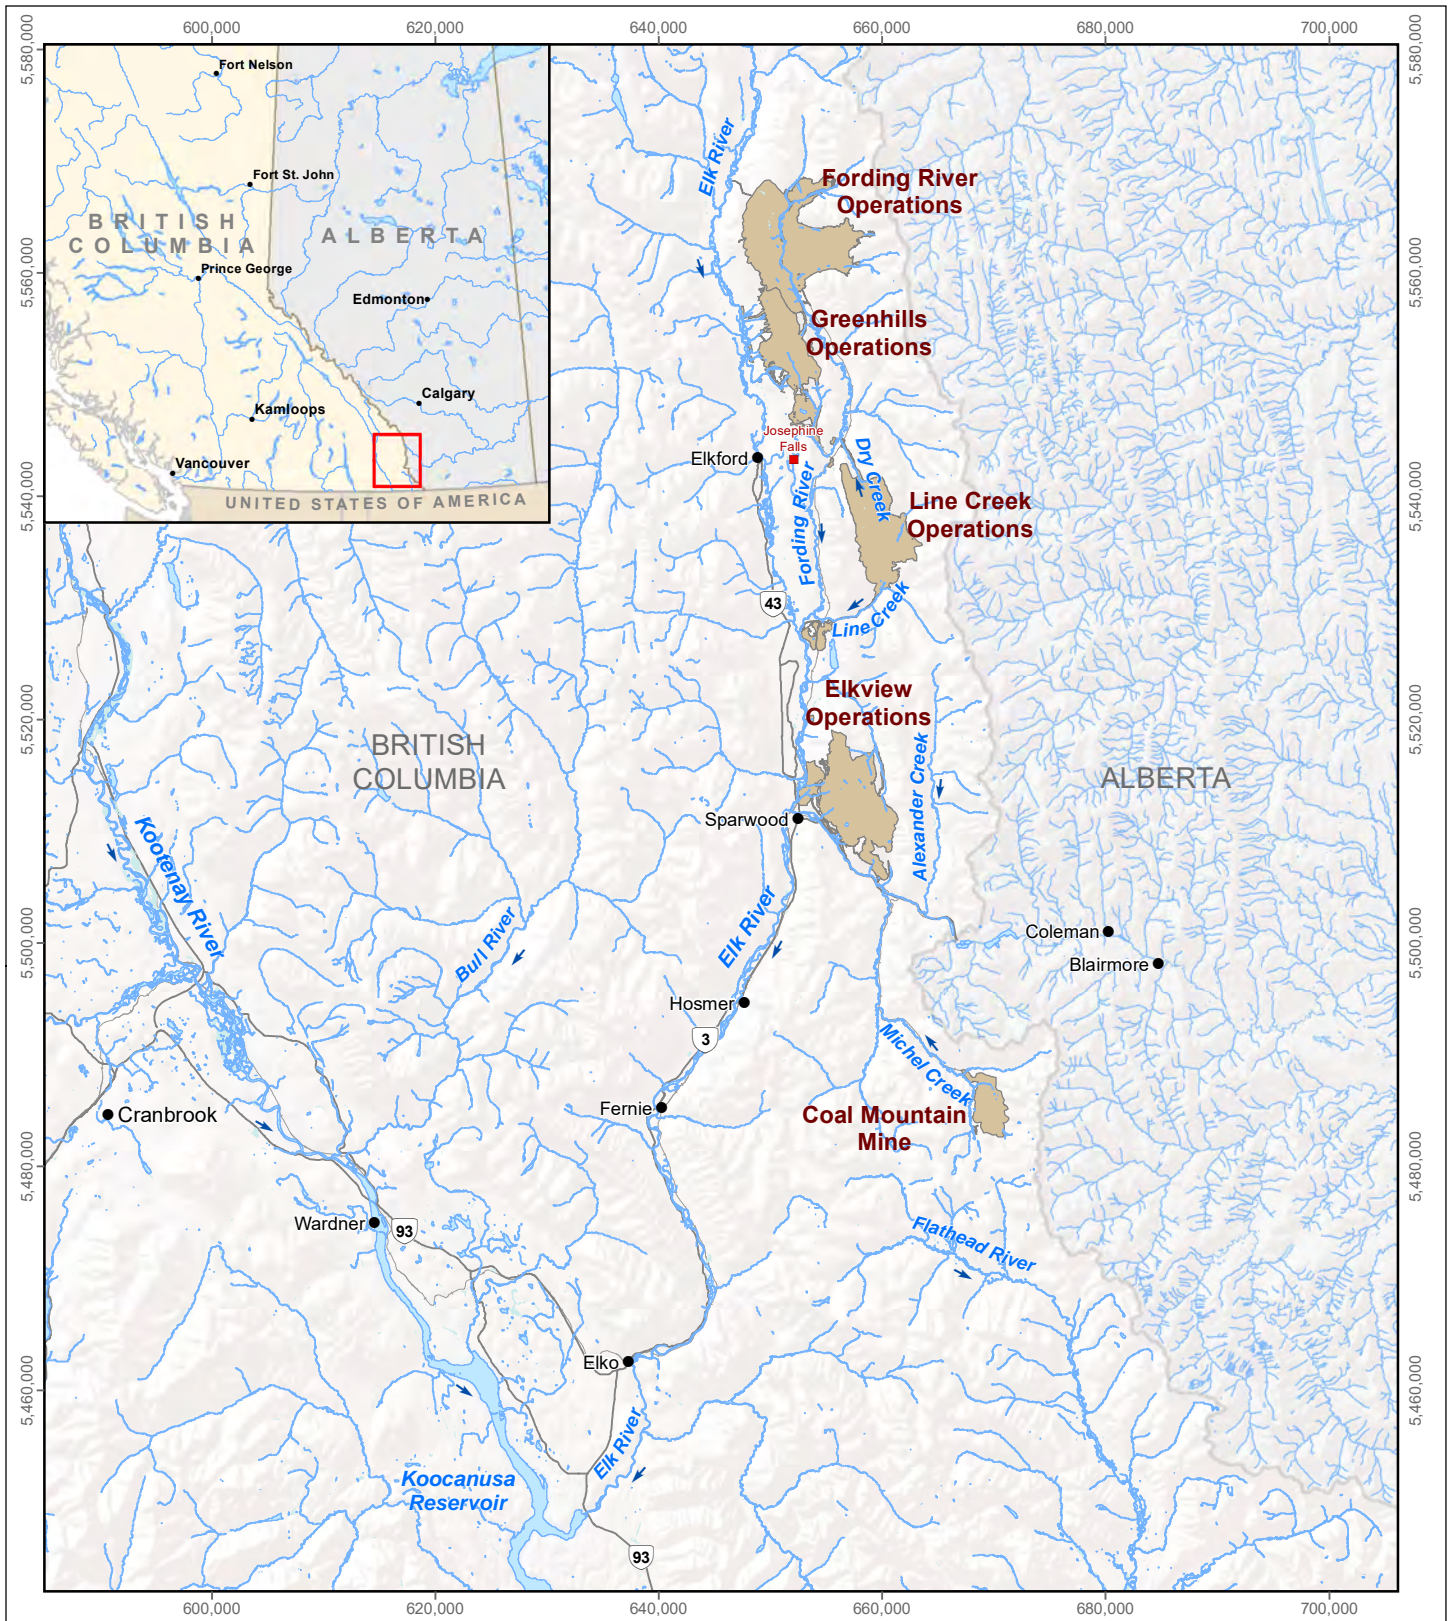

This report satisfies the annual commitments in section 8.3.5 of Permit 107517 that outlines the requirements for the EVO Local Aquatic Effects Monitoring Program (LAEMP) as follows:

“The permittee must develop and implement a LAEMP to determine the magnitude and extent of influence from EVO SRF (Saturated Rock Fill) discharge on water quality (including temperature), calcite and benthic invertebrate communities to assess what factors are contributing to the observed effects. The study design must be reviewed by the EMC² and submitted to the director for approval by June 30, 2021. The LAEMP must be designed to an appropriate temporal scale to capture short term, local effects to the immediate receiving environment, and must consider the possibility of impacts resulting from potential selenium speciation.”

¹ Permit 107517 was initially issued on November 19, 2014, but has been amended on numerous occasions with the most recent revisions occurring on May 18, 2023.

² EMC refers to the Environmental Monitoring Committee, which Teck was required to form under Permit 107517. The EMC consists of representatives from Teck, ENV, the Ministry of Energy and Mines, Environment Canada, the Ktunaxa Nation Council, Interior Health Authority, and an independent scientist. Environment Canada has agreed to provide input on a case-by-case basis when requested by the other members of the EMC but has not yet been called upon to participate. The EMC reviews submissions and provides technical advice to Teck and the ENV Director regarding monitoring programs.

Figure 1.1

The study design was approved on October 15, 2021, and then amended on March 4, 2022³. Section 9.5 of Permit 107517 states:

The LAEMP Annual Reports must be reported on in accordance with generally accepted standards of good scientific practice in a written report and submitted to the Director by June 30 of each year following the data collection calendar year.

In addition to local monitoring under the LAEMP, Teck's Regional Aquatic Effects Monitoring Program (RAEMP) provides comprehensive routine monitoring and assessment of potential mine-related effects on the aquatic environment downstream from Teck's mines in the Elk Valley (i.e., annual sampling and more comprehensive monitoring every three years). Data collected under the EVO LAEMP is incorporated into RAEMP reporting.

Teck conducts a variety of additional programs to monitor, evaluate, and/or manage the aquatic effects of mining operations, within the EVO LAEMP study area those include:

- Water Quality Monitoring;
- Regional Calcite Monitoring, under Calcite Management Plan;
- Fish and Fish Habitat Management;
- Chronic Toxicity Testing Program;
- Tributary Management, under the Tributary Management Plan;
- Adaptive Management, under the Adaptive Management Plan;
- Regional and Site-Specific Groundwater Monitoring Programs;
- Environmental Flow Needs (EFN) Studies;
- Flow Accretion Studies; and
- Elkview Operational and Treatment Facilities Reporting.

The EVO LAEMP assesses site-specific conditions as it relates to Saturated Rock Fill (SRF) operation on a more frequent and localized basis than the RAEMP and is spatially restricted to Erickson (upstream and downstream of the SRF Outfall), Gate (upstream and downstream of settling pond), Bodie, and Michel creeks (upstream and downstream of the confluence with Erickson Creek), as well as two reference areas (located on Lower Alexander Creek and upper

³ The amended study design required sediment quality data from RG_MI3 be included in the EVO LAEMP Annual report, monthly water quality monitoring for EV_MC3a and EV_MC3, selenium bioaccumulation by benthic invertebrates for all areas included in the annual EVO LAEMP report. Additionally, monthly sampling at RG_ERCKUT was required from January to June 2022 with a statistical comparison of water quality to F2_ECIN.

Michel Creek). The LAEMP will continue as required until sufficient data have been collected to evaluate the study questions and/or relevant ongoing monitoring requirements can be incorporated into the RAEMP.

1.2 SRF Operational Timeline

A key component of Permit 107517 is the incorporation of an adaptive management approach for the advancement of research on treatment technologies to both reduce mine-related constituent loadings in the environment as well as reduce the reliance on long term active water treatment (as noted in Section 7.2 of the Permit). In accordance with this approach, Teck, in January of 2018, commenced a full-scale trial of the EVO SRF (SRF P1) for the removal of aqueous nitrate and selenium from water sourced from Natal Pit, and reported >90% removal of selenium and nitrate from influent waters with a treatment capacity of up to 10,000 m³/d (Teck 2020a, Figure 1.2). On February 22, 2018, SRF effluent discharge commenced through the Bodie Creek Rock Drain, which then flows to either Bodie or Gate creeks (Teck 2020a). Teck initiated wet testing of Erickson Creek intake/outfall structure on December 10, 2020, prior to the commissioning phase of EVO SRF P2, and during this time EVO SRF remained in recirculation as the facility continued the biomass growth stage in advance of moving into Erickson Creek forward flow (i.e. treating and discharging back to Erickson Creek) on February 15, 2021 (EVO SRF P2; Teck 2022a). The commissioning phase of the EVO SRF P2 was completed on August 13, 2021, and the facility transitioned to the operations phase on August 14, 2021. Natal pit was brought online as a supplemental influent source for Erickson Creek on November 9, 2021, to build the pit water level within the EVO SRF treatment zone. Teck began discharging treated effluent to the Gate and Bodie systems in January of 2022 (Teck 2022a).

The hydraulic design capacity of EVO SRF P2 is 21,053 m³/d (Teck 2020a), which can be sourced solely from Erickson Creek during periods of higher flow or combined with water from Natal Pit for treatment during periods of lower flow or to make up pit level (Figure 1.3). For the majority of 2021⁴, treated effluent from the SRF was returned through the outfall structure into the non-fish bearing reach of Erickson Creek (Figure 1.3), with limited discharge in Gate Creek and Bodie Creek through the Bodie rock drain. Both the Bodie and Gate Creek catchments have been considerably altered as a result of historical mining, and the original channels of significant portions of these catchments are composed of rock spoils and reclaimed slopes and are acting as rock drains (Teck 2020b). Overall, the effect of the EVO SRF P2 on the receiving environment is expected to be positive (via decreases of selenium and nitrate); however, a subset of

⁴ In 2021, the average throughput of the EVO SRF P2 was 12,604 m³/day and treated a total volume of 4,033,353m³ in 2021. EVO SRF P2 experienced 53 downtime events in 2021, with five of these events being greater than 24 hours in duration (Teck 2022a).

Figure 1.3

constituents (nickel, phosphorus, selenite, and organoselenium species) as well as temperature (Figure 1.4; Erickson Creek only) could increase in the receiving environment as a result of SRF treatment (Golder 2020a, Teck 2020a).

Prior to commissioning of the SRF, studies were conducted to investigate fish habitat and usage (Robinson 2009, Wilkinson 2009, Lotic 2015, and Ecofish 2020) in Gate, Bodie, Erickson, and Michel creeks. In short, results from these studies demonstrated a lack of suitable habitat for fish in these areas. As well, Bodie and Gate creeks routinely undergo fish salvages and have suspected fish barriers⁵, while upper portions of Erickson Creek (referred to as Reach 2) are above two natural fish barriers (i.e., 2 m waterfall) present approximately 290 m upstream of the confluence of Michel Creek. Although fish (specifically Westslope Cutthroat [WCT] and Bull Trout) have been documented in lower portions of Erickson Creek (i.e. below the upstream natural barrier, referred to as Reach 1), this area contains poor fish habitat and likely only provides summer foraging habitat for fish from Michel Creek (Ecofish 2020). Additional existing condition studies evaluating water and sediment quality, benthic invertebrate community, and benthic invertebrate tissue (BIT) demonstrated that Gate, Bodie, and Erickson creeks) had elevated concentrations of aqueous selenium, nitrate, and other water quality constituents greater than Elk Valley Water Quality Plan (EVWQP) benchmarks and/or British Columbia Water Quality Guidelines (BCWQGs; (Minnow 2020a⁶, 2021a). Elevated concentrations of selenium in benthic invertebrate tissue in Gate and Bodie creeks was also recorded in the existing condition studies (Minnow 2020a, 2021a). In Michel Creek, most water quality constituents were below relevant Elk Valley Water Quality Plan (EVWQP) benchmarks/BCWQGs and benthic invertebrate community (BIC) metrics were within regional reference normal ranges.

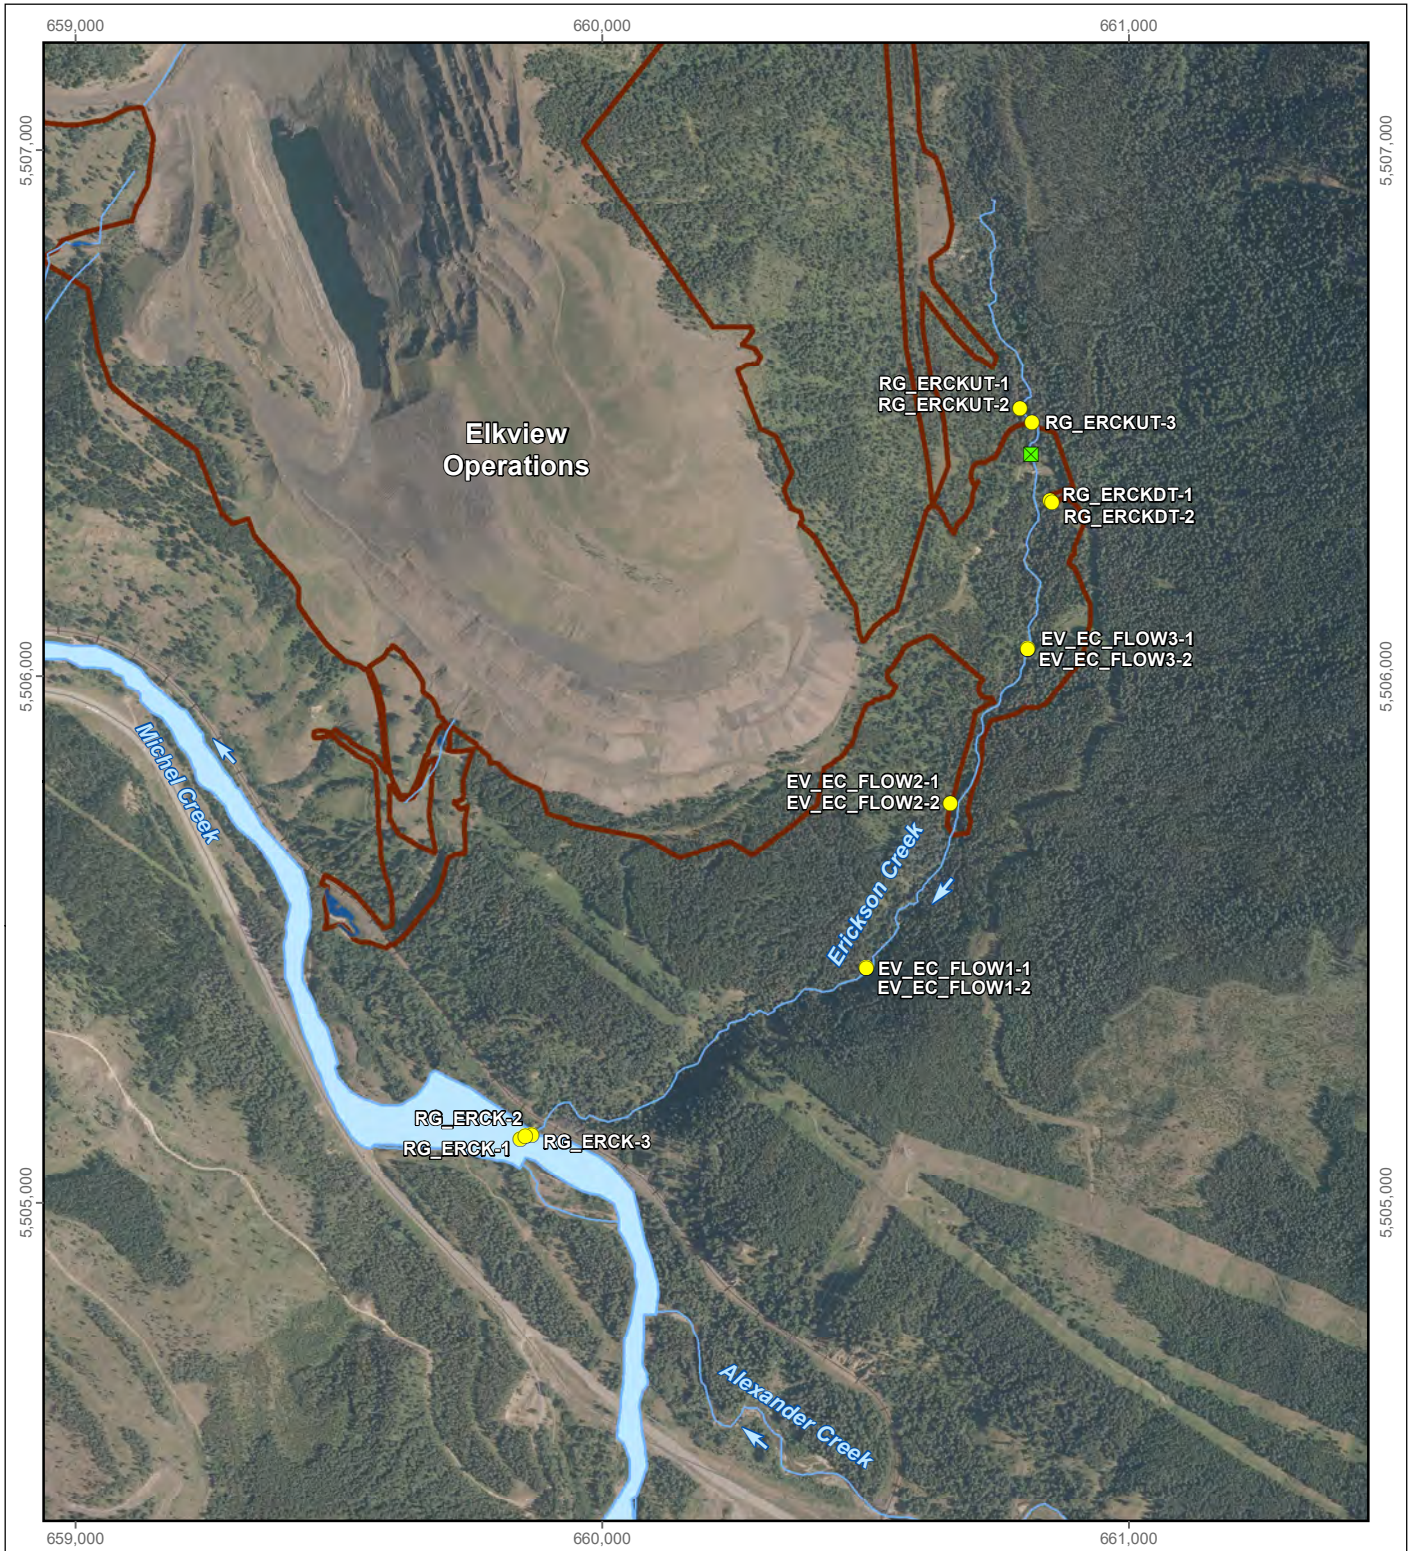

Sampling completed in September 2021 showed that mean tissue selenium concentrations in benthic invertebrates were elevated above Level 1 benchmarks for benthic invertebrates (for growth, reproduction, and survival) at RG_ERCKDT⁷. Confirmation sampling was conducted in December 2021 and March 2022 in multiple sampling areas in Erickson Creek including

⁵ Teck also routinely conducts fish salvage efforts in Bodie and Gate creeks (which are constructed discharge channels) to manage fish exclusion from these areas (Teck 2020a)

⁶ The term “baseline” was previously used when evaluating the existing conditions of the EVO area (Minnow 2020a). As mining was already established in this area, the term “baseline” has been updated to “existing conditions” to more accurately describe the nature of the data collected.

⁷ Benthic invertebrate tissue selenium concentrations were also elevated above benchmark values for benthic invertebrates (for growth, reproduction and survival) in Gate Creek (RG_GATE >Level 2 benchmark and RG_GATEDP >Level 1 benchmark) and Bodie Creek (RG_BOCK >Level 3 benchmark). However, discharge of the SRF was limited in Bodie or Gate Creek in 2021, and thus elevated selenium concentrations in BIT at these areas are not believed to be caused by SRF treatment. Furthermore, concentrations in Bodie Creek (at RG_BOCK) are similar to those pre-SRF (2015 and 2016).

Figure 1.4

RG_ERCKUT, RG_ERCKDT, and RG_ERCK. Results from the confirmatory sampling initiated Teck's Adaptive Management Plan (AMP) response framework, and ongoing monthly investigative sampling was initiated in April 2022. Additionally, in December 2021 a fourth sampling area was added to Erickson Creek (RG_ERCKMD) located midway between RG_ERCKDT and RG_ERCK, to increase the spatial resolution of BIT selenium concentration data (Figure 1.3).

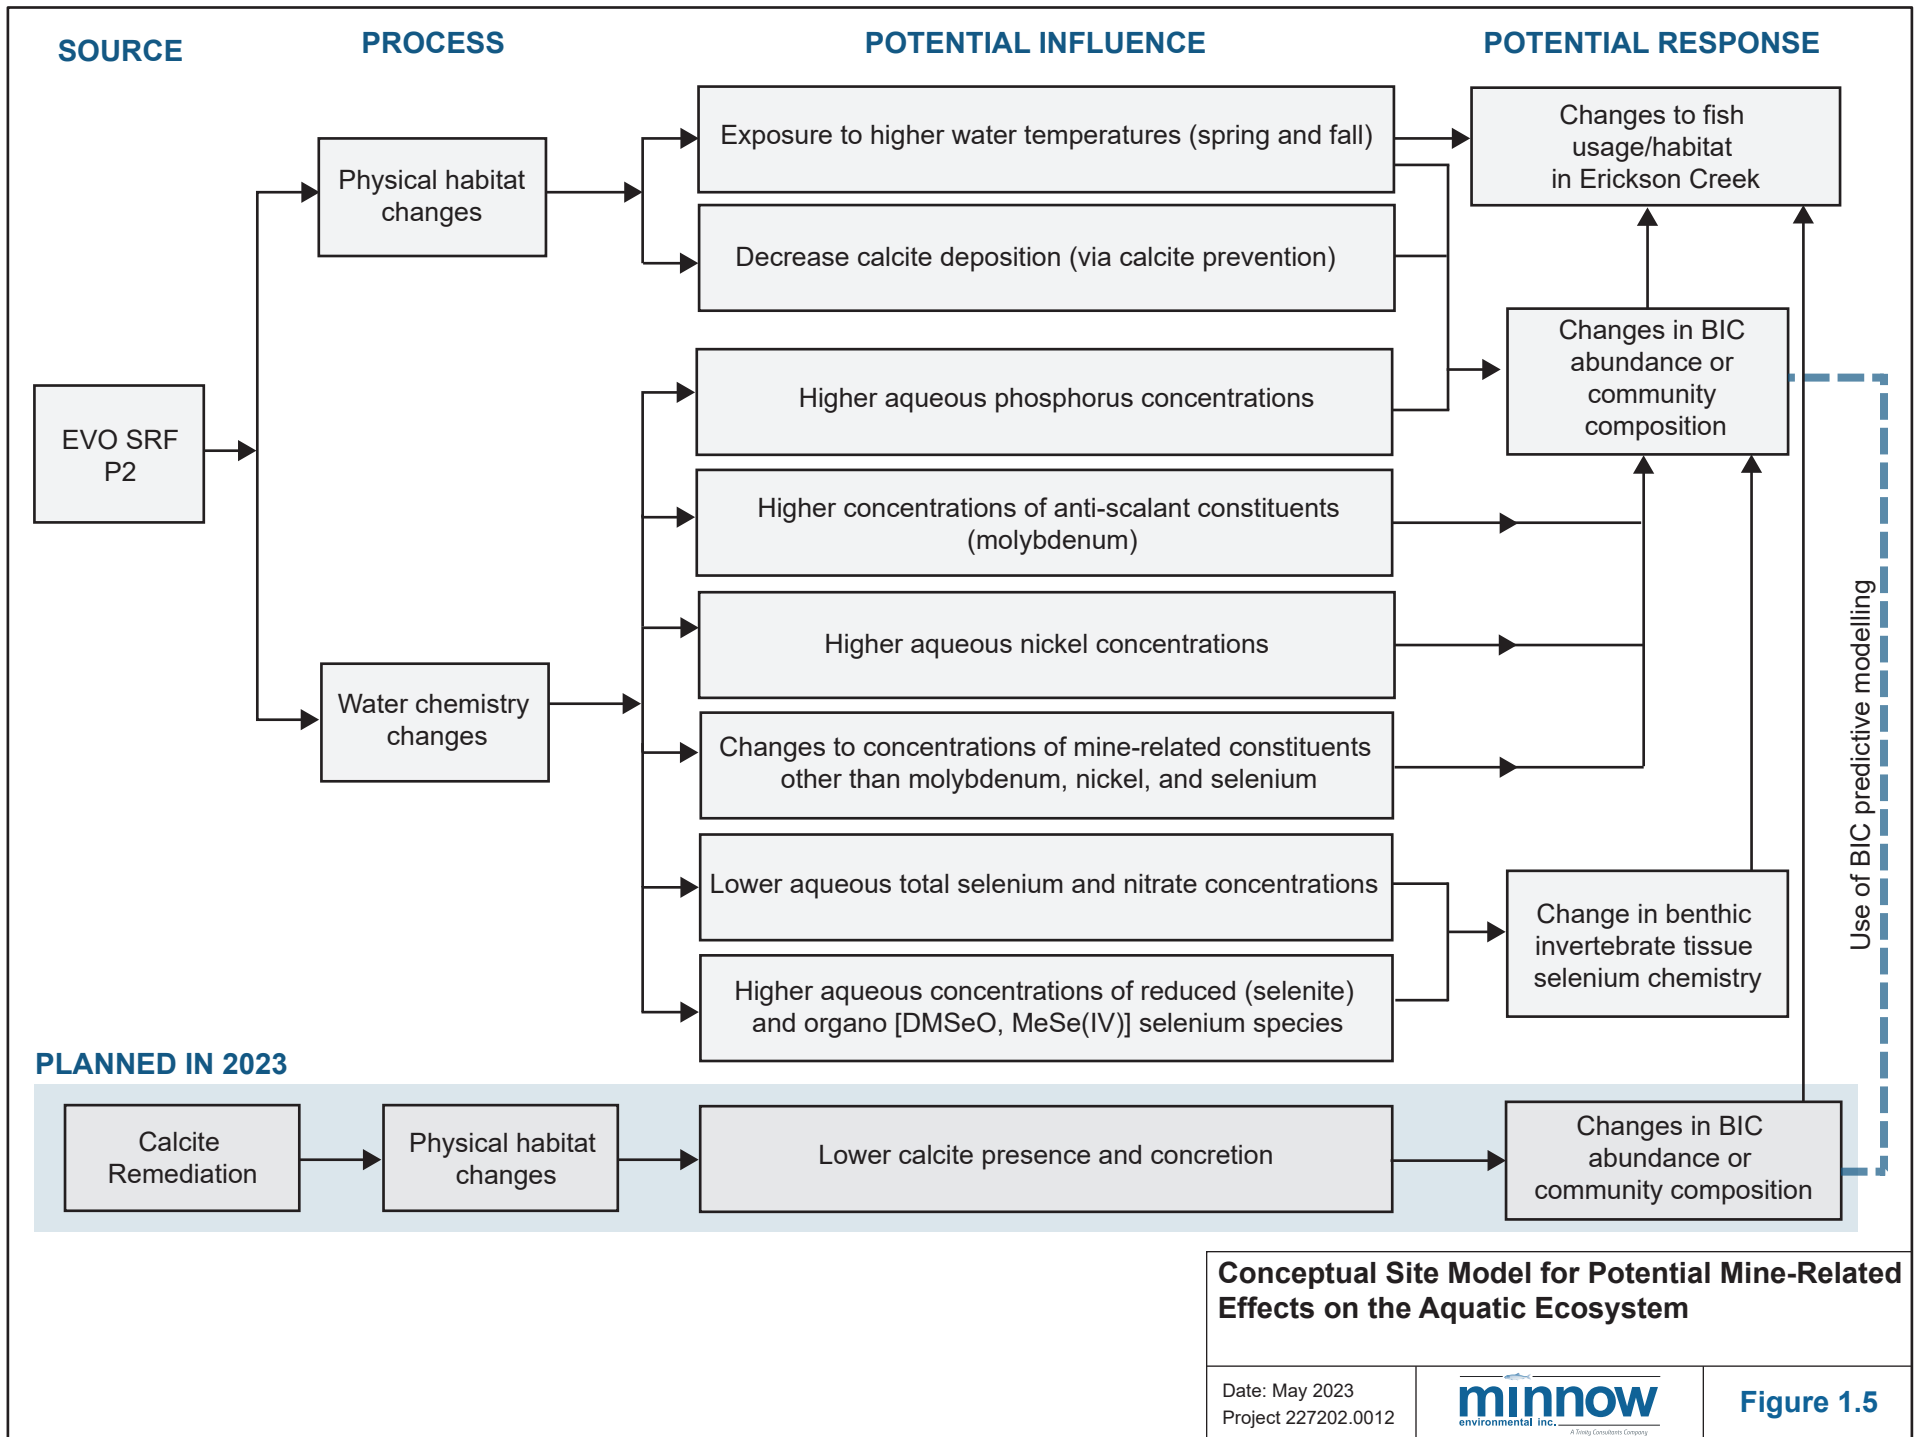

On April 9, 2022, discharge of the SRF to Erickson Creek was paused to complete planned maintenance on the Erickson effluent pipeline. Due to the high BIT Se results observed in Erickson Creek, it was determined through Teck's AMP framework that treatment of Erickson Creek water would remain paused to further investigate the cause of the increased BIT Se concentrations. The extended downtime allowed Teck to develop a robust trigger response plan (TRP) to support the restart of Erickson Creek treatment (Teck 2023a). A TRP was submitted October 3, 2022, with the discharge of treated effluent to Erickson Creek restarting on October 4, 2022. The results from the investigative sampling (until restart on October 4, 2022) were shared in the Elkview Operations Saturated Rock Fill (EVO SRF): Investigation Into Enhanced Selenium Bioaccumulation in Benthic Invertebrate Tissue in Erickson Creek Summary Report on May 4, 2023a).

1.3 Study Questions

As illustrated by the conceptual site model (CSM; Figure 1.5), the EVO LAEMP was primarily designed to assess the magnitude and extent of influence from the EVO SRF in receiving environment (Erickson, Bodie, Gate, and Michel creeks; Figure 1.3) on water quality (including temperature [Figure 1.5]), calcite, benthic invertebrate communities, and BIT selenium chemistry. The objective of the EVO LAEMP, together with the results from SRF Trial, the existing conditions studies, and EMC engagement (Minnow 2020a, Minnow 2021a) led to the development of the following study questions:

1. Has temperature changed in the receiving environment of Erickson Creek as the result of SRF water treatment?
2. Has calcite in the receiving environment (Erickson, Bodie, Gate, and Michel creeks) been influenced by SRF water treatment and/or calcite prevention (e.g. antiscalant) efforts?
3. Has SRF water treatment and/or calcite prevention (e.g. antiscalant) (a) decreased aqueous concentrations of selenium and nitrate and/or (b) changed other mine-related constituents in effluent and receiving environment (Erickson, Bodie, Gate, and Michel creeks)?

4. Have benthic invertebrate tissue selenium concentrations changed as a result of the SRF in Erickson, Bodie, Gate, and Michel creeks?
5. Are there changes in the benthic invertebrate community in Erickson, Bodie, Gate, and Michel creeks associated with SRF treatment (including calcite prevention)?
6. Is SRF water treatment affecting indicators of productivity (e.g. phosphorus) in the receiving environment?

1.4 Linkages to the Adaptive Management Plan for Teck Coal in the Elk Valley

Teck has developed an Adaptive Management Plan (AMP) to support implementation of the EVWQP to achieve water quality and calcite targets, to be protective of human health and the environment, and where necessary, restorative, and to facilitate continuous improvement of water quality in the Elk Valley (Teck 2018). Following an adaptive management framework, the AMP identified six Management Questions that are re-evaluated at regular intervals as part of AMP updates throughout EVWQP implementation. Data from the RAEMP (Minnow 2020b) and the various LAEMPs (including the EVO LAEMP) feed into the adaptive management process to address these Management Questions that collectively address the environmental management objectives of the AMP (Teck 2018) and the EVWQP (Teck 2014). The AMP also identifies key uncertainties that need to be reduced to fill gaps in current understanding and support achievement of the EVWQP objectives.

The EVO LAEMP was primarily designed to monitor conditions associated with the SRF operation and to answer site-specific questions on an annual basis (Section 1.3). Management actions as part of an AMP response framework may be triggered at any time during the course of each annual LAEMP cycle (results are reported on June 30th of each year for the preceding calendar year) depending on the answers to site-specific LAEMP questions and on available data. In the 2021/22 AMP Report a key AMP response to unexpected BIT selenium concentrations was conducted as part of the EVO LAEMP. For example, the EVO LAEMP Question #4 is: “Have benthic invertebrate tissue selenium concentrations changed as a result of the SRF in Erickson, Bodie, Gate, and Michel creeks?”. Monitoring in September 2021 identified that despite decreased total selenium concentrations below the SRF outfall (as well as other areas downstream in Erickson Creek), tissue selenium concentrations in benthic invertebrates were elevated in the nearest sampling areas downstream of the SRF outfall, RG_ERCKDT. Confirmatory sampling in December 2021 and March 2022 showed BIT Se concentrations above the level 1, and in some cases, level 2 and 3 benchmarks. BIT Se enrichment was restricted to upstream reaches in Erickson Creek; no changes compared to pre- EVO SRF P2 conditions were detected in BIT Se from Erickson Creek near the mouth (RG_ERCK) nor in Michel Creek

(RG_MIDER), indicating a localized effect. Water treatment of Erickson Creek was paused in early April 2022 for planned maintenance and extended as an adaptive management response to mitigate further increases in BIT Se during the investigation into the cause of the increased BIT Se concentrations. Shortly after treatment was paused, BIT Se concentrations decreased in upper Erickson and reached pre-SRF concentrations by October 2022. Finally, additional BIT, water quality, sediment, periphyton, and bryophyte sampling events have also been implemented, as part of the AMP response framework, to allow for a more detailed understanding of SRF performance and stabilization (starting in March 2022). The results from the investigative sampling (until restart on October 4, 2022) were shared in the Elkview Operations Saturated Rock Fill (EVO SRF): Investigation Into Enhanced Selenium Bioaccumulation in Benthic Invertebrate Tissue in Erickson Creek Summary Report on May 4, 2023 (2023a).

In addition to addressing questions specific to the EVO LAEMP on an annual basis, monitoring data from the LAEMP will contribute to the broader data set assessed every three years within the RAEMP. The RAEMP is primarily designed to evaluate Management Question #5 of the AMP (i.e., “Does monitoring indicate that mine-related changes in aquatic ecosystem conditions are consistent with expectations?”). Data from the RAEMP is also used in the evaluation of Management Question #2, (i.e., “Will aquatic ecosystem health be protected by meeting the long-term site performance objectives?) and for each Management Question, a Key Uncertainty framework has also been developed to identify data gaps and direct future work (as described in annual AMP Reports, e.g., Teck 2020c). Information acquired from the EVO LAEMP will be used in conjunction with other studies in the Elk Valley area (including other LAEMPs and the RAEMP) to reduce these uncertainties and provide additional context to the ecological conditions of the Elk Valley area as a whole. Furthermore, monitoring as part of the EVO LAEMP will follow an adaptive approach under the AMP response framework, to inform whether further investigations or adjustments are required in future EVO LAEMP study designs.

The evaluation of biological triggers is incorporated into the current report as part of Management Question #5 of the AMP (Teck 2021a). Biological triggers were developed in consultation with the EMC for a subset of the biological monitoring endpoints that are effective indicators of changes at the ecosystem level. The purpose of the biological triggers is to quickly identify biological monitoring areas where unexpected biological conditions may be occurring that may require management action. In this LAEMP report, percent EPT (Ephemeroptera [mayflies], Plecoptera [stoneflies], and Trichoptera [caddisflies]) and composite-taxa BIT tissue selenium concentration in 2022 were assessed against their respective biological triggers (additional information and methods pertaining to this analysis can be found in Appendix G).

The fourth annual AMP report was submitted on July 31, 2022, and included monitoring data collected in 2021 (Teck 2022b). In 2021 and 2022, concentrations of aqueous total selenium, nitrate, sulfate, and cadmium met the SPO (monthly average) at the EVO Michel Creek Compliance Point (EV_MC2) and at Elk River Downstream of Michel Creek Order Station (EV_ER1) nitrate exceeded the compliance limit in March and April 2021 and March 2022 (Teck 2022). For more information on the adaptive management framework, the Management Questions, the Key Uncertainties, the Response Framework, Continuous Improvement, linkages between the AMP and other EVWQP programs, and AMP reporting, refer to the AMP (Teck 2021a) and the 2021 Annual AMP report (Teck 2022b).

2 METHODS

2.1 Overview

The general approach for the EVO LAEMP includes a description of the collected data and data evaluation in relation to each of the study questions (Table 2.1). This report includes data up to the end of the 2022 calendar year for all endpoints. Historical data are also presented where appropriate.

Water quality and biological samples were collected from established monitoring areas in Erickson, Bodie, Gate, and Michel creeks (Figure 1.3; Tables 2.2 to 2.4). Biological monitoring areas are the same locations utilized as part of previous existing conditions evaluations to support the EVO SRF P2 (Minnow 2020a, 2021a) and the RAEMP (Minnow 2020b). Biological monitoring areas include those potentially influenced by the SRF, including areas upstream (RG_ERCKUT) and downstream (RG_ERCKDT, RG_ERCKMD, RG_ERCKUC and RG_ERCK) of the SRF intake/outfall structure in the non-fish bearing reach of Erickson Creek as well as above and below the sediment pond in Gate Creek (RG_GATE and RG_GATEDP, respectively) as well as upstream and downstream of the sedimentation pond in Bodie Creek (RG_BOCKRD and RG_BOCK, respectively). Four areas in Michel Creek were sampled, including directly upstream of Erickson Creek (RG_MI3), downstream of the Erickson Creek (RG_MIDER), Gate Creek (RG_MIDGA), and Bodie Creek (RG_MIDBO) confluences, and an area downstream of all EVO influence into Michel Creek (RG_MICOMP; EVO Compliance point). Two reference areas were included, one in Alexander Creek (RG_ALUSM), and another in upper Michel Creek (RG_MI25). Additional biological sampling occurred through 2022 to support the Investigation Into Enhanced Selenium Bioaccumulation in Benthic Invertebrate Tissue in Erickson Creek (Table 2.3; Teck 2023a). Although water samples are taken during sampling at each of these areas, biological monitoring areas are also paired with Teck routine water quality stations (when applicable) to provide additional temporal information regarding water quality.

To address the study questions described in Section 1.3, the 2022 EVO LAEMP included evaluation of the following components:

- Water temperature in Erickson Creek recorded continuously with data loggers;
- Concentration of total selenium and other constituents (i.e. those listed in Appendix A) in sediment;
- Calcite presence and concretion in receiving environment;

Table 2.1: Approach for the EVO LAEMP, 2021 to 2023

Study Questions	Water				Biological				
	Measurement Endpoint	Indicator Type	Areas ^a	Evaluation Criteria ^b	Measurement Endpoint	Indicator Type	Areas	Evaluation Criteria ^b	
<u>Study Question #1</u> : Has temperature changed in the receiving environment of Erickson Creek as the result of SRF water treatment?	Temperature	Indirect	RG_ERCKUT, RG_ERCKDT, EV_EC_FLOW3, EV_EC_FLOW2, EV_EC_FLOW1, RG_ERCK	(via data loggers)	Comparison to water quality guidelines and SPO criteria.	Direct	Benthic invertebrate community structure (abundance, richness, %EPT, %Ephemeroptera, %Chironomidae)	RG_ERCKUT, RG_ERCKDT, RG_ERCK	Comparison to results from past observations, reference areas, and reference normal ranges.
<u>Study Question #2</u> : Has calcite in the receiving environments (Erickson, Bodie, Gate, and Michel Creeks) been influenced by SRF water treatment and/or calcite prevention (e.g. antiscalant) efforts??	Calcite	Indirect	RG_ALUSM, RG_MI25, RG_ERCKUT, RG_ERCKDT, RG_ERCK, RG_GATE ^e , RG_BOCK ^e , RG_MI3, RG_MIDER, RG_MIDGA, RG_MIDBO, RG_MICOMP		Comparison to results for past observations, reference areas, and to future SPO criteria. Comparison between SRF downstream and upstream areas.	Direct	Benthic invertebrate community structure (abundance, richness, %EPT, %Ephemeroptera, %Chironomidae)	RG_ALUSM, RG_MI25, RG_ERCKUT, RG_ERCKDT, RG_ERCK, RG_GATE ^e , RG_BOCK ^e , RG_MI3, RG_MIDER, RG_MIDGA, RG_MIDBO, RG_MICOMP	Comparison to results from past observations, reference areas, and reference normal ranges.
<u>Study Question #3</u> : Has SRF water treatment and/or calcite prevention (e.g. antiscalant) (a) decreased aqueous concentrations of selenium and nitrate and/or (b) changed other mine-related constituents in effluent and receiving environments (Erickson, Bodie, Gate, and Michel Creeks)?	Water Quality	Indirect	RG_ALUSM, RG_MI25, RG_ERCKUT, RG_ERCKDT, RG_ERCK, RG_GATE, RG_GATEDP, RG_BOCK, RG_MI3, RG_MIDER, RG_MIDGA, RG_MIDBO, RG_MICOMP		Comparisons to results for past observations, reference areas, and to water quality guidelines and benchmarks. Comparison between SRF downstream and upstream areas.	Direct	Benthic invertebrate community structure (abundance, richness, %EPT, %Ephemeroptera, %Chironomidae)	RG_ALUSM, RG_MI25, RG_ERCKUT, RG_ERCKDT, RG_ERCK, RG_GATE ^e , RG_BOCK ^e , RG_MI3, RG_MIDER, RG_MIDGA, RG_MIDBO, RG_MICOMP	Comparison to results from past observations, reference areas, and reference normal ranges.
	Sediment Quality	Indirect	RG_ALUSM, RG_MI25, RG_ERCKUT, RG_ERCKDT, RG_MICOMP						
	Aqueous Toxicity ^c	Semi-direct	Acute: F2_BPO, EV_ECOUT, EV_EC1, EV_GT1, and EV_BC1 Chronic: EV_MC2	Comparison to reference areas and expectations based on aqueous concentrations of mine-related chemicals.					
<u>Study Question #4</u> : Have benthic invertebrate tissue selenium concentrations changed as a result of the SRF in Erickson, Bodie, Gate, and Michel Creeks?	Total and dissolved selenium concentrations	Indirect	RG_ALUSM, RG_MI25, RG_ERCKUT, RG_ERCKDT, RG_ERCK, RG_GATE, RG_GATEDP, RG_BOCK, RG_MI3, RG_MIDER, RG_MIDGA, RG_MIDBO, RG_MICOMP		Comparison to results for past observations and reference areas. Comparison between SRF downstream and upstream areas.	Indirect	Benthic invertebrate tissue selenium (composite taxa samples)	RG_ALUSM, RG_MI25, RG_ERCKUT, RG_ERCKMD ^f , RG_ERCKDT, RG_ERCK, RG_GATE, RG_GATEDP, RG_BOCK, RG_MI3, RG_MIDER, RG_MIDGA, RG_MIDBO, RG_MICOMP	Concentrations relative to effect benchmarks, past observations, and reference area results. Comparison to lotic bioaccumulation models.
	Selenium speciation	Indirect	RG_ALUSM, RG_MI25, RG_ERCKUT, RG_ERCKDT, RG_ERCK, RG_GATE, RG_GATEDP, RG_BOCK, RG_MI3, RG_MIDER, RG_MIDGA, RG_MIDBO, RG_MICOMP						
<u>Study Question #5</u> : Are there changes in the benthic invertebrate community in Erickson, Bodie, Gate, and Michel Creeks associated with SRF treatment (including calcite prevention)?	Temperature	Indirect	See Study Question #1		Benthic invertebrate community structure (abundance, richness, %EPT, %Ephemeroptera, %Chironomidae)	Direct	RG_ALUSM, RG_MI25, RG_ERCKUT, RG_ERCKDT, RG_ERCK, RG_GATE ^e , RG_BOCK ^e , RG_MI3, RG_MIDER, RG_MIDGA, RG_MIDBO, RG_MICOMP	Comparison to results from past observations, reference areas, and reference normal ranges.	
	Calcite	Indirect	See Study Question #2						
	Water Quality and Supporting Evidence ^d	Indirect	See Study Question #3						
<u>Study Question #6</u> : Is SRF water treatment affecting indicators of productivity (e.g. phosphorus) in the receiving environment?	Phosphorus and other nutrient concentrations	Indirect	RG_ALUSM, RG_MI25, RG_ERCKUT, RG_ERCKDT, RG_ERCK, RG_GATE, RG_GATEDP, RG_BOCK, RG_MI3, RG_MIDER, RG_MIDGA, RG_MIDBO, RG_MICOMP	Comparison to results from past observations, reference areas, and to available water quality guidelines.	Visual Periphyton Coverage	Direct	RG_ALUSM, RG_MI25, RG_ERCKUT, RG_ERCKDT, RG_ERCK, RG_GATE, RG_GATEDP, RG_BOCK, RG_MI3, RG_MIDER, RG_MIDGA, RG_MIDBO, RG_MICOMP	Comparison to results from past observations	
					Benthic invertebrate density, biomass, and community	Direct	RG_ERCKUT, RG_ERCKDT	Comparison to results from past observations and reference areas.	
					Benthic invertebrate community structure (abundance, richness, %EPT, %Ephemeroptera, %Chironomidae)	Direct	RG_ALUSM, RG_MI25, RG_ERCKUT, RG_ERCKDT, RG_ERCK, RG_GATE ^e , RG_BOCK ^e , RG_MI3, RG_MIDER, RG_MIDGA, RG_MIDBO, RG_MICOMP	Comparison to results from past observations, reference areas, and reference normal ranges.	

Notes: SPO = Site Performance Objective. EPT = Ephemeroptera, Plecoptera, and Trichoptera. SRF = Saturated Rock Fill.

^a Areas listed under 'Water' include only those taken for the purposes of the EVO LAEMP (i.e. sampling conducted concurrently with biological sampling). Additional information regarding Teck's routine water quality monitoring is shown in Table 2.4.

^b Comparison to past observations refers to comparison of results during SRF operation to results prior to SRF operation.

^c Aqueous acute and chronic toxicity are evaluated as part of permit 107517 through the Annual Water Quality Monitoring Program and Annual Chronic Toxicity Testing Program, respectively. Results from these studies are used to support the water quality results collected for the EVO LAEMP.

^d Supporting evidence includes sediment quality and aqueous acute and chronic toxicity.

^e Benthic invertebrate community structure and calcite were not evaluated at RG_GATE or RG_BODIE in 2021 as suitable riffle habitat was not identified, which is consistent with CABIN protocols.

^f RG_ERCKMD was added in December 2021 to add spatial resolution to selenium concentrations in benthic invertebrate tissue in Erickson Creek.

Notes: (✓) = target sample size met, "-" = no sampling expected, BIC = Benthic Invertebrate Composite-Taxa, LAEMP = local aquatic environmental monitoring program, TBD = to be determined (new sampling). Target sample size is shown. RG_ERCKMD was added in December 2021 for additional spatial resolution of benthic invertebrate tissue selenium concentrations in Erickson Creek.

^a Water sampling does not include sampling conducted by Teck.

^b In the initial study design, calcite index was to be evaluated once at each area. To be consistent with CABIN protocols (and other LAEMP projects and the RAEMP), calcite was evaluated at each riffle that kick sampling (community)

^c Benthic invertebrate tissue and selenium speciation sampling at RG_GATEDP and RG_BOCK also occurred in August 2022 as part of the Selenium Speciation program.

^d RG_GATE and RG_BOCK were not evaluated using kick and sweep sampling for benthic invertebrate community monitoring or calcite index as the sampling reach did not have a "well-established riffle or straight run" present (which is a requirement for CABIN sampling [Environment Canada 2012a]).

^e Sediment sampling was conducted as part of the RAEMP at RG_ERCK, RG_MI3, and RG_MIDER.

^f Visual periphyton monitoring is part of the CABIN protocol and thus only expected to occur if benthic invertebrate community evaluations and other CABIN protocols are conducted. Although CABIN protocols did not occur at RG_GATE, RG_GATEDP, and RG_BOCK, periphyton visual scores were still utilized. In the study design, RG_BOCK was to be evaluated at five areas, but to the limited habitat and area of study only one visual inspection was conducted.

Notes: "-" = sampling will not be completed at this area, UTM = Universal Transverse Mercator, EVO = Elkview Operations, SRF = Saturated Rock Fill, C = Continuous Monitoring (Temperature Only), D = daily, M = monthly, W = weekly, W/M = weekly during freshet (March 15 to July 15), monthly otherwise, Q = quarterly, S = September (once), SA = semi-annual. Sampling frequency is currently managed through the permit.

^a Dissolved oxygen, water temperature, specific conductance, pH.

^b Parameters consistent with Permit 107517 (see Table 2.5 for details).

^c Aqueous acute and chronic toxicity are evaluated as part of permit 107517 through the Annual Water Quality Monitoring Program and Annual Chronic Toxicity Testing Program, respectively. Results from these studies are used to support the water quality results collected for the EVO LAEMP.

^d Q = Quarterly 96-hr rainbow trout LT₅₀; 48-hr *Daphnia* spp. LT₅₀.

^e Q = Quarterly 7-day *C. dubia* growth and survival, 72-hr *P. subcapitata* growth tests; SA = Semi-annual 28-day *H. azteca* growth and survival tests in spring and fall, 30-day early life stage rainbow trout tests in spring and fall, 30-day early life stage fathead minnow tests in summer and winter.

^f Routine water quality from Erickson Creek Intake (i.e. Influent) will be paired with the biological sampling area, RG_ERCKUT.

^g RG_ERCKMD was added in December 2022 to add additional spatial resolution to selenium concentrations in benthic invertebrate tissue in Erickson Creek.

^h The location of the Teck Compliance station, EV_MC3, is different than the biological sampling area (RG_MI3). The UTM for EV_MC3 are 659833E and 5505234N.

ⁱ Monthly sampling at EV_MC3a was added to the EVO LAEMP study design on March 4, 2022 and will be paired with RG_MIDER.

^j The location of the Teck Compliance station, EV_MC2, is different than the biological sampling area (RG_MICOMP). The UTM for EV_MC2 are 655871E and 5508994N.

- Concentrations of nutrients, total selenium, selenium species, and other constituents (i.e. those listed in Appendix A) in water, based on concurrent and routine water quality monitoring;
- Acute toxicity of SRF buffer pond outlet effluent (F2_BPO) and four surface water locations from Erickson Creek (EV_ECOUT [RG_ERCKDT] and EV_EC1 [RG_ERCK]), Bodie Creek (EV_BC1 [RG_BOCK]), and Gate Creek (EV_GT1 [RG_GATEDP]), as well as chronic toxicity of surface water from the compliance point EV_MC2 (RG_MICOMP);
- Periphyton visual coverage scores; and
- Benthic invertebrate density, biomass, community, and composite-taxa tissue selenium concentrations.

Water quality monitoring and acute and chronic water toxicity testing results presented in this report include requirements specified under Permit 107517. Biological sampling in 2022 was completed in September in accordance with the 2021 to 2023 EVO LAEMP study design (Minnow 2021b), with additional sampling occurring monthly from March to December 2022 (Table 2.3).

The methods associated with sample collection, laboratory analysis, and data analyses are described in the following sections and in Appendix A.

2.2 Physical Habitat and Supporting Measures

2.2.1 Temperature

2.2.1.1 Sampling Overview

To evaluate potential temperature-related effects associated with the SRF discharge, instream continuous data loggers (TidbiT v2 Temp [UtBI-001]) were deployed at six locations (RG_ERCKUT, RG_ERCKDT, EV_EC_FLOW3, EV_EC_FLOW2, EV_EC_FLOW1, and RG_ERCK) in Erickson Creek in December 2020 (Figure 1.4; Table 2.4). Temperature data from these loggers was downloaded three times in 2022 (April, June, and October/November).

2.2.1.2 Data Analysis

Temperature data is reviewed for anomalies prior to analysis. Temperature data from Teck routine water monitoring in fish-bearing areas of Erickson Creek (EV_EC1 [RG_ERCK]), were evaluated relative to British Columbia water quality guidelines. Maximum daily temperature from temperature loggers at EV_EC1 (RG_ERCK) were compared directly to the SPO (which is based largely on the optimum temperatures for fish noted above) per Permit 107517.

2.2.2 Sediment Quality

2.2.2.1 Sampling Overview

Sediment quality samples were collected concurrently with benthic invertebrate sampling in September 2022 using procedures consistent with those outlined in the British Columbia Field Sampling Manual (BCMOECCS 2020a). Three replicate sediment samples from both reference areas (RG_ALUSM and RG_MI25) were collected, while five replicate sediment samples were collected immediately upstream (RG_ERCKUT) and downstream of the SRF outfall (RG_ERCKDT) in Erickson Creek as well as at the compliance point in Michel Creek (RG_MICOMP; Figure 1.3; Table 2.2). Sediment samples were also collected at RG_MI3 (n=4), RG_ERCK (n=5), and RG_MIDER (n=5) as part of the 2021 to 2023 RAEMP study design (Minnow 2021c). Additional samples were collected monthly in Erickson Creek from March to December 2022, when sediment was present (Table 2.3).

2.2.2.2 Laboratory and Data Analysis

Sediment samples were analyzed by ALS Environmental in Calgary, Alberta, and analyses included physical and chemical parameters (e.g., moisture content, particle size, total organic carbon [TOC], metals and metalloids, and polyaromatic hydrocarbons [PAHs]). Analyses of sediment quality data were completed using the following approaches (see Appendix B sections B3.1.2 and B3.1.3 for detailed methodology):

- Tabular and graphical comparison to British Columbia Sediment Quality Guidelines (WSQGs), except for selenium concentrations which were compared to an alert concentration considered equivalent to an upper WSQG. The sediment data were also compared to regional normal ranges.
- Graphical spatial comparisons of chemical parameters;
- Assessment of sediment quality upstream and downstream of SRF outfall as well as in the Michel using a two-way ANOVA;

2.2.3 Calcite and CABIN Measures

2.2.3.1 Sampling Overview

Consistent with the requirements of the Canadian Aquatic Biomonitoring Network (CABIN) sampling protocol, supporting habitat information (e.g., water velocity and depth, *in situ* water quality [temperature, dissolved oxygen, specific conductivity, pH], canopy cover, and substrate characteristics [100 pebble count]) was documented concurrent with benthic

invertebrate community samples (Environment Canada 2012a)⁸. Visual scores of periphyton coverage were recorded in accordance with the CABIN method (and are discussed in greater detail in Section 2.4). In addition to the CABIN requirements, measurements of calcite presence and concretion were conducted on 100 particles (pebbles) at each biological sampling location concurrent with (and using the same particles as) the 100-pebble count.

2.3 Water Quality and Toxicity

2.3.1 Water Quality

2.3.1.1 Sampling Overview

Water quality and selenium speciation samples, as well as *in situ* water quality data (i.e., temperature, flow, pH, conductivity, and DO), were collected concurrently with all biological sampling (Tables 2.2 to 2.4). In addition, routine water quality monitoring data collected by Teck and that corresponded with many biological sampling areas were included in the EVO LAEMP (Table 2.4). Water quality samples were collected to understand potential changes to concentrations of nutrients and mine-related constituents in accordance with Permit 107517, while selenium speciation samples were collected to provide understanding of speciation in the study area, and to compare to benthic invertebrate tissue selenium concentrations. Sample collection procedures were consistent with those outlined in the British Columbia Field Sampling Manual (BCMOE 2013; see Appendix A2.1 for detailed methodology).

2.3.1.2 Laboratory and Data Analysis

Water quality samples were analyzed by ALS Environmental in Calgary, AB for the constituents listed in Permit 107517 except for selenium species (Table 2.5). Analysis of selenium species was performed by Brooks Applied Labs in Seattle, WA. Methods used were consistent with the British Columbia Environmental Laboratory Manual (BCMOECCS 2020b) where applicable (See Appendix A for detailed methodology). Upon completion of the laboratory analyses, data reports were provided to Minnow and Teck electronically as Adobe Acrobat PDF (Appendix H) and Microsoft Excel files and data were uploaded to Teck's EQUIS database.

Water quality data collected routinely (by Teck) and concurrently with biological sampling were stored in Teck's EQUIS™ database, and relevant data was downloaded from the database in

⁸ As benthic invertebrate community sampling was not conducted at RG_GATE and RG_BOCK (as discussed in more detail in Section 2.5.4 and Section 7.6), the 100-pebble count was also not conducted. As such calcite for these areas is based on information provided by the 2021 Regional Calcite Monitoring Program (Robinson et al. 2022).

Table 2.5: Temperature Loggers in Erickson Creek, 2022

Logger Number	Area	UTM	
		Easting	Northing
20745495	EV_EC_FLOW1	660502	5505446
21199587	EV_EC_FLOW1	660502	5505446
20745435	EV_EC_FLOW2	660662	5505759
20745441	EV_EC_FLOW2	660662	5505759
20745436	EV_EC_FLOW3	660809	5506052
20745470	EV_EC_FLOW3	660809	5506052
20745465	RG_ERCK	659866	5505129
21087183	RG_ERCK	659845	5505120
21418920	RG_ERCK	659855	5505127
20745473	RG_ERCKDT	660851	5506333
20745485	RG_ERCKDT	660855	5506330
20745439	RG_ERCKUT	660794	5506508
20745479	RG_ERCKUT	660794	5506509
21087191	RG_ERCKUT	660817	5506482

Excel format for analysis. Analyses of water quality data were completed using the following approaches (see Appendix A for detailed methodology):

- Tabular and graphical comparison to applicable benchmarks, SPOs, interim screening values, and BCWQGs (Appendix Table A.1);
- Graphical spatial comparisons of order constituents (nitrate, total selenium, dissolved cadmium, and sulphate), TDS, total and dissolved nickel, and selenium species
- Evaluation of temporal trends in monthly mean water quality concentrations using a Two-way censored regression analysis of variance (2-way ANOVA).
- Evaluation of concentrations between the station immediately upstream (RG_ERCKUT) and immediately downstream (RG_ERCKDT) using a Two-way censored regression analysis of variance (2-way ANOVA).

Quality assurance and control results (e.g. field blanks, duplicate samples, etc.) associated with water samples collected concurrently with biological samples are discussed in greater detail in the DQR in Appendix B (see Appendix H for applicable laboratory reports).

2.3.2 Acute Toxicity

Acute toxicity tests were conducted on a quarterly basis at five stations within in the EVO LAEMP study area as discussed in the Annual Water Quality Report (Table 2.4; Teck 2022b):

- Downstream of outfall in Erickson Creek (EV_ECOU);
- Erickson Creek at confluence of Michel Creek (EV_EC1);
- Gate Creek discharge monitoring location (EV_GT1); and
- Bodie Creek discharge monitoring location (EV_BC1).

Acute toxicity consisted of two bioassays as per Permit 107517:

- Single concentration acute toxicity test (96-hour LT_{50}) using rainbow trout (*Oncorhynchus mykiss*); universal method: EPS 1/RM/9 (Environment Canada 2007a); and
- Single concentration acute toxicity test (48-hour LT_{50}) using *Daphnia* spp.; universal method: EPS 1/RM/11 (Environment Canada 1996).

2.3.3 Chronic Toxicity

Chronic toxicity testing was conducted by Nautilus Environmental for the annual Regional Chronic Toxicity Study as required by Permit 107517 (WSP 2023). The quarterly and semi-annual tests were conducted using *Pseudokirchneriella subcapitata*, *Ceriodaphnia dubia*, *Hyalella azteca*, *Oncorhynchus mykiss*, and *Pimephales promelas* (detailed methodology can be found in Appendix A2.4).

2.4 Periphyton

2.4.1 Sampling Overview

Periphyton sampling for the purpose of assessing productivity involved visual scoring as specified in the CABIN method for benthic invertebrate sampling (Environment Canada 2012a). Although only a single score is required per area under the CABIN protocol, scores were recorded for five stations (a minimum of 5 metres apart) in each biological monitoring area as part of the EVO LAEMP, except for RG_BOCK and RG_GATEDP which had limited sampling area and thus only one score for the area was recorded (detailed methodology can be found in Appendix A3.2.3).

2.4.2 Data Analysis

Periphyton coverage was evaluated spatially and temporally in conjunction with other measures of productivity, including temporal/spatial trends of phosphorus and other nutrients (Section 3.6.1), as well as measurements of density and biomass of benthic invertebrates upstream and downstream of the SRF intake/outfall structure in Erickson Creek (Section 3.6.2) to better understand the influence of the SRF on productivity. Tabulated periphyton scores was performed in Microsoft Excel.

2.5 Benthic Invertebrates

Benthic invertebrate samples were collected to address study questions related to benthic invertebrate tissue (BIT) selenium bioaccumulation (Section 3.4), productivity (as determined via Hess sampling; Section 3.6.2), and community structure (as determined via CABIN sampling; Section 3.5). Consistent with other LAEMPs and the RAEMP (Minnow 2021c,d, Minnow and Lotic 2021), benthic invertebrate sampling was completed in Biweekly or monthly from March to December of 2022. As noted in Section 2.3.1, individual water samples for routine water quality analysis and selenium speciation analysis were collected from each monitoring area during the sampling event, concurrently with the collection of biological samples.

2.5.1 CABIN Sampling (Community)

2.5.1.1 Sampling Overview

Benthic invertebrate samples were collected using a kick and sweep method to allow evaluation of community structure. Three replicate samples were collected from each reference area (RG_ALUSM and RG_MI25) and each mine-exposed area (Table 2.2), with the exception of RG_MICOMP where five replicate samples were collected to support the RAEMP study design requirements (Minnow 2021c). As noted in the 2021 to 2023 EVO Study Design (Minnow 2021b), one sample was taken from RG_ERCK (replication not possible due to the presence of a single riffle habitat).

Benthic invertebrate community sampling followed the CABIN protocol, which involved a 3-minute travelling kick into a net with a triangular aperture measuring 36 cm per side and a mesh having 400- μ m openings (Environment Canada 2012a). Supporting measures, including habitat characterization, were also collected concurrent with sampling. For detailed methodology, see Appendix A).

2.5.1.2 Laboratory and Data Analysis

Benthic invertebrate community samples were analyzed by Cordillera Consulting (lead taxonomist Scott Finlayson), in Summerland BC, for sorting and taxonomic identification.

Total organism abundance was reported for every distinct taxon identified in each sample. Benthic invertebrate community structure was evaluated based on total abundance, taxonomic richness (to the lowest practicable level of taxonomy), and the abundances and proportional abundances (%) of major taxonomic groups. Analyses of benthic invertebrate community data were completed using the following approaches (see Appendix A for detailed methodology):

- Graphical comparison of data relative to regional and site-specific normal ranges ;
- Evaluation of temporal changes in endpoints from mine-exposed and reference areas using a two-way ANOVA;

2.5.2 Hess Sampling (Density, Biomass, and Community)

2.5.2.1 Sample Overview

Benthic invertebrate community samples were collected using a Hess sampler with 500 µm mesh, which allowed for evaluation of density, biomass, and community structure of the area sampled. Ten single-Hess samples were collected at each of two mine-exposed areas, one immediately upstream (RG_ERCKUT) and one downstream of the SRF outfall (RG_ERCKDT), with the replicate sampling locations a minimum of 5 m apart (Figure 1.3; Table 2.2).

2.5.2.2 Laboratory and Data Analysis

Benthic invertebrate biomass and density samples were sent to Zeas Inc. (lead taxonomist Danuta Zaranko), in Nobleton ON, for sorting and taxonomic identification. Analyses of benthic invertebrate productivity data were completed using the following approaches (see Appendix A sections for detailed methodology):

- Graphical comparison of benthic invertebrate biomass and density changes temporally and spatially.
- A two-way ANOVA comparison between areas upstream (RG_ERCKUT) and downstream (RG_ERCKDT) of SRF water treatment.

2.5.3 Tissue Selenium

2.5.3.1 Sampling Overview

Benthic invertebrate tissue (BIT) samples for selenium analysis were collected using the kick and sweep sampling method (which is described in greater detail in Appendix A), except that sampling was not timed and kicking continued only until sufficient organisms were collected. All sampling events included collection of a composite sample representative of the benthic

invertebrate community at the monitoring area (composite-taxa samples; see Appendix A3.4.1 for detailed methodology).

2.5.3.2 Laboratory and Data Analysis

Benthic invertebrate tissue samples were kept in a freezer until they were transported by courier in coolers with ice packs to TrichAnalytics Inc. in Saanichton, BC. Samples were dehydrated (<60°C) upon receipt by the laboratory and analyzed using Laser Ablation Inductively Coupled Plasma Mass Spectrometry (ICP-MS). Quality assurance/quality control measures associated with the tissue chemistry analyses included evaluation of laboratory duplicates and certified reference materials, discussed in greater detail in the Data Quality Review (DQR) in Appendix B (see Appendix H for applicable laboratory reports). Results are reported on a dry weight basis along with moisture content.

Analyses of composite-taxa BIT selenium data were completed using the following approaches (see Appendix A for detailed methodology):

- Graphical comparison of tissue selenium concentrations relative to applicable benchmarks (Appendix Table A.2) and the regional reference normal range;
- Evaluation of spatial differences among areas in tissue selenium concentrations for each sampling event in 2022, using a one-way ANOVA.
- Evaluation of the potential effects of SRF operational phases on tissue selenium concentrations from mine-exposed areas relative to upstream and reference areas using a two way ANOVA;
- Comparison of observed tissue selenium concentrations to those predicted using selenium bioaccumulation tool.

3 RESULTS AND DISCUSSION

3.1 Study Question #1

Study question # 1 (Has temperature changed in the receiving environment of Erickson Creek as the result of SRF water treatment?) was evaluated using continuous temperature data loggers installed at RG_ERCKUT, RG_ERCKDT (EV_ECOUT), EV_EC_FLOW1, EV_EC_FLOW2, EV_EC_FLOW3, and RG_ERCK (EV_EC1).

3.1.1 Temperature

Temperature in upper Erickson Creek (RG_ERCKUT, RG_ERCKDT (EV_ECOUT), EV_EC_FLOW1, EV_EC_FLOW2, and EV_EC_FLOW3) is heavily influenced by groundwater and is consistently between 5 and 6°C year-round in the absence of SRF discharge. Although the SRF does not utilize heating or cooling, the effluent (or treated water) being discharged from the effluent retention pond is expected to be influenced by seasonal fluctuations in air temperatures both in the pond and the pipeline when compared to water upstream (Golder 2020c, Teck 2020a). As such, water temperatures measured by continuous data loggers in Erickson Creek upstream of the SRF outfall (RG_ERCKUT), were consistent throughout 2022 at approximately 5°C, similar to 2021 (Figure 3.1). Water temperatures downstream of the SRF (RG_ERCKDT); however, fluctuated concurrently with SRF operational period. During SRF operation (i.e., January to April and October to the end of the year), mean daily temperatures at RG_ERCKDT were slightly higher than RG_ERCKUT (~0.5 °C) and more variable. Variability in temperature can be attributed to several factors including but not limited to changes in the proportional volume of treated water entering Erickson Creek and changes in the thermal regime in the effluent retention pond (e.g., seasonal and daily changes in sunlight, ambient air temperature, and residence time). Patterns in water temperature were similar to RG_ERCKDT further downstream at EV_EC_FLOW3, EV_EC_FLOW2, EV_EC_FLOW1 during SRF operation, and during shutdown (April to October) water temperatures at all stations in Erickson Creek (except RG_ERCK) were between 5°C and 6°C. Temperatures at RG_ERCK (EV_EC1) showed more seasonality (irrespective to SRF operational status) compared to RG_ERCKDT with minimum temperatures recorded in the winter months typically ranging from 1 to 6 °C and maximum temperatures in the summer reaching a maximum daily average of 8.6°C (observed in July; Appendix Table C.1). On several occasions, temperatures at EV_EC1 (RG_ERCK) were higher than upstream areas, likely due to the lack of canopy cover and shallower water in that area; however, water temperature did not exceed of the Permit 107517 limit at EV_EC1 in 2022 (7°C January 1 to April 30 and November 1 to December 31, 13°C May 1 to August 31, and 10°C September 1 to October 31).

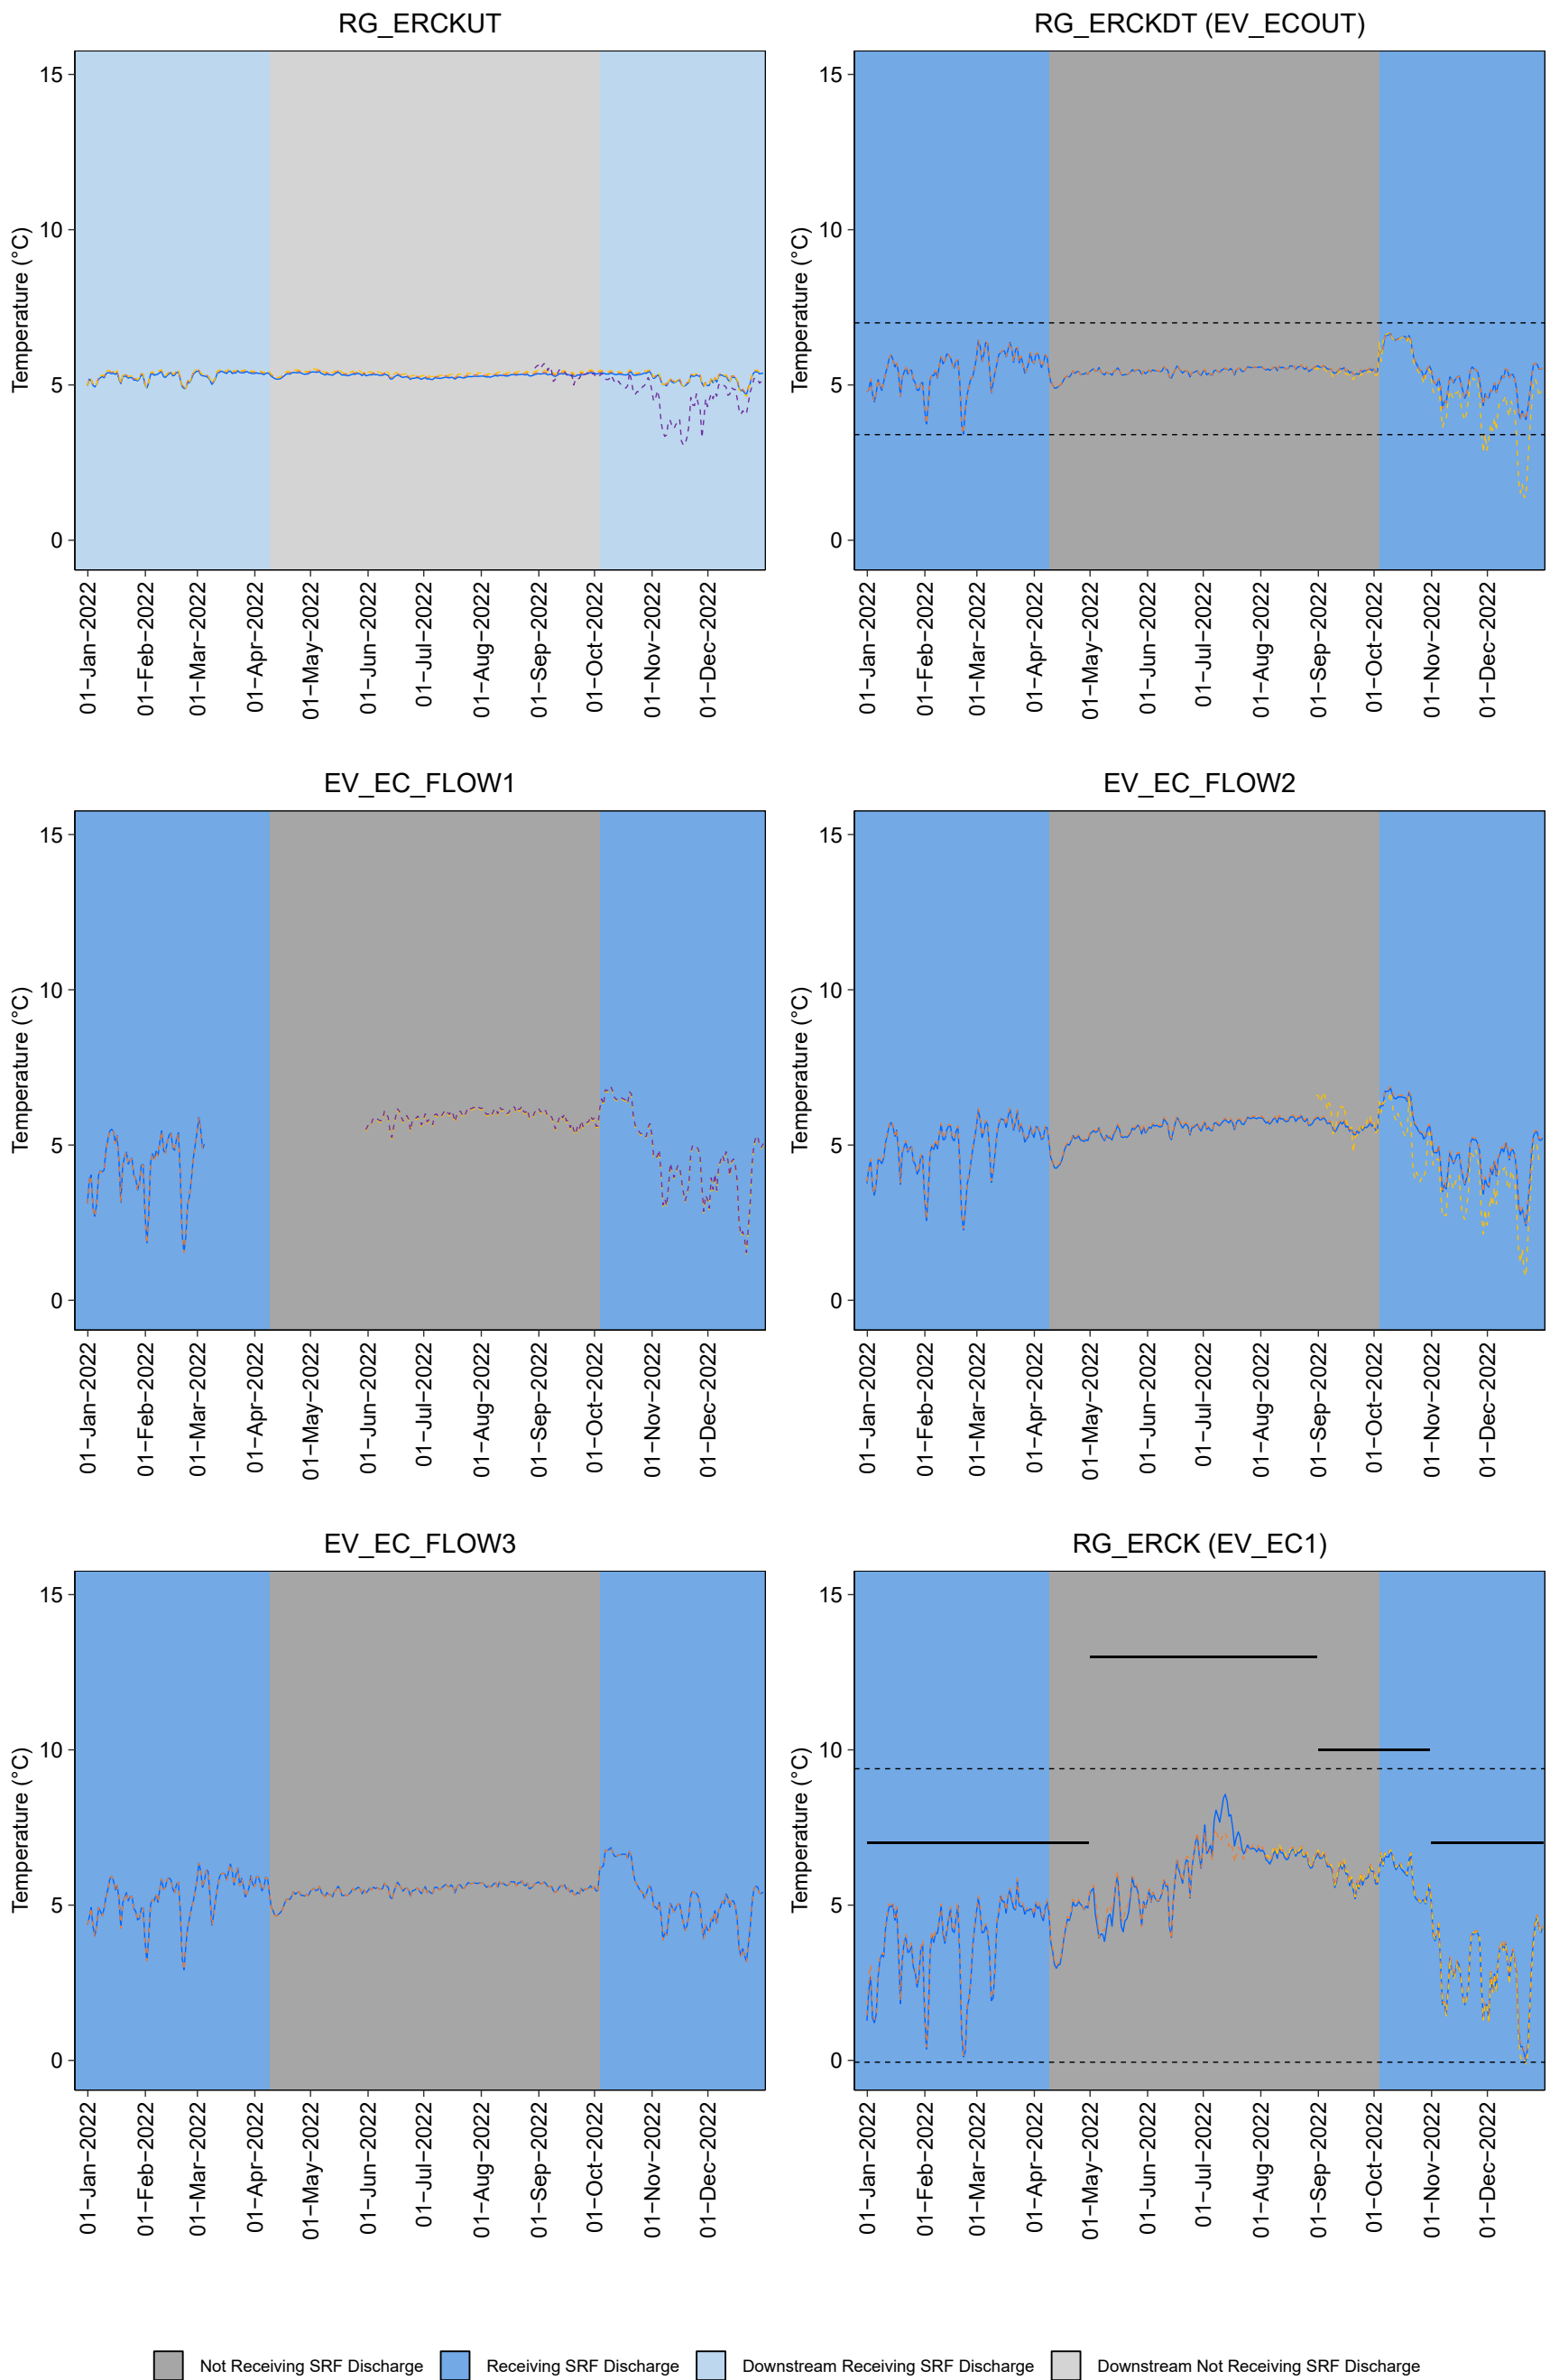

Figure 3.1: Mean Daily Water Temperature Recorded by Temperature Loggers, EVO LAEMP, 2022

Note: Solid black horizontal lines indicate the maximum daily temperature as specified in Permit 107517, which came into effect August 13, 2021. Dashed horizontal lines indicate the minimum and maximum average hourly temperature from 2018 to 2020. Different colours indicate replicate loggers.

Temperature at RG_ERCKDT and RG_ERCK were within the minimum and maximum average hourly temperature from 2018 to 2020 (prior to SRF operation) throughout 2022, with the exception of one logger at RG_ERCKDT (EV_ECOUT) which recorded cooler temperatures. The cooler temperatures recorded on the single logger could be due to the placement of the logger, this logger was installed in a slower moving pool which may be more susceptible to daily changes in air temperature. In 2021, temperatures were only greater than pre-SRF temperatures in the summer months at these stations, while in 2022 the SRF was not discharging during this time and thus remained similar to pre-SRF temperatures.

Temperature measurements at stations in fish-bearing areas of Erickson were also compared to British Columbia guidelines⁹, which are defined as a maximum $\pm 1^{\circ}$ C change from the optimum temperature range for spawning, incubation, and alevin / rearing temperature guidelines for both WCT and bull trout (BCMOE 2001). Temperatures in Erickson Creek (EV_EC1 [RG_ERCK]) remained within or below the optimum temperature ranges specified for both species, throughout the year (Appendix Table C.1).

In summary, water temperature in Erickson Creek downstream of the SRF (RG_ERCKDT, EV_EC_FLOW1, EV_EC_FLOW2, and EV_EC_FLOW3) was influenced by SRF operation in 2022; however, the magnitude of effects were both lower (compared to 2021) and temporally constrained due to SRF shutdown during the summer months when the SRF had the greatest influence on water temperature in 2021 (Minnow 2022). Considering there were no observed changes in biological endpoints (i.e., BIC and productivity) that could be linked to the variability in the water temperature and water temperatures did not exceed permit or BCWQG downstream of the SRF it is unlikely that this variability was ecologically significant in 2022.

3.2 Study Question #2

Study Questions #2 (Has calcite in the receiving environment (Erickson, Bodie, Gate, and Michel creeks) been influenced by SRF water treatment and/or calcite prevention (e.g. antiscalant) efforts?) was evaluated using calcite presence data collected through both the EVO LAEMP CABIN sampling as well as the Regional Calcite Program.

3.2.1 Calcite

Calcite accumulation has the potential to negatively affect aquatic habitat through changes to stream substrate characteristics (Minnow 2016; Hocking et al. 2020). Calcite concretion can adversely affect aquatic organisms via reduced suitability of habitat for fish spawning, egg incubation, and overwintering, or via potential effects to benthic invertebrates, and benthic

⁹ As noted in Section 1.2, upper portions of Erickson Creek and both Bodie and Gate Creek have been confirmed to be non-fish bearing.

invertebrate productivity that provides an important prey source for adult and juvenile fish (Robinson 2010; Barrett et al. 2016; Wright et al. 2018; Hocking et al. 2020; Minnow 2022). As many of the biological monitoring areas assessed in the EVO LAEMP are above fish barriers (Gate Creek, Bodie Creek, and upper portions of Erickson Creek), the potential effects of calcite on fish are limited to lower portions of Erickson (specifically RG_ERCK) and in Michel Creek. Regardless, direct effects of calcite on substrate and habitat and the impacts on benthic invertebrate community composition throughout the EVO LAEMP study area were considered.

Benthic invertebrate sampling targeted riffle habitat during September sampling and included calcite measurements (Figure 3.2; Appendix Table C.2). Both CI' and CI were reported for all areas in 2022; however, comparisons to previous years were completed using CI values. Mean CI values in 2022 for both reference areas (RG_ALUSM [CI' = 0.27 and CI = 0.68] and RG_MI25 [CI' = 0.05 and CI = 0.28]) were similar to previous years (2015 to 2021; Figure 3.3; Appendix Table C.2). While the reference areas showed consistent CI temporal patterns, mean CI values at RG_ERCKUT (upstream of the SRF outfall) has been variable over time, ranging from 1.42 (2020) to 0.20 (2021). At RG_ERCKDT (downstream of the SRF outfall), a similar pattern as upstream was observed, with lowest CI values recorded in 2021 (CI = 0.66) and the highest value recorded in 2020 (CI = 1.67). Both upstream and downstream of the SRF outfall (and the antiscalant addition), CI values in 2022 increased relative to 2021 but were lower than 2019 and 2020 (Table 3.1). Calcite trends in Erickson Creek are potentially confounded by the temporary suspension of SRF and calcite treatment in 2022; however, in 2021, CI values were consistently lower than previous years across many areas including upstream and downstream of the SRF outflow, this pattern is therefore likely not connected to antiscalant treatment in Erickson Creek and is more likely regional variation or sampler variation¹⁰. Calcite concretion (Cc) at both RG_ERCKUT (mean Cc = 0.07) and RG_ERCKDT (mean Cc = 0.13) was similar to Cc values recorded in 2021, lower than pre-antiscalant treatment values (2020 and 2022), and below the future SPO (December 31, 2024: Cc ≤ 0.5; ENV 2023).

Lower Erickson Creek at the mouth of Michel Creek (RG_ERCK), had a CI value of 2.47 in 2022, which was slightly higher than previous years (2018 to 2021; ranging from 1.58 to 2.20). Calcite concretion at RG_ERCK in 2022 was higher than previous years (Cc = 1.49) and currently greater than the future SPO (ENV 2023). Lower Erickson Creek (Reach 1, 290 m, stretching from the confluence of the Michel Creek to above RG_ERCK) is slated for calcite remediation and the lower 50 to 70 m will be remediated in September of 2023.

¹⁰ Minnow will continue to attend the annual calcite workshop (as part of the regional calcite program) to reduce sampler variation

Figure 3.2: Calcite Proportion and Concretion Scores for EVO LAEMP Areas, 2022

Notes: Calcite data from reference stations in green and mine-exposed stations in blue. Calcite Presence was measured using both a presence/absence (binary) and proportional method. The horizontal purple line represents the future SPO (i.e. by December 31st, 2024 Calcite Concretion Score = 0.5). Dashed vertical line separates reference from mine-exposed areas.

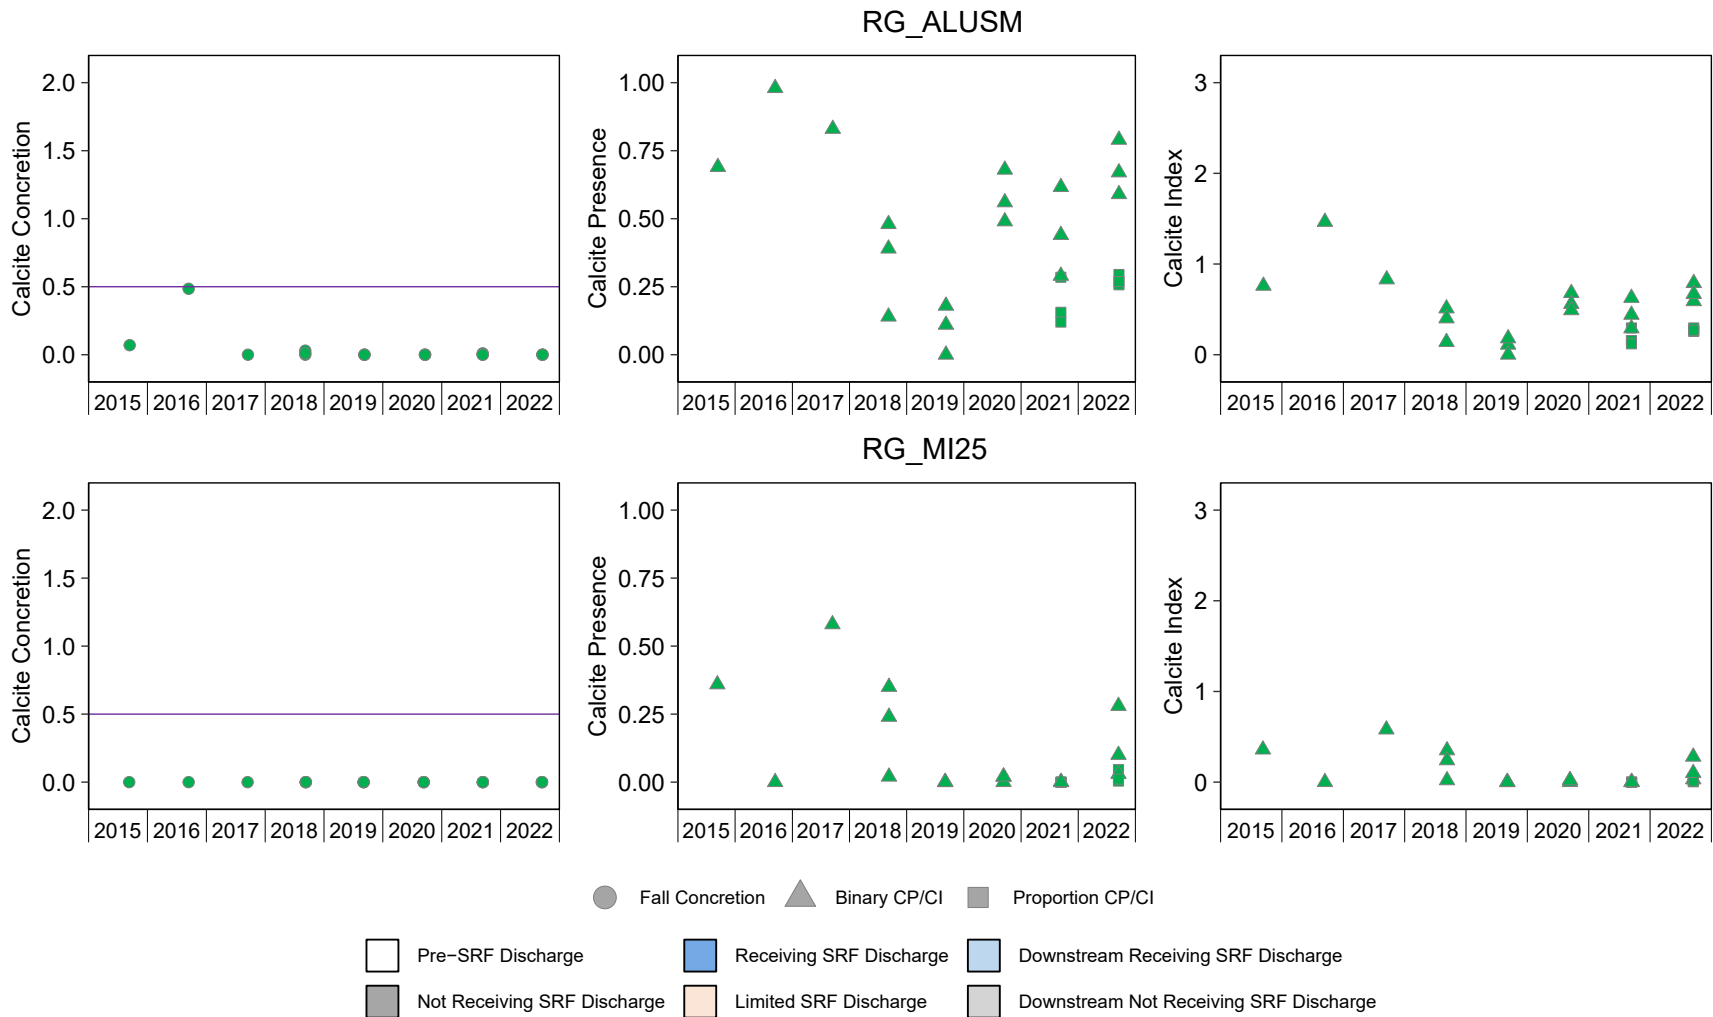

Figure 3.3: Calcite Proportion and Concretion Scores for EVO LAEMP Areas, 2015 to 2022

Notes: Calcite data from reference stations in green and mine-exposed stations in blue. Calcite data were collected in the fall (August to September). In 2021 and 2022 calcite Presence was measured using both a presence/absence (binary) and proportional method. The horizontal purple line represents the future SPO (i.e. by December 31st, 2024 Calcite Concretion Score = 0.5)

Notes: "-" = no calcite monitoring was completed. "Cp" = calcite presence score using a binary assessment method. "Cp'" = calcite presence score based on the percent of the particle surface area covered by calcite as a decimal to the nearest 10th percentile (0.1, 0.2, 0.3, etc.). "CI" = calcite index calculated using the binary calcite presence. "CI'" = calcite index calculated using the proportional calcite presence. Calcite indexes from the Regional Calcite Monitoring Program have not been provided.

In Gate Creek (RG_GATE) in 2022, calcite values were lower than recorded in previous years (2022 CI = 1.75), in contrast, calcite values in Bodie Creek (RG_BOCK) were higher in 2022 (CI = 2.71) compared to previous years (Figure 3.3). Calcite concentration at both Gate and Bodie creeks was above the future SPO in 2022 (Cc = 0.71 and 1.72). Both Gate and Bodie creeks have received treated effluent from the EVO SRF P2 from early-2022 on, which includes the addition of antiscalant.

Calcite index values collected with benthic invertebrate community samples at each of the Erickson Creek biological monitoring areas and Gate and Bodie creeks in 2022 were lower than those reported in the 2022 Regional Calcite Monitoring Program (which were evaluated between August and October; Smit and Robinson 2023). The cause of the difference could be due to the different spatial extents between the programs as well as the high presence of bryophytes in Erickson Creek (which is a unique habitat characteristic in the Elk Valley) which makes assessment of calcite difficult (see supporting CABIN measurements and methods for further details Appendix A3.2.1 and A 3.2.3). The mean 2022 CI score for the Erickson Creek area upstream of the SRF outfall was 1.54, while CI downstream the outfall and further downstream in Erickson Creek ranged from 2.89 to 2.94. Results from the 2022 Regional Calcite Monitoring Program report suggest that pre-EVO SRF P2 calcite presence and concretion in the Erickson Creek areas upstream (CI values: 1.68 to 1.73) and downstream of the outfall (CI values: 2.46 to 2.96) were largely lower than post-EVO SRF P2 operation upstream (CI values: 1.42 to 1.54) and similar to downstream of the outfall (CI values: 2.89 to 2.94). In 2022, the mean CI in Bodie Creek (1.43 [below the settling pond] and 2.83 [above the settling pond]) and Gate Creek (1.38 [above the settling pond]) were similar to or slightly higher than observations from previous years (Smit and Robinson 2023). Data from Gate and Bodie creeks are inconclusive when considering the effectiveness of antiscalant. In Gate Creek CI values have been decreasing since the start of treatment (2021); however, treated (GATE-25), and untreated (GATE-50 and GATE-75) areas have been decreasing at a similar rate. Areas in Bodie as well as Erickson Creek [including the above the SRF outfall] currently have Cc scores that are greater than the future SPO (December 31, 2024: Cc ≤ 0.5).

Immediately downstream of SRF influenced tributaries (Erickson, Gate, and Bodie creek) in Michel Creek (RG_MIDER, RG_MIDGA, and RG_MIDBO) and the area above the confluence of Erickson Creek (RG_MI3) had no reportable calcite presence or concretion in 2022 (resulting in a CI of 0; Figure 3.2; Appendix Table C.2) and were overall similar to (2021) or lower than (2018 to 2020) results from previous years (Figure 3.3). Calcite index values recorded at RG_MICOMP were elevated in 2022 compared to 2021 but similar to values recorded between 2018 and 2020. Similarly low CI values in Michel Creek study areas were reported in the 2022

Regional Calcite Monitoring Program, where mean CI ranged from 0.04 to 0.45 in Michel Creek (Smit and Robinson 2023).

In summary, calcite presence in the receiving environment (Erickson, Gate, and Bodie creeks) was largely similar to previous years (pre-EVO SRF P2) in 2022 based on observations from the present study as well as the Regional Calcite Monitoring Program. Calcite presence in Michel Creek has been variable in all areas; however, Cc and CI scores have remained low. Additional years of data are needed to evaluate the potential cause of the anomalous low calcite values in 2021 (RG_ERCKUT, RG_ERCKDT and RG_MICOMP); however, it is unlikely these changes are related to the SRF as the pattern is seen both upstream and downstream of the SRF outfall. Given the variability in SRF operational status (i.e., Erickson Creek shutdown) and as such no antiscalant treatment, no conclusions around the cause of calcite variability among years associated with antiscalant dosing can be made in 2022.

3.3 Study Question #3

Study Question #3 (Has SRF water treatment and/or calcite prevention (e.g., antiscalant) (a) decreased aqueous concentrations of selenium and nitrate and/or (b) changed other mine-related constituents in effluent and the receiving environment (Erickson, Bodie, Gate, and Michel creeks)?) was evaluated through monitoring of water chemistry, including selenium speciation concentrations, throughout the EVO LAEMP study area. Aqueous concentrations of mine-related constituents are elevated in relation to the British Columbia Water Quality Guidelines (BCWQG), the Elk Valley Water Quality Plan (EVWQP) benchmarks, Updated effects Concentrations and Proposed Benchmarks when applicable (Appendix Table A.1).

Water chemistry data collected for the 2022 EVO LAEMP were of acceptable quality as characterized by good detectability, appropriate LRLs, minimal evidence of laboratory or field contamination, good laboratory and field precision and accuracy, and few hold time exceedances. Overall, the associated water chemistry data from ALS and BAL can be used with a high level of confidence in the derivation of conclusions.

3.3.1 Selenium and Nitrate

The removal of aqueous selenium and nitrate through SRF water treatment has been evident in Erickson, Gate, and Bodie creeks as significant changes in concentrations have been observed between periods of SRF operation and shutdown. Erickson Creek began receiving SRF discharge on February 15th, 2021, and on April 9, 2022, discharge of the SRF to Erickson Creek was paused to complete planned maintenance on the Erickson effluent pipeline. Due to the high BIT Se results observed in Erickson Creek, it was determined through Teck's AMP framework that treatment of Erickson Creek water would remain paused to further investigate the cause of

the increased BIT Se concentrations. The extended downtime allowed Teck to develop a robust trigger response plan (TRP) to support the restart of Erickson Creek treatment (Teck 2023a). A TRP was submitted October 3, 2022, with the discharge of treated effluent to Erickson Creek restarting on October 4, 2022. In 2022, when the SRF was shutdown, aqueous concentrations of selenium and nitrate were no longer significantly different between stations upstream and downstream of the SRF discharge location (Figure 3.4; Appendix Table D.1). Additionally, aqueous concentrations of selenium and nitrate increased significantly at stations in Erickson Creek downstream of the SRF outfall in 2022 during SRF shutdown compared to 2021, when the SRF was discharging into Erickson Creek (EV_ECOUT [RG_ERCKDT] and EV_EC1 [RG_ERCK]; Figure 3.5 and 3.6; Appendix Figure D.16; Appendix Table D.2). Gate and Bodie creeks began receiving SRF discharge on February 22nd, 2018 (EVO SRF P1), which continued until January 1, 2020, when SRF flow was reduced and then stopped discharging completely for 16 months (until January 1, 2022). As of January 2022, the SRF was discharging to both Gate and Bodie creeks. Aqueous concentrations of selenium (total and dissolved) and nitrate were significantly lower in Gate and Bodie creeks in 2022 (SRF discharging) compared to 2021 (SRF not discharging; EV_GT1 [RG_GATEDP] and EV_BC1 [RG_BOCK]; Figure 3.5 and 3.6, Appendix Figure D.16, Appendix Table D.2). Therefore, the results of water chemistry analyses of samples collected from Erickson, Gate, and Bodie creeks in 2021 and 2022 confirm that aqueous concentrations of selenium and nitrate decreased in the receiving environment when the SRF water treatment was active.

In 2022, the SRF removed 672 kg of selenium and 89,292 kg of nitrate decreasing selenium and nitrate loadings into the receiving environment. Concentrations of selenium and nitrate in Michel Creek did not change concurrently with specific changes in SRF operation (i.e., shutdown in Erickson), but the annual mean concentrations have decreased from the base year of monitoring, likely related to SRF treatment (RG_MIDER and RG_MICOMP). Aqueous concentrations of selenium in Michel Creek downstream of tributaries receiving SRF treatment (i.e., at EV_MC2 [RG_MICOMP]) were similar to concentrations in 2015 to 2020 but higher than 2021 in 2022 (Figure 3.7; Appendix Figure D.30; Appendix Table D.4), and concentrations at RG_MI3 (located upstream of treatment in Michel Creek) have increased over the same period. Overall, concentrations of selenium were higher at RG_MICOMP compared to RG_MI3, and the magnitude of difference was similar from 2017 to February 2021 regardless of SRF operation status. From March 2021 to the end of 2022, however, the magnitude of difference was slightly reduced (Appendix Figure D.30; appendix Table D.4), likely related to SRF treatment. Nitrate concentrations downstream at RG_MICOMP have decreased since base year (2015) and were lower during SRF treatment (2019 to 2022) compared to pre-SRF treatment (2015 to 2017). Aqueous selenium concentrations have been

Constituent was plotted because it was identified as a mine-related constituent in the Adaptive Management Plan and an early warning trigger was defined (Azimuth 2018). When biological monitoring areas and routine water quality stations were in close proximity to each other and with no additional inputs between them, data collected at the biological monitoring area were combined with routine data and plotted together with the biological monitoring area depicted in parenthesis.

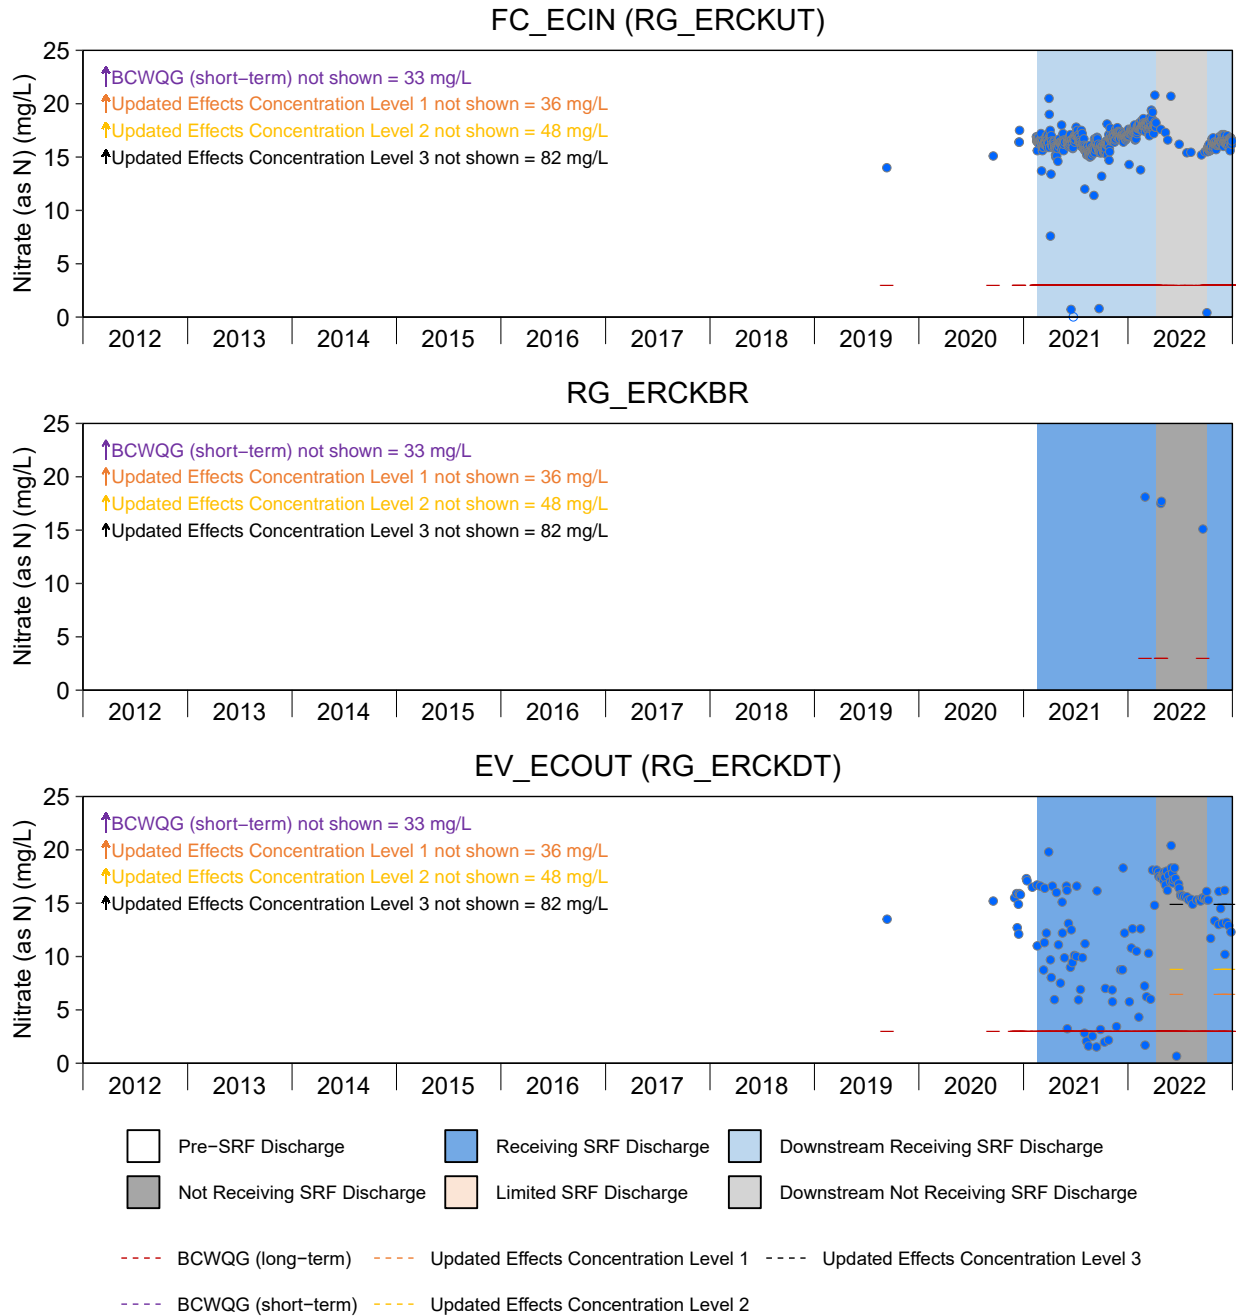

Figure 3.6: Time Series Plots for Nitrate from EVO LAEMP Areas, 2012 to 2022

Notes: Concentrations reported below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL. Guidelines are dependent on water hardness. Constituent was plotted because it was identified as a mine-related constituent in the Adaptive Management Plan and an early warning trigger was defined (Azimuth 2018). When biological monitoring areas and routine water quality stations were in close proximity to each other and with no additional inputs between them, data collected at the biological monitoring area were combined with routine data and plotted together with the biological monitoring area depicted in parenthesis.

above the long-term BCWQG, while nitrate concentrations have been below the Level 1 Updated Effects Concentrations at all stations on Michel Creek receiving mine-impacted water for the total monitoring period (EV_MC3A [RG_MIDER], RG_MIDGA, RG_MIDBO, EV_MC2 [RG_MICOMP]; Figure 3.5 and 3.6; Appendix Figure D.16; Appendix Tables A.1 and D.3).

Although total and dissolved selenium concentrations decreased in Erickson Creek after the commissioning of the SRF in 2021, the concentrations of selenite and some organoselenium species increased (selenate remained the dominate selenium species; Appendix Figures D.21 to D.28). In 2022, when SRF discharge to Erickson Creek was temporarily shut down, aqueous concentrations of selenite and the frequency of organoselenium detection decreased, suggesting that selenite and organoselenium concentrations were related to SRF operation (Appendix Figures D.21 to D.28). While the maximum aqueous concentration of selenite at F2_ECIN (RG_ERCKUT) in 2022 was 0.63 µg/L, the maximum aqueous concentrations of selenite at areas below the SRF outfall in Erickson Creek, specifically EV_ECOUT (RG_ERCKDT) and EV_EC1 (RG_ERCK), was 1.9 and 1.4 µg/L, respectively (Appendix Table D.3). Organoselenium species were largely undetected prior to EVO SRF P2, and upstream of the SRF (F2_ECIN [RG_ERCKUT]) and in 2022. No clear pattern related to SRF operation was observed in Gate and Bodie Creeks, where changes in selenite and organoselenium species fluctuate seasonally and with changes in mine operations (i.e., pit dewatering and water treatment; Appendix Figures D.21 to D.28). Selenite concentrations in Michel Creek in 2022 were consistent with previous years and organoselenium species were generally not detected in these areas. In Gate (EV_GT1 [RG_GATEDP]) and Bodie creeks (EV_BC1 [RG_BOCK]) organoselenium species were above the draft screening values¹¹ (0.025 µg/L expressed as the sum of dimethylselenoxide and methylseleninic acid; ADEPT 2022) for all samples collected in 2022 (Table D.6). Concentrations of these organoselenium species were mostly nondetectable in Erickson Creek in 2022 and were below this screening value in all areas of Michel Erickson creeks (Appendix Figures D.21 to D.28; Appendix Table D.6).

3.3.2 Other mine-related constituents in effluent

SRF influent source (i.e., Natal Pit or Erickson Creek) has the potential to change the concentrations of a number of mine-related constituents, several of which increased directly downstream of the SRF outfall in Erickson Creek during SRF operation (EV_EC1 [RG_ERCKDT]; Figure 3.4, Appendix Table D.1), and decreased in 2022 when the SRF was shutdown

¹¹ As noted in the 2021 Selenium Speciation Monitoring Program (ADEPT, 2021), "Patterns of bioaccumulation support a draft screening value of 0.025 µg/L (expressed as the sum of DMSeO and MeSe(IV)) to indicate conditions that might cause an incremental increase in bioaccumulation relative to the normal range of variation in monitoring data." The sum of DMSeO and MeSe(IV) in each water sample was calculated by substituting zero for organoselenium results that were below detection (i.e., <LRL = 0).

(Appendix Table D.2). These constituents included total antimony, total boron, total iron, total lithium, total manganese, total molybdenum, dissolved and total nickel, total uranium, total zinc, dissolved cadmium, dissolved cobalt, and dissolved iron (Figure 3.8; Appendix Figure D.4 to D.15; Appendix Table D.1 and D.2). Some changes, such as for total molybdenum, (Appendix Figure D.10) can be attributed to antiscalant addition to the SRF effluent; molybdenum is present in the antiscalant, and increased concentrations can be seen in streams across the Elk Valley that receive antiscalant treatment. Although concentrations of several constituents increased downstream of the SRF outfall during SRF operation, the majority of these constituents had concentrations below available water quality criteria (BCWQGs, EVWQP benchmarks, etc.) with the exception of total uranium, dissolved nickel, total cobalt, and dissolved copper (Figures 3.8 and 3.9; Appendix Table D.3). This increase is spatially constrained to Erickson Creek (RG_ERCKDT to RG_ERCK) and is not seen in Michel Creek (Appendix Table D.3). Concentrations of dissolved nickel downstream of the SRF outfall in 2022 at EV_ECOUT (RG_ERCKDT) and EV_EC1 (RG_ERCK) were above the Level 3 proposed benchmark in 42% of samples, while concentrations of total uranium were above the long-term BCWQG in 38% and 34% of samples, respectively (Appendix Table D.3). Concentrations of total cobalt and dissolved copper downstream of the SRF outfall in 2022 at EV_ECOUT (RG_ERCKDT) were above the long-term BCWQG in 21% and 12% of samples, respectively (Appendix Table D.3).

Changes related to SRF operations have not been observed for most other mine-related constituents in Gate, Bodie, and Michel Creeks due to confounding factors such as, pit dewatering and volume of treated water. Total antimony decreased following SRF operation in 2018 compared to the base year of monitoring in Michel Creek downstream of Gate and Bodie Creeks (EV_MC2 [RG_MICOMP]; Appendix Figure D.4, Appendix Table D.2). Aqueous concentrations of total antimony have also decreased in Gate and Bodie Creeks in 2022 (SRF discharging) compared to 2021 (SRF not discharging; EV_GT1 [RG_GATEDP] and EV_BC1 [RG_BOCK]; Appendix Figure D.4, Appendix Table D.2). Aqueous concentrations of total molybdenum increased significantly in 2022 compared to 2021 in Gate and Bodie creeks, likely due to the increase volume of antiscalant dosed into Gate and Bodie creeks in 2022 (EV_GT1 [RG_GATEDP] and EV_BC1 [RG_BOCK]; Appendix Figure D.10; Appendix Table D.2). Between 2021 and 2022, total and dissolved nickel did not change significantly in Gate or Bodie Creeks, while total uranium increased significantly by 15.6% in Gate Creek but did not change significantly in Bodie Creek (EV_GT1 [RG_GATEDP] and EV_BC1 [RG_BOCK]; Figures 3.8 and 3.9; Appendix Figure D.11; Appendix Table D.2). Aqueous concentrations of dissolved nickel and total uranium remained above the proposed benchmarks and guideline, respectively, at all stations in both Gate and Bodie Creeks in 2022 (Figure 3.8 and 3.9; Appendix Table D.3).

Concentrations of total uranium were above long-term BCWQG in 74% and 96% of samples at EV_GT1 [RG_GATEDP] and EV_BC1 [RG_BOCK], respectively, and concentrations of dissolved nickel were above the Level 3 Updated Effects Concentration in 67% and 100% of samples, respectively (Appendix Table D.3).

3.3.3 Supporting Data

3.3.3.1 Acute Toxicity Results

Acute toxicity testing (using the water flea [*D. magna*] and rainbow trout) was conducted with water collected from four EVO LAEMP mine-exposed areas in 2022, EV_ECOUT (RG_ERCKDT; n=37), EV_EC1 (RG_ERCK; n=46), EV_GT1 (RG_GATEDP; n=31), and EV_BC1 (RG_BOCK; n=31 and n=30 for water flea and rainbow trout, respectively; Table 3.2; Appendix Table D.7). Toxicity testing occurred at least monthly at each area, with a maximum of five events in a given month (e.g., EV_ECOUT in June). Only one test in 2022 (at EV_EC1) failed the acute toxicity criteria, where the toxicity test caused > 50% mortality in water flea (Table 3.2), this occurred when the EVO SRF was not discharging to Erickson Creek. A toxicity identification evaluation (TIE) was initiated on the remaining volume of water from the original sample and displayed no mortality in the untreated water. The final report for the TIE conducted by the external laboratory was not able to conclusively define the toxicant as no mortality was observed in the TIE. The TIE report did outline that based on the initial hardness and alkalinity of the sample, the observation of white precipitate in the original tests, the lack of BCWQG exceedances in the water quality data, and the results of the original *Daphnia magna* tests performed, calcite precipitation appeared to be the most likely cause of the observed toxic effect. A few individual water samples did show mortality to rainbow trout (EV_EC1 [n=3]; EV_ECOUT [n=5]) and water flea (EV_BC1 [n=1]; EV_EC1 [n=7]; EV_ECOUT [n=5]), but in all cases toxicity was ≤20% (Appendix Table D.7). Effluent collected at EV_GT1 did not cause mortality to either test species in toxicity tests throughout 2022. Further information regarding acute toxicity test can be found in the Annual Water Quality Monitoring Program (Teck 2023b).

3.3.3.2 Chronic Toxicity Results

Chronic toxicity testing under the Regional Chronic Toxicity Study (WSP 2023) is required under Permit 107517 at the EVO Compliance Point, EV_MC2 (RG_MICOMP). Testing started in 2015 and has been performed quarterly with the water flea (*C. dubia*) and algae (*P. subcapitata*), while semi-annual tests have been conducted with fathead minnow and rainbow trout (Table 3.3). In 2018, chronic toxicity testing with the amphipod, *H. azteca*, was initiated and has occurred one to three times per year thereafter. Water flea survival and reproduction when exposed to water from EV_MC2 showed “no adverse response” in 2022. One of the toxicity tests (in Q2)

Table 3.2: Summary of Acute Toxicity Test Results for EVO LAEMP Monitoring Stations, 2022

Water Station			Water Flea (<i>Daphnia magna</i>)		Rainbow Trout (<i>Oncorhynchus mykiss</i>)	
Teck Code	Description	Year	# Tests > 50% mortality	Total # Tests	# Tests > 50% mortality	Total # Tests
EV_ECOUT	Erickson Creek d/s of SRF Outfall (RG_ERCKDT)	2022	0	37	0	37
EV_EC1	Erickson Creek at Mouth (discharge to Michel Creek; RG_ERCK)	2022	1	46	0	46
EV_GT1	Gate Creek Sedimentation Pond Decant (RG_GATEDP)	2022	0	31	0	31
EV_BC1	Bodie Creek Sedimentation Pond Decant (RG_BOCK)	2022	0	31	0	30

 Acute toxicity test failure(s) (> 50% test mortality).

Notes: d/s = downstream, SRF = saturated rock fill.

Table 3.3: Results of Quarterly and Semi-Annual Chronic Toxicity Testing at EV_MC2, 2015 to 2022 (Golder 2016, 2017a, 2018, 2019, 2020a, 2021, 2022)

test categorized as no adverse response.
 test categorized as possible adverse response.
 test categorized as likely adverse response.
^M test had evidence of microbes in one or more replicates.

Notes: Q_x = Calendar year quarters; "-" = no data a) Possible and likely symbols are annotated with constituent identified as potentially contributing to observed response: H_RV = high inter-replicate variability; NO3 = nitrate; Ni = Nickel UN = unknown, no water quality constituent identified.

^a Results presented as percent survival or mean ± standard deviation.

^b Toxicity work in 2015 was not normalized to % control and thus is not shown.

^c *H. azteca* testing began in Q4 2018.

^d *H. azteca* testing was conducted in Q2 and Q4, per Permit 107517. Tests in Q2 were successfully conducted and survival was measured; however, test organisms were disposed prior to measuring dry weight due to a lab technician error.

with amphipods (*H. azteca*) was categorized as “likely adverse response” as evaluated by dry weight, but evidence for mine-related toxicity was weak (i.e., no water quality constituent was identified as potentially causing the effect; WSP 2023) and the test conducted in Q4 was categorized as “no adverse response” in both survival and dry weight. Both toxicity tests conducted with rainbow trout (in Q2 and Q4) showed “no adverse response” in all categories: survival, viability, length, and wet weight. One of the toxicity tests (in Q1) with fathead minnow was categorized as “likely adverse response” as evaluated by survival and biomass but no water quality constituent was identified as potentially contributing to the effect and the second test conducted in Q3 was categorized as “no adverse response” in all categories: hatch, survival, biomass, length, and normal development. Algae chronic toxicity testing in Q1, Q2, Q3, and Q4¹² of 2022 with water collected from EV_MC2 showed “no adverse response” to cell yield.

Temporal comparisons of chronic toxicity results for EV_MC2 indicated that observed organism responses (or lack thereof) for chronic toxicity testing in 2022 were similar to previous years. In addition, few adverse responses have been observed since initiation of testing in 2015, there is no apparent consistent pattern of responses, and there is no clear evidence of casual factors (WSP 2023), suggesting a lack of influence of the SRF (in either EVO SRF P1 or P2).

3.3.3.3 Sediment Quality

In September 2022, both RG_ERCKUT and RG_ERCKDT (upstream and downstream of the SRF outfall, respectively) had similar mean TOC values (8.46% and 9.96%, respectively), which were higher than values measured in sediments from Erickson Creek at the confluence with Michel Creek, RG_ERCK (3.05%). The higher TOC in upper Erickson Creek (RG_ERCKUT and RG_ERCKDT) is likely a result of additional detritus from decaying bryophytes that are not as abundant at RG_ERCK.

The mean September concentrations of seven metals (arsenic, cadmium, iron, manganese, nickel, selenium, and zinc) and twelve PAHs (acenaphthene¹³, acenaphthylene, anthracene, benz(a)anthracene, benzo(a)pyrene, chrysene, dibenz(a,h)anthracene, fluorene, 2-methylnaphthalene, naphthalene, phenanthrene, and pyrene) in sediment were above the lower BCWSQG at RG_ERCKDT, with eight of those constituents (cadmium, manganese, nickel, selenium, fluorene, 2-methylnaphthalene, Naphthalene, and phenanthrene) also above the

¹² Initial testing for *P. subcapitata* in Q4 indicated a likely adverse response for cell yield, but follow-up tests within two weeks yielded a result of “no adverse effect”.

¹³ Although acenaphthene was not detected in any replicate at RG_ERCKDT (and was not detected in a majority of EVO areas samples (~88%), due to the high detection limit associated with this compound uncertainty remains regarding the presence as well the possible concentration of this compound.

upper BCWSQG (Figure 3.10; Appendix Figure D.39 and D.40; Appendix Table D.8). For all these constituents, mean September concentrations in sediment were highest at RG_ERCKDT or RG_ERCKMD when compared to the other mine-exposed areas evaluated (RG_ERCKUT, RG_ERCK, RG_MI3, RG_MIDER, and RG_MICOMP; Appendix Figure D.5 Appendix Table D.8). Furthermore, a majority of these constituents at RG_ERCKDT had mean concentrations above the regional reference normal range (Appendix Figure D.6).

Concentrations of arsenic, cadmium, iron, manganese, nickel, and zinc increased directly downstream of the SRF outfall in 2022 compared to pre-SRF operations (RG_ERCKDT). Concentrations were higher downstream of the SRF outfall (RG_ERCKDT) when compared to upstream (RG_ERCKUT) in 2022 and 2021; although the magnitude of difference was smaller in 2022 (most likely due to the SRF shutdown). The increased concentrations of mine-related constituents were generally spatially constrained to just below the outfall (RG_ERCKDT), as similar changes were not seen in Erickson Creek at Michel Creek (RG_ERCK) or downstream of SRF treatment in Michel Creek (RG_MICOMP). Selenium concentration at RG_ERCKDT has constantly been elevated compared to RG_ERCKUT; the magnitude of difference was highest in 2021, when the SRF was discharging. At RG_ERCKUT (which is upstream of the SRF outfall), 11 of the 19 constituents (including cadmium, nickel, selenium, and some PAHs) exceeded the British Columbia Working Sediment Quality Guidelines (BC WSQG) and they were similar to pre-EVO SRF P2 concentrations (Figure 3.10; Appendix Table D.8). At RG_ERCK, cadmium, manganese, and nickel exceeded these criteria (Figure 3.10; Appendix Table D.8). At both RG_ERCKUT and RG_ERCK, the majority of sediment constituent concentrations have been stable or decreasing when comparing concentrations of 2022 to past results (2019, 2020 and 2021).

Mean sediment constituent concentrations in the area upstream of the Erickson Creek confluence with Michel Creek, RG_MI3, and both areas downstream of the confluence where sediment samples were collected, RG_MIDER and RG_MICOMP, were either below the BCWSQG or the regional reference normal range of the Elk Valley, and/or similar to results pre-EVO SRF P2 (Figure 3.10; Appendix Table C.2). Metal concentrations that exceeded the BCWSQG in these areas (such as arsenic, cadmium, nickel, and a few PAHs) also commonly exceeded guidelines in one or both reference areas (RG_MI25 and RG_ALUSM) suggesting that these constituents are naturally elevated in the Elk Valley (Figure 3.10). Overall, sediment metal and PAH concentrations in lower Erickson and Michel Creek were largely similar pre- and post-EVO SRF P2 suggesting a minimal influence of the SRF on these constituents.

Although a number of mine-related constituents in sediment increased downstream of the SRF outfall and had concentrations that exceeded the BCWSQG and the regional reference normal

range of the Elk Valley, the elevated sediment metal and PAH concentrations appeared localized to directly below the SRF outfall (RG_ERCKDT and RG_ERCKMD). The cause of the elevated sediment constituent concentrations (selenium, iron, and manganese) at RG_ERCKDT (when comparing results from 2019 and 2020 to 2021 and 2022) is currently being evaluated as part of the AMP response framework (in conjunction with the investigation into the cause of elevated BIT selenium concentrations downstream of the SRF outfall). Concentrations of metals and PAHs at the mouth of Erickson Creek (RG_ERCK) and in Michel Creek (RG_MIDER and RG_MICOMP) that were above BCWQG were within the regional reference normal range, and/or similar to past years suggesting that the SRF had minimal to no influence on sediment chemistry in lower Erickson Creek and Michel Creek.

3.3.4 Summary

In summary, during SRF operation in 2022 concentrations of selenium and nitrate decreased in the receiving environment of Erickson Creek as well as Gate and Bodie creeks. In contrast, concentrations of selenium and nitrate in Michel Creek did not change concurrently with changes in SRF operation but have decreased from pre-SRF operation (nitrate) or remained similar to pre-SRF operation (selenium). A number of other mine-related constituents increased in the receiving environment downstream of the SRF treatment following operation, due to changing sources of influent. All of the constituents that increased, except dissolved nickel and uranium, were below the available water quality criteria in Erickson Creek (Proposed Benchmarks and BCWQG, respectively). Increases in these constituents is likely due to higher concentrations present in water directed to the SRF for treatment from Natal Pit. The elevated concentrations are spatially constrained to Erickson, Gate and Bodie Creeks and similar trends are not observed in Michel Creek suggested that the SRF had a minimal negative influence in the downstream receiving environment. The elevated sediment metal and PAH concentrations from SRF treatment also appear to be localized to a relatively small area directly downstream of the SRF outfall (RG_ERCKDT and RG_ERCKMD). In lower Erickson Creek (RG_ERCK) and Michel Creek, the concentrations of the majority of sediment constituent concentrations are similar to concentrations pre-SRF treatment and within regional normal ranges suggesting that the SRF had minimal influence on sediment chemistry in the downstream receiving environment.

3.4 Study Questions #4

Study Question #4 (Have benthic invertebrate tissue selenium concentrations changed as a result of the SRF in Erickson, Bodie, Gate, and Michel creeks?) was evaluated through the monitoring of composite-taxa benthic invertebrate tissue selenium concentrations throughout the study area monthly March through to the end of the year. A detailed analysis of the causal factors associated with changing BIT Se concentrations can be found in the 'Investigation Into Enhanced Selenium

Bioaccumulation in Benthic Invertebrate Tissue in Erickson Creek' (Table 2.2 and 2.3; Teck 2023a).

Benthic invertebrate tissue data collected for the 2022 EVO LAEMP were of good quality as characterized by excellent detectability, appropriate LRLs, and excellent laboratory precision and accuracy. Therefore, the associated data can be used with a good level of confidence in the derivation of conclusions for this study.

3.4.1 Spatial Benthic Invertebrate Tissue Trends

Mean composite-taxa benthic invertebrate tissue (BIT) selenium concentrations at three mine-exposed areas in September 2022, RG_BOCK (directly below the settling pond in Bodie Creek), RG_GATE (above the settling pond in Gate Creek), and RG_GATEDP (directly below the settling pond in Gate Creek), exceeded the EVWQP Level 1 Benchmark for effects to benthic invertebrates (as well as the EVWQP Level 2 and Level 3 benchmarks for RG_GATEDP and RG_BOCK, respectively), were above the regional reference normal range, and were higher than the reference areas (RG_ALUSM and RG_MI25; Figure 3.11; Appendix Table F.1). RG_ERCKDT (directly below the SRF outfall) had mean BIT Se concentrations above the regional normal range but below the EVWQP Level 1 benchmark in September.

Of the areas where mean BIT selenium concentrations exceeded the Level 1 benchmark during LAEMP sampling in September 2022 (RG_GATE, RG_BOCKRD and RG_BOCK), only RG_BOCK had BIT selenium concentrations that increased when compared to pre-EVO SRF operation or the base year for comparisons (Figure 3.12; Appendix Table F.2). Several BIT samples from RG_BOCK in 2022 (n=6), had a proportion of annelids that met the criteria to evaluate annelids separately¹⁴ and the 'annelid only' tissue replicates were higher than most of the composite samples (Appendix Table F.1). Overall, the presence of annelids in these samples confound the interpretation of trends in BIT selenium concentrations, as they often have significantly higher Se concentrations and are more variable than the composite samples.

Mean BIT selenium concentrations in all other areas evaluated as part of the EVO LAEMP, including the area above the SRF outfall (RG_ERCKUT), the area at the confluence of Erickson and Michel Creek (RG_ERCK), as well as the entire study area of Michel Creek, which is the receiving water body for Erickson Creek, Gate Creek, and Bodie creeks (RG_MI3 [which is above the Erickson and Michel Creek confluence], RG_MIDER, RG_MIDGA, RG_MIDBO,

¹⁴ As noted in the methods, annelids were only included in the composite-taxa tissue sample if the proportion of annelids was >5% of the total biomass sample, and if so, an additional 'annelids only' sample was also evaluated. This process started in September 2021 as previous assessments have suggested that the presence of annelids in composite-taxa BIT samples may bias the results high (Golder 2021b). Annelids were not found at a high enough proportion in December sampling for any area to be evaluated separately.

Figure 3.11: Selenium concentrations in Composite-taxa Benthic Invertebrate Samples Collected at Reference (Green) and Mine-Exposed (Blue) Areas of Bodie, Erickson, Gate, and Michel Creeks, EVO LAEMP, 2022

Notes: Samples outlined in purple had oligochaetes present. Area between the black lines represents the reference area normal range defined as the 2.5th and 97.5th percentiles of the distribution of reference area data (pooled 1996 to 2020 data) reported in the Regional Aquatic Effects Monitoring Program (RAEMP). Black horizontal lines represent the measure of central tendency (mean for untransformed data, geometric mean for log10 transformed data, and median for rank transformed data). Areas that do not share a letter (e.g. a, b, c) are significantly different ($\alpha = 0.05$) in a Tukey's HSD test following a one-way ANOVA by area. In December sampling only took place at RG_MIDGA, so no statistical analyses were run for December 2022 data. SRF Operational (blue shading) only applies to mine-exposed areas.

and RG_MICOMP), were below the EVWQP Level 1 benchmark for effects to benthic invertebrates in 2022. In January only, mean selenium concentrations in samples from RG_MIDGA were above the EVWQP level one benchmark for fish growth (11 mg/kg dw). The mean BIT selenium concentrations in Michel Creek were only slightly above the regional reference normal range. Furthermore, mean BIT Se concentrations upstream and downstream of all SRF-affected tributaries in Michel Creek (RG_MI3 and RG_MICOMP) were not statistically different suggesting that elevated BIT selenium concentrations were localized to a small area within upper Erickson Creek and Gate and Bodie creeks.

Observed selenium results in BIT from 2022 were compared to the selenium speciation bioaccumulation tool (B-tool; de Bruyn and Luoma 2021) to better understand the relationships between aqueous selenium and BIT selenium concentrations. The b-tool provides insight into selenium bioaccumulation in relation to samples collected previously in the Elk River watershed (Golder 2020b). Field-measured mean benthic invertebrate tissue selenium concentrations from stations downstream of the SRF outfall in Erickson Creek (RG_ERCKDT, and RG_ERCKMD) as well as from Bodie (RG_BOCKRD and RG_BOCK) and Gate (RG_GATE and RG_GATEDP) creeks were considerably higher than the b-tool predicted Se concentrations for most samples (Appendix Table F.5). The results from this comparison suggested that samples fall outside the typical range in the Elk Valley and that factors other than selenium speciation alone may be driving selenium bioaccumulation in the SRF-influenced tributaries within the EVO LAEMP study area. More details on the potential drivers of selenium bioaccumulation in Erickson Creek can be found in 'Investigation Into Enhanced Selenium Bioaccumulation in Benthic Invertebrate Tissue in Erickson Creek' (Teck 2023a). In contrast to Erickson, Gate, and Bodie Creek areas, the B-tool was able to accurately predict BIT selenium concentrations for areas in Michel Creek as well as reference areas (RG_ALUSM and RG_MI25; Appendix Table F.5).

Selenium concentrations in BIT was also assessed against the biological trigger (see section 1.4 and Appendix G for details). The purpose of the biological triggers is to quickly identify biological monitoring areas where unexpected biological conditions may be occurring that may require management action. This was completed for each replicate from EVO LAEMP monitoring areas where water quality projections are available for each sampling event. The biological trigger for BIT selenium concentrations was exceeded in most replicates from both RG_BOCK and RG_GATE (for all sampling events). The BIT selenium concentration at RG_ERCK in Erickson Creek and the two areas evaluated in Michel Creek, were below the biological trigger threshold.

3.4.2 Temporal Benthic Invertebrate Tissue Trends

The mean BIT Se concentrations at RG_ERCKDT often exceeded the EVWQP Level 1 benchmarks during the additional sampling events associated with the Erickson Creek selenium investigation (March, April, May, June, and July) and occasionally exceeded the EVWQP Level 2 (March and April) and Level 3 benchmarks (April). As a result of increases BIT Se concentrations in 2021 and 2022 in upper Erickson Creek downstream of the EVO SRF P2 outfall, further investigation of the causal factors was initiated through Teck's AMP response framework. This Investigation into Enhanced Selenium Bioaccumulation in Benthic Invertebrate Tissue in Erickson Creek summary report (Teck 2023a) identified SRF-derived particles as the primary driver of the observed BIT Se increases in upper Erickson Creek and additional details can be found in the full report (See section 4 for more details; Teck 2023a).

BIT Se concentrations were highest at RG_ERCKDT in the spring of 2022 (March and April). On April 9, 2022, discharge of the SRF to Erickson Creek was paused to complete planned maintenance on the Erickson effluent pipeline. Due to the high BIT Se results observed in Erickson Creek, it was determined through Teck's AMP framework that treatment of Erickson Creek water would remain paused to further investigate the cause of the increased BIT Se concentrations could be completed. Following the shutdown of SRF discharge to Erickson there was a reduction in BIT Se concentrations and by October 2022 (6 months post-shutdown) BIT Se concentrations at RG_ERCKDT had return to concentrations observed prior to SRF discharge and were not statistically different than upstream (RG_ERCKUT; Figure 3.13; Appendix Table F.3). Post SRF restart, BIT Se concentrations increased at RG_ERCKDT and were elevated compared to RG_ERCKUT in (November and December 2022) but have remained at or below the EVWQP Level 1 benchmark for effects to benthic invertebrates. BIT selenium concentrations in Michel Creek upstream of Erickson Creek (RG_MI3) compared to downstream (RG_MIDER) were similar during all sampling events, suggesting a localized effect of SRF discharge in 2022 (Figure 3.14; Appendix Tables F.2 to F.4).

3.4.3 Summary

In summary, in 2022, the influence of the SRF on BIT selenium concentrations was isolated to a directly below the SRF outfall in Erickson Creek (RG_ERCKDT). Mean BIT selenium concentrations in Gate, Bodie, and upper portions of Erickson Creek (downstream of the SRF outfall) were above the Level 1 benchmark for effects to benthic invertebrates in 2022. In contrast, mean BIT selenium concentrations at the confluence of Erickson Creek and Michel Creek (RG_ERCK) and the study areas in Michel Creek were all below EVWQP benchmarks and mostly within the normal range (for more details see Section 4; Teck 2023a). The elevated levels of Se in BIT were observed in upper Erickson Creek from September 2021

to March 2022 triggered an evaluation of different pathways of selenium enrichment of benthic tissue. This investigation identified strong evidence that SRF-derived particles are the primary driver of the observed BIT Se increase in upper Erickson Creek (See Section 4 for more detail). Additional details can be found in the full report (See section 4 for more details; Teck 2023a).

3.5 Study Questions #5

Study Question #5 (Are there changes in the benthic invertebrate community in Erickson, Bodie, Gate, and Michel creeks associated with SRF treatment (including calcite prevention)?) was evaluated through monitoring of BIC endpoints.

Benthic invertebrate community data collected for the EVO LAEMP were of excellent quality as characterized by excellent sub-sampling precision and accuracy, sorting efficiency and taxonomic identification accuracy. Therefore, the associated data can be used with a high level of confidence in the derivation of conclusions.

3.5.1 Benthic Invertebrate Community

Temporal changes in endpoints related to benthic invertebrate community (BIC) structure as determined by kick and sweep (i.e., CABIN) sampling in Erickson and Michel creeks downstream of SRF discharge were evaluated throughout the study area (Appendix Tables F.7 to F.18) and relative to reference areas in Alexander and Michel creeks, other mine-exposed areas in Michel Creek, and regional and habitat-adjusted normal ranges defined in the RAEMP (Appendix Figures F.1 to F.13; Minnow 2020b). Richness (# of taxa at Lowest Practical Level [LPL]) was within or above the regional and habitat-adjusted normal ranges at mine-exposed sites in Michel Creek and reference sites in Michel and Alexander creeks between 2012 and 2022 (Figure 3.15; Appendix Figure F.1). Downstream of the SRF outfall at RG_ERCKDT, taxa richness was largely within the regional normal range and the habitat-adjusted normal range, and greater than upstream of the SRF outfall at RG_ERCKUT where richness was below the habitat-adjusted and normal range in 2020, 2021 and 2022 (Appendix Figure F.1). Further downstream in Erickson Creek at RG_ERCK, taxa richness in 2022 was within the normal range and habitat-adjusted range and similar to all pre-EVO SRF P2 years except 2012 (Appendix Figure F.1). In general, no effects associated with the SRF outfall are apparent in taxa richness (Appendix Table F.6).

Total organism abundance and EPT abundance (i.e., # of organisms/ 3-min kick) were within regional reference normal ranges and within or above habitat-adjusted normal ranges in all sampled years at all areas (mine-exposed and reference; Figures 3.15; Appendix Figures F.2 and F.3), except the reference area RG_MI25 where interannual variability resulted in abundance

and EPT abundance lower than the habitat-adjusted normal range in multiple years (i.e., 2012, 2019, 2020 and 2022; Appendix Figures F.2 and F.3). Total abundance and abundance of key BIC endpoints (EPT abundance) remained high throughout the study area, indicating no limitations of food available to fish in areas where they are present. In 2022 compared to 2021, there was no change in total abundance at any station in Erickson, Michel, Gate, or Bodie creeks (Appendix Table F.6). In 2022, EPT abundance was lower downstream (RG_ERCKDT) of the SRF compared to upstream (driven by a lower P abundance at RG_ERCKDT compared to RG_ERCKUT; Appendix Table F.5). These samples were, however, collected post-SRF shut down in Erickson Creek, and given only a single year of monitoring during SRF discharge into Erickson Creek (2021), the relationship with SRF discharge is unclear.

Despite EPT abundance within regional reference normal ranges, % EPT in 2022 fell below the regional and habitat-adjusted normal ranges at areas downstream of the SRF outfall in Erickson Creek (RG_ERCKDT and RG_ERCK); however, proportions were similar in 2022 compared to 2021 (Figure 3.15; Appendix Figure F.4). A similar pattern was also noted, to a lesser degree, upstream of the SRF outfall at RG_ERCKUT where % EPT was lower in 2021 compared to 2020 and 2019; and were similar in 2022 compared to 2021 (Appendix Figure F.4). Further downstream at RG_ERCK, % EPT has remained stable since 2019 (Appendix Figure F.4). In Gate and Bodie (RG_GATE and RG_BOCK) creeks %EPT falls below both the regional and habitat-adjusted normal ranges; this is most likely due to habitat characteristics (e.g., substrate quality) rather than SRF discharge (Figure 3.15; Appendix Figure F.4). Habitat at RG_GATE and RG_BOCK do not meet CABIN requirements and therefore interpretation of results from these areas against normal ranges developed based on reference areas consistent with CABIN requirements should be viewed with caution. At other mine-exposed areas in Michel Creek and reference areas in Michel and Alexander creeks, % EPT was within or above the regional normal ranges in all sampled years, except at RG_MICOMP in 2022 which fell below the regional normal range in all replicates (Appendix Figure F.5). Data from the 2022 RAEMP suggests that decreases BIC abundance in 2022 may be more likely driven by a regional environmental driver than mine-related activities. The 2022 RAEMP report will conduct additional analyses to tease out potential environmental drivers within the data set. Michel Creek areas downstream of Erickson, Gate, and/or Bodie creeks (RG_MIDGA, RG_MIDBO, and RG_MICOMP) fell below the habitat-adjusted normal ranges for % EPT in 2022 and recorded proportional decreases compared to 2021 (Appendix Table F.8). These compositional changes are mirrored by increases in the relative abundance of Chironomidae in 2022 compared to 2021. However, given the variability (% EPT increased at these areas in 2021 compared to 2019) and the limited data post-SRF operation data it is unclear if changes are associated with SRF discharge, mine-related impacts, or yearly variability in Michel Creek.

Lower % EPT at RG_ERCKDT in 2022 and RG_ERCK from 2019 to 2022 appears to be driven by low total and relative abundance of Ephemeroptera and high total and relative abundance of Chironomidae at all sampling areas in Erickson Creek (Figure 3.15; Appendix Figures F.5 and F.6). Total Ephemeroptera and % Ephemeroptera were below the regional and habitat-adjusted normal ranges at all three areas in Erickson Creek (RG_ERCKUT, RG_ERCKDT, and % Ephemeroptera at RG_ERCK) in all samples collected since 2018 (Figure 3.15; Appendix Figures F.5 to F.7). Conversely, the total and relative abundance of Plecoptera was within or above the regional normal range at RG_ERCKUT and RG_ERCKDT and was highest at RG_ERCKUT and RG_ERCKDT when compared to the other study areas, though relative abundance at RG_ERCKDT declined in 2021 and 2022 compared to 2019 and 2020 (Figure 3.15; Appendix Figures F.8 and F.9). Trichoptera total and relative abundance, although generally lower at areas in Erickson Creek than at reference areas and areas in Michel Creek, were also within the regional normal range between 2018 and 2022 (Figure 3.15; Appendix Figures F.10 and F.11).

The total abundance of Chironomidae has been high at RG_ERCK since 2018, often exceeding the regional normal range, and increased at RG_ERCKUT and RG_ERCKDT in 2021 and remained high in 2022 relative to earlier sampled years (Appendix Figure F.12). These observed high abundances of Chironomidae translated to higher % Chironomidae, which were above the regional normal range at RG_ERCK from 2018 to 2022 and at RG_ERCKDT in 2021 and 2022 (Appendix Figure F.13). The shift in community composition at RG_ERCKDT (increase in % Chironomidae and decrease in % Plecoptera), although coinciding with commissioning of EVO SRF P2 in early 2021, occurred at areas both upstream and downstream of the SRF outfall (in 2021) and continued in 2022 (at RG_ERCKDT) despite SRF shutdown to Erickson through most of the growing season; therefore, this shift does not appear to be directly related to SRF discharge.

Relative abundance of EPT was also assessed against the biological trigger established for this endpoint (see Appendix G for details). This was completed for each replicate from EVO LAEMP monitoring areas where water quality projections were available for each sampling event in 2022 (i.e., September sampling at RG_ERCK, RG_MI3, RG_MICOMP; see Appendix G for details). Biological trigger results indicated that of the three mine-exposed areas evaluated RG_ERCK and RG_MICOMP had % EPT that reached the biological trigger criteria (i.e., % EPT was below the biological trigger).

In summary, BIC endpoints including taxa richness and % EPT were lower than reference and below regional and/or habitat-adjusted normal ranges at some areas in Erickson Creek in 2022. Investigation of spatial and temporal trends indicated that these differences were either observed

both up- and downstream of the SRF outfall (e.g., decrease in % EPT at both RG_ERCKUT and RG_ERCKDT) and/or were observed prior to commissioning for EVO SRF P2 (e.g., lower taxa richness at RG_ERCKUT; lower % EPT at RG_ERCK). Overall, while BIC effects were apparent in Erickson Creek and Michel Creek, these effects were present prior to SRF commissioning, have not changed substantially over time, and/or have been variable through time, indicating minimal effects of the SRF. Total abundance and abundance of key BIC endpoints (EPT abundance) remained high throughout the study area, indicating no limitations of food available to fish in fish bearing areas of Erickson or Michel creeks.

3.6 Study Questions #6

Study question #6 (Is SRF water treatment affecting indicators of productivity (e.g., phosphorus) in the receiving environment?) was evaluated through monitoring changes in phosphorus, benthic invertebrate density, and biomass and periphyton coverage.

3.6.1 Phosphorus

The EVO SRF operational status coincided with changes in phosphorus and orthophosphate concentrations over time in Erickson Creek. Concentrations of total phosphorus increased significantly downstream of the SRF outfall at EV_ECOUT (RG_ERCKDT) and EV_EC1 (RG_ERCK) in 2022 (SRF shutdown for six months) compared to 2021 (SRF discharging), decreased concentrations of nitrate, phosphorus, and orthophosphate were noted below the outfall of the SRF in Erickson Creek in 2021 (Figure 3.16; Appendix Table D.2; Minnow 2022b). Orthophosphate also increased significantly downstream of the SRF outfall at EV_ECOUT (RG_ERCKDT) in 2022 compared to 2021, but no changes were observed downstream at EV_EC1 (RG_ERCK; Figure 3.17; Appendix Table D.2). Concentrations of phosphorus and orthophosphate have not changed with SRF operation in Gate and Bodie Creeks (Figure 3.16 and 3.17; Appendix Table D.2). Significant decreases in orthophosphate were observed in Michel Creek in 2022 compared to 2021 at stations upstream (EV_MC3 [RG_MI3]) and downstream (EV_MC2a and EV_MC2 [RG_MICOMP]) of tributaries receiving SRF discharge (Figure 3.17, Appendix Table D.2), but remained within the historical range of concentrations at all stations except for EV_MC2 (RG_MICOMP). No significant changes in total phosphorus were observed in any Michel Creek stations in 2022 compared to previous years. Concentrations of phosphorus were within the normal reference range (0.3 µg/L; Minnow 2020c) in Erickson in 2022 and the increase in 2022 has not affected other indicators of productivity (i.e., BIC biomass [Section 3.6.2], or periphyton visual scores [section 3.6.3]).

3.6.2 Biomass and Density

The total density of benthic invertebrates determined by Hess sampling in Erickson Creek in September 2022 showed no difference between RG_ERCKDT, downstream of the SRF water treatment outfall, and RG_ERCKUT, upstream of the SRF water treatment outfall in any endpoints (Figure 3.18), in contrast to 2021, when total density of benthic invertebrates was significantly higher at RG_ERCKDT compared to RG_ERCKUT. This difference in 2021 was driven by significantly higher densities of most major taxa at RG_ERCKDT, including Ephemeroptera, Plecoptera, and Chironomidae, as well as combined EPT density, which returned to values similar to upstream in 2022 (Figure 3.18; Appendix Tables F.4 and F.5). In 2021, greater organism densities at RG_ERCKDT compared to RG_ERCKUT suggested higher benthic invertebrate productivity immediately downstream of the SRF outfall in Erickson Creek, likely related to the elevated temperatures observed during the summer months at RG_ERCKDT in that year (Section 3.1). This increase on BIC biomass and density was not apparent in 2022, most likely due to SRF shutdown during the growing season leading to lower temperatures at that time compared to 2021.

3.6.3 Visual Periphyton Coverage

In September 2022, mean periphyton coverage was moderate at the reference study area (RG_ALUSM) and at all mine-exposed study areas evaluated, except RG_ERCK, and RG_BOCK (Appendix Table E.1). These sites all had mean visual periphyton coverage scores between 2 and 3 of a possible range from one (rocks not slippery and no obvious colour) to five (rocks mostly obscured by algae mats; Environment Canada 2012a). Moderate coverage in Gate, and Michel Creek are similar from previous existing conditions work in 2020 to 2022 (Minnow 2020a, 2021a, Minnow 2022b). RG_ERCK, near the confluence with Michel Creek, had a score of 5, where as Bodie Creek had a score of 1. The high periphyton score at RG_ERCK is consistent with 2021 (Minnow 2022b). There were no patterns in visual periphyton score associated with SRF discharge in 2022.

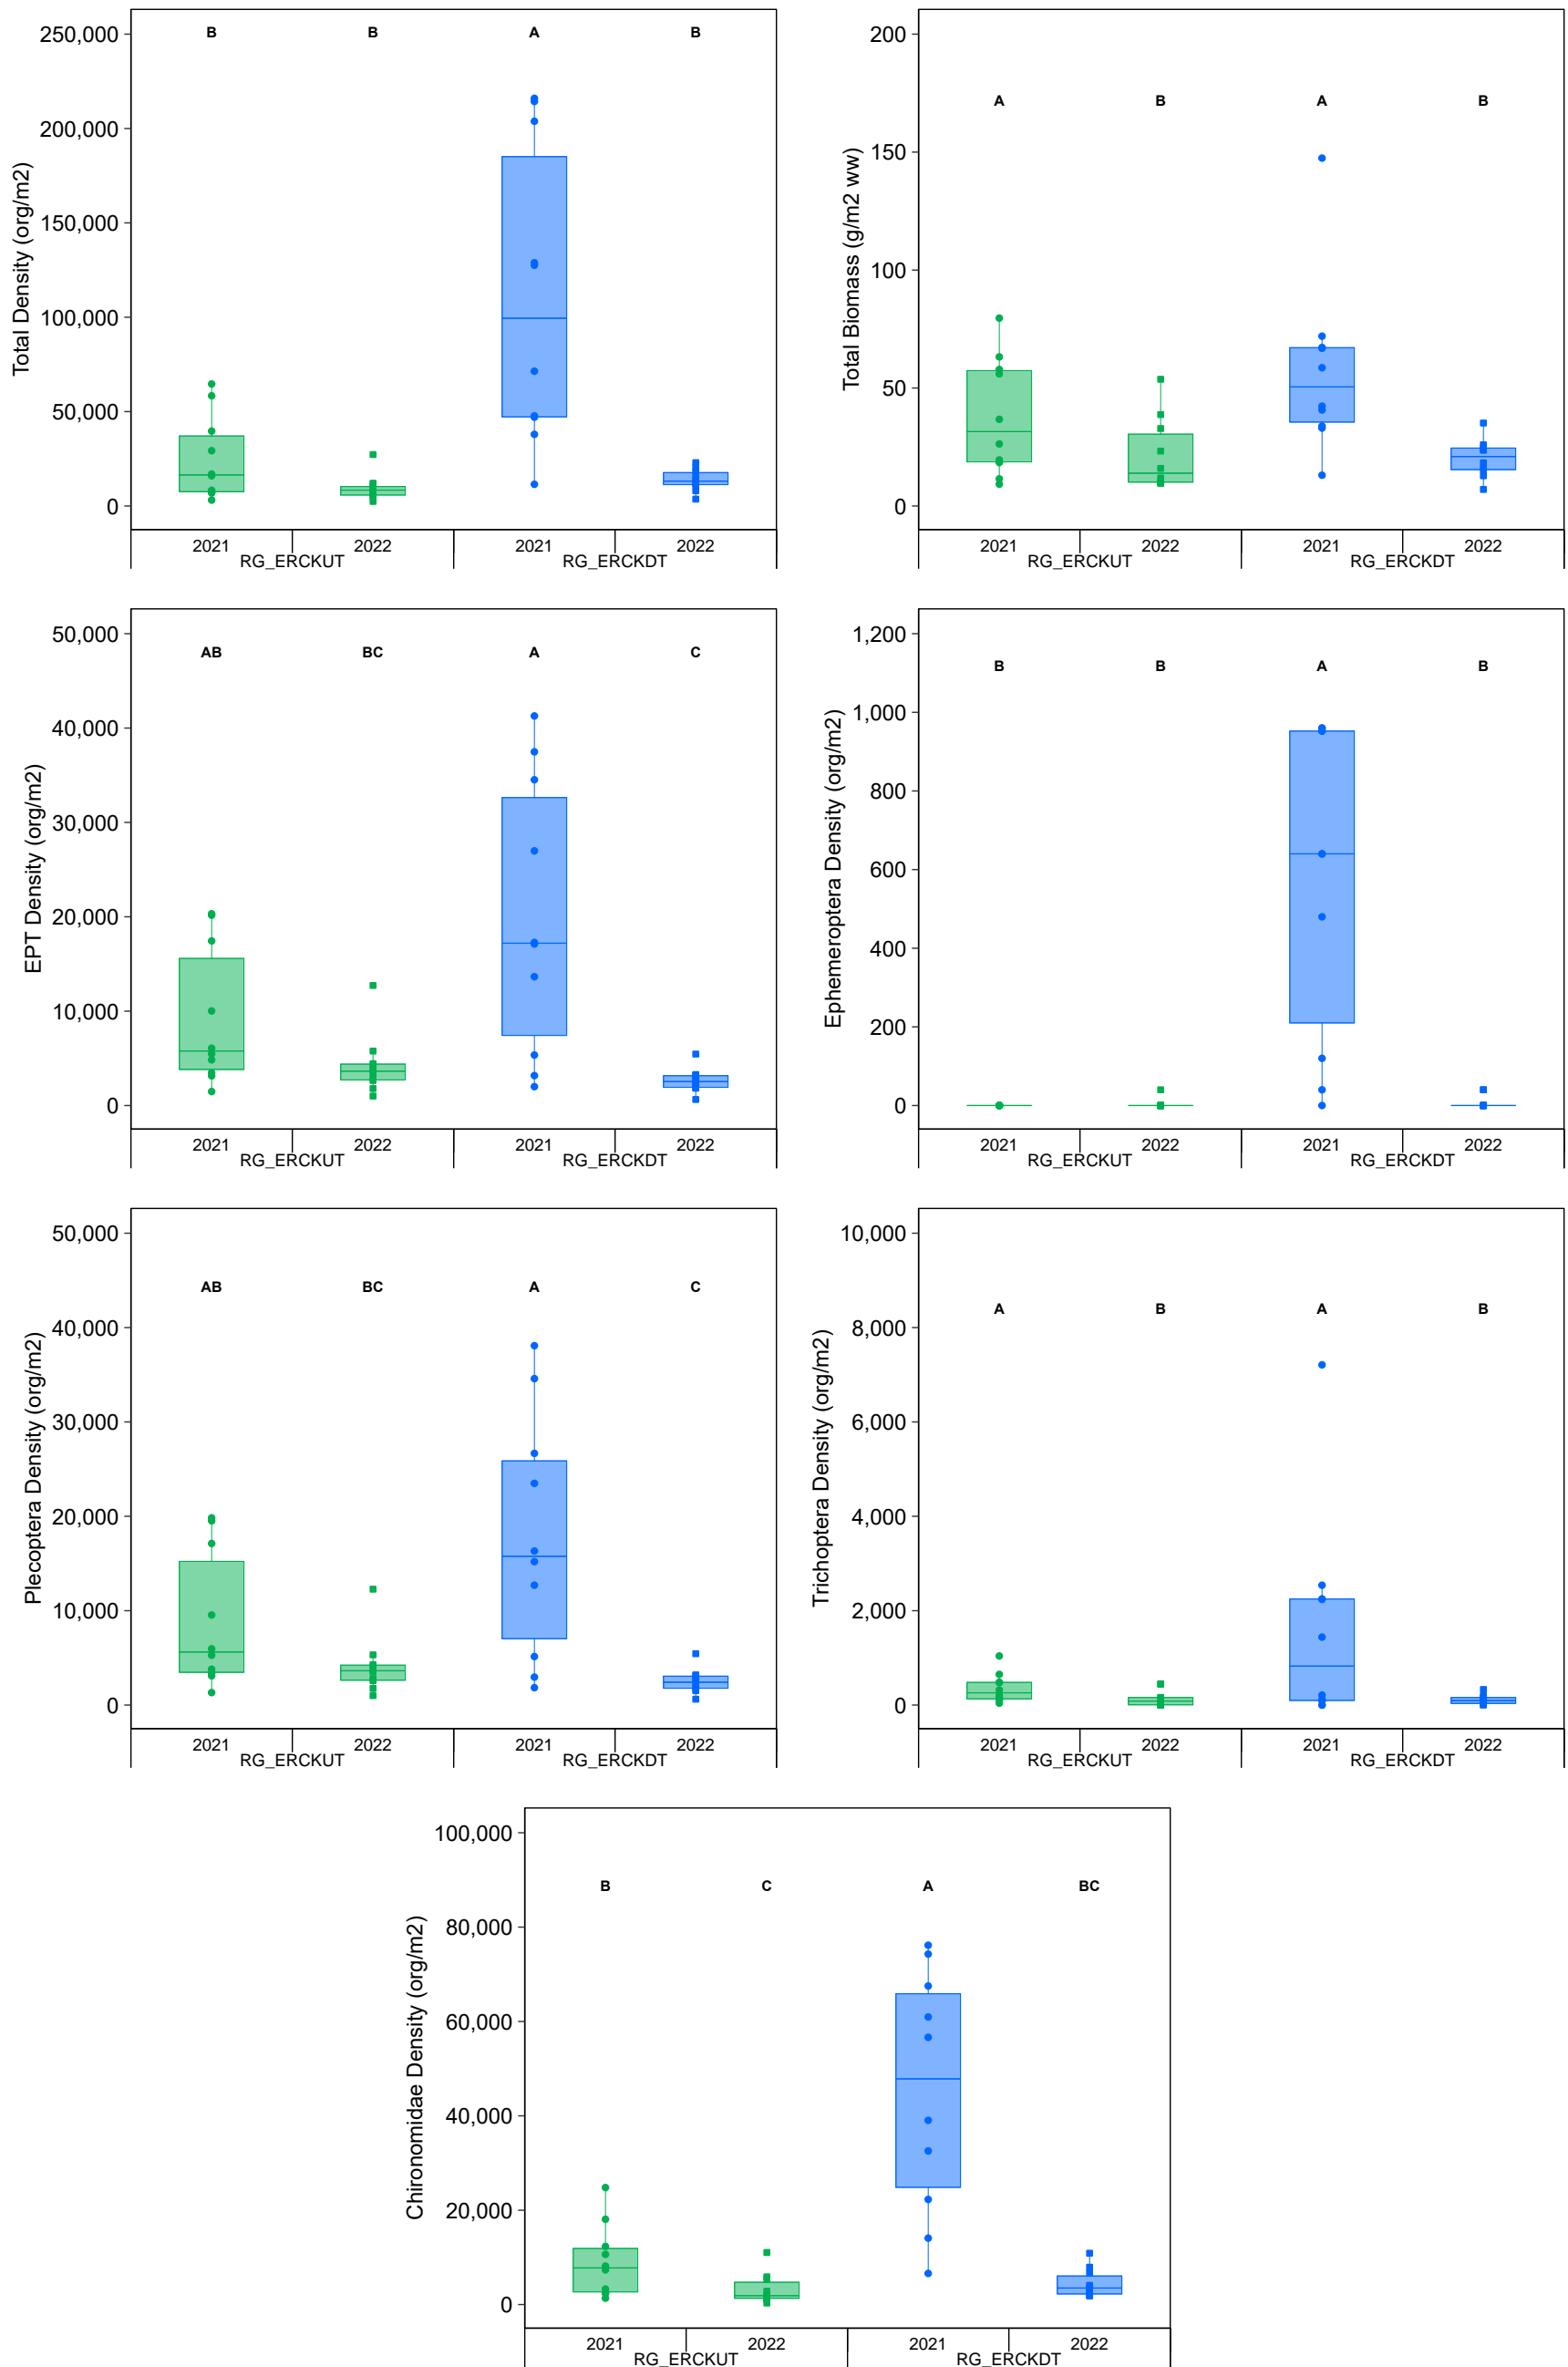

Figure 3.18: Benthic Invertebrate Density and Biomass Metrics Collected by Hess Sampling for Upstream (RG_ERCKUT) and Downstream (RG_ERCKDT) Areas, EVO LAEMP, September 2021 and 2022

Notes: Areas that share a letter are not significantly different (p-value=0.1). Each sampling event consisted of 10 samples.

4 INTEGRATED SUMMARY AND CONCLUSIONS

The EVO LAEMP report discusses key questions related to current biological conditions within the study area. The study questions are focused on water quality and the biological effects of SRF operation on the receiving environments of Erickson, Gate, Bodie, and Michel creeks.

In 2022, the SRF removed 89,292 kg of nitrate and 672 kg of selenium decreasing selenium and nitrate loadings into the receiving environment. During SRF operation, concentrations of nitrate and selenium decreased in Erickson Creek as well as Gate and Bodie creeks. In Michel Creek, concentrations of total selenium and nitrate have decreased compared to the base year of monitoring, likely related to SRF treatment. As expected in 2022, during SRF shutdown in Erickson Creek, temperature, and benthic proxies of productivity (i.e., benthic biomass and density) returned to pre-SRF P2 operation conditions.

While the changes observed in water quality, temperature, and productivity in 2022 were expected based on SRF operational status, changes in calcite presence and benthic invertebrate community were less clear. Calcite in the receiving environment (Gate, Bodie, and Erickson creeks) was largely similar to pre-EVO SRF P2 operation in 2022; however, it is unclear if the shifts in 2022 compared to 2021 were related to SRF operation, as shutdown (no antiscalant treatment), during the late spring and summer of 2022 precludes any conclusions around the cause of calcite variability among years. Lastly, while effects to benthic invertebrate community in relation to reference normal ranges were apparent in Erickson Creek and Michel Creek, they were either present prior to SRF commissioning, have not changed substantially over time, and/or have been variable through time in a manner inconsistent with SRF operation, indicating multiple influences, both natural and stressor-related, on BIC, and suggests minimal effects of SRF operation. Additional years of data will be beneficial to assess changes in calcite and BIC associated with SRF water treatment.

Samples collected for the 2021 EVO LAEMP identified an unexpected increase in BIT selenium concentrations compared to pre-EVO SRF P2 Operation in Upper Erickson Creek (RG_ERCKDT). Confirmatory sampling in December 2021 and March 2022 showed BIT Se concentrations above Level 1, and in some cases, Level 2 and 3 EVWQP benchmarks for effects to benthic invertebrates. Elevated BIT Se concentrations were spatially constrained to the upper reaches of Erickson Creek and no changes in BIT Se concentrations were recorded at either the confluence of Erickson Creek and Michel Creek or further downstream in Michel Creek. The concentrations of Se in BIT in upper Erickson Creek could not be accounted for through known aqueous bioaccumulation mechanisms (e.g., Se bioaccumulation model relationships between concentration of aqueous Se species to BIT Se concentrations), indicating another

source of bioavailable Se in upper Erickson Creek. This outcome triggered further investigation under Teck's Adaptive Management Plan Response Framework, including increased monitoring, and the development of the Investigation Into Enhanced Selenium Bioaccumulation in Benthic Invertebrate Tissue in Erickson Creek (Teck 2023a). This report explores potential contributing factors to increase BIT Se concentrations in Upper Erickson Creek and monitoring is on-going as of the date of this report.

Overall, the data gathered indicated that fine grained particulates (i.e., iron and manganese oxides), derived from SRF operation, are increasing Se bioaccumulation in BIT in upper Erickson Creek. Sediments collected in upper Erickson Creek below the SRF outfall show an increase in both total and bioavailable Se species at the same temporal scales as the observed BIT Se concentration increase. The enhanced sediment Se concentrations are only observed in the upper reaches of Erickson Creek and show no significant increase at the confluence with Michel Creek or in Michel Creek.

Water treatment of Erickson Creek was paused in early April 2022 for planned maintenance and extended as an adaptive management response to mitigate further increases in BIT Se concentrations during the investigation of cause. Shortly after treatment was paused, BIT Se concentrations decreased in upper Erickson and reached pre-SRF concentrations by October 2022. The SRF was restarted on October 4, and in November and December of 2022 mean BIT Se concentrations remained below EVWQP Level 1 benchmarks for benthic invertebrate tissue.

To reduce particle loading from the EVO SRF to Erickson Creek, Teck is advancing design and implementation of a temporary particle control (filtration) full scale trial. This has been informed by the results learned to date in Erickson Creek and has potential application to other SRF systems coming online in 2023. While filtration is understood to be an interim mitigation, based on our current understanding of the causal mechanism, it may not be the final mitigation for the EVO SRF (or other SRFs). Other mitigation strategies (e.g., flow rates, discharge pathways, SRF process adjustments, alternative filtration/removal technologies) that may also reduce or mitigate particle release into the receiving environment are being considered for application at EVO SRF and other SRFs, as appropriate.

5 UPDATES TO 2021 TO 2023 EVO LAEMP STUDY DESIGN

Permit 107517 (last amended May 18, 2023) contains Section 8.3.4 which outlines the LAEMP requirements for any changes to the approved 2021 to 2023 study design as follows:

“Section 8.3.4: The permittee must develop and implement a LAEMP to determine the magnitude and extent of influence from EVO SRF discharge on water quality (including temperature), calcite and benthic invertebrate communities to assess what factors are contributing to the observed effects. The study design must be reviewed by the EMC and submitted to the director for approval by June 30, 2021. The LAEMP must be designed to an appropriate temporal scale to capture short term, local effects to the immediate receiving environment, and must consider the possibility of impacts resulting from potential selenium speciation. The LAEMP must focus on Erickson Creek from EV_ECOUT (E321814) to EV_EC1 (0200097) and Michel Creek between EV_MC3 (0200203) and EV_MC2 (E300091) for 2021-2023.

Until the 2021-2023 LAEMP study design is approved and implemented, the permittee must continue the pre-operational aquatic effects monitoring program as outlined in Section 8.2.2 the EVO SRF Phase 2 Operations application. The permittee must notify the director at least 15 days prior to implementing any proposed changes to the approved LAEMP. Any changes to the approved study design must be reported in the annual LAEMP report.”

The EVO LAEMP Study Design was reviewed by the EMC and submitted June 30, 2021, in accordance with section 8.3.4. Sampling conducted in 2023 will follow the approved study design with one exception.

Lower Erickson Creek (Reach 1, 290 m, stretching from the confluence of the Michel Creek to above RG_ERCK) is slated for calcite remediation and the lower 50 to 70 m will be remediated in September of 2023. Due to the instream works it will likely be impossible to sample RG_ERCK in September 2023. If sampling is not possible at RG_ERCK alternative samples will be collected at RG_ERCK2, a newly established monitoring area located approximately 200 to 250 meters upstream of the confluence of Erickson and Michel creeks.

A1 PHYSICAL HABITAT

A1.1 Temperature

A1.1.1 Sample Collection

To evaluate potential temperature-related effects associated with the SRF discharge, instream continuous data loggers (TidbiT v2 Temp [UtBI-001]) were deployed at six locations (RG_ERCKUT, RG_ERCKDT, EV_EC_FLOW3, EV_EC_FLOW2, EV_EC_FLOW1, and RG_ERCK) in Erickson Creek in December 2020 (Figure 1.4; Table 2.4). Temperature data from these loggers was downloaded three times in 2021 (April, June, and October/November). Loggers were deployed in sets of two¹ to confirm logger accuracy and for contingency purposes. Two additional temperature loggers were installed at RG_ERCKUT and RG_ERCK on June 29th, 2021. The additional logger at RG_ERCKUT was installed to better understand temperature gradient upstream of the SRF, while the additional logger at RG_ERCK was added for contingency purposes due to the high calcification in the area, a lack of structures to anchor temperature loggers, as well as substantial flows in the area during freshet. Data from previously established temperature loggers monitored by Teck at F2_ECF (SRF effluent), EV_ECOUT (RG_ERCKDT), and EV_EC1 (RG_ERCK) were also included. Temperature loggers were downloaded onto a base station and uploaded to a computer for analysis. Following download, the loggers were placed back at the same depth for continued monitoring.

A1.1.2 Data Analysis

Temperature data from Teck routine water monitoring in fish-bearing areas of Erickson Creek (EV_EC1 [RG_ERCK]), were evaluated relative to British Columbia water quality guidelines². British Columbia water temperature guidelines for bull trout and westslope cutthroat trout specify a maximum ± 1 °C change from the optimum temperature range for different life stages of these species (spawning, incubation, and rearing; BCMOE 2001). Dissolved oxygen guidelines are also specific to life stage (buried embryo/alevin and all other life stages; BCMOE 1997). Guidelines for both these parameters were applied to periods of the year relevant to the specific life stage of each of the two species, with the time periods approximated from available literature (McPhail and Baxter 1996; McPhail 2007; COSEWIC 2016).

¹ The replicate logger at RG_ERCK was lost during collection on June 3rd, 2021.

² Air temperature at these areas was also considered in the interpretation of water temperature results.

Maximum daily temperature from temperature loggers at EV_EC1 (RG_ERCK) were compared directly to the SPO (which is based largely on the optimum temperatures for fish noted above) per Permit 107517³. Tabulated maximum daily temperature values via routine Teck monitoring in relation to the SPO was performed in Microsoft Excel and plots of temperature logger data were generated using R (R Core Team 2022).

A1.2 Sediment

A1.2.1 Sample Collection

Sediment quality samples were collected concurrently with benthic invertebrate sampling in September 2022. Three replicate sediment samples from both reference areas (RG_ALUSM and RG_MI25) were collected, while five replicate sediment samples were collected immediately upstream (RG_ERCKUT) and downstream of the SRF outfall (RG_ERCKDT) in Erickson Creek as well as at the compliance point in Michel Creek (RG_MICOMP; Figure 1.3; Table 2.2). Sediment samples were also collected at RG_MI3 (n=4), RG_ERCK (n=5), and RG_MIDER (n=5) as part of the 2021 to 2023 RAEMP study design (Minnow 2021a). Additional samples were collected monthly in Erickson Creek from March to December 2022, when sediment was present (Table 2.3). Surficial sediment was collected by slowly and carefully placing the spoon on the sediment surface in a manner that minimized disturbance and inserting the spoon into the sediment to capture sediment to a depth of 1 to 2 cm. Samples were collected into glass jars for analysis of polycyclic aromatic hydrocarbons (PAHs) and into polyethylene bags for analysis of metals, moisture content, and particle size distribution. Five sediment samples were collected at each mine-exposed area and three samples were collected in each reference area, consistent with the previous RAEMP cycle (Minnow 2020). Duplicate QC samples (split samples) were collected in the field concurrent with sediment chemistry samples at a rate of 10%. Following collection, samples were placed in a refrigerator at approximately 4°C until submitted to a qualified laboratory (ALS Calgary) for analysis.

A1.2.2 Laboratory Analysis

Sediment samples were analyzed by ALS Environmental in Calgary, Alberta. The laboratory thoroughly homogenized each sample prior to analysis. Methods used were consistent with the British Columbia Environmental Laboratory Manual (BCMOECCS 2020), where applicable,

³ The SPOs for temperature per Permit 107517 went into effect on August 13, 2021. The SPO at EV_EC1 (RG_ERCK) from January 1 to April 30 and November 1 to December 31 is <7°C, while from May 1 to August 31 it is <13°C, and September 1 to October 31 it is <10°C.

and include analyses of physical and chemical parameters (e.g., moisture content, particle size, total organic carbon [TOC], metals and metalloids, and PAHs).

Sediment samples were analyzed for the following constituents:

- Physical tests (moisture and pH);
- particle size and type (clay, grain size curve, silt, sand, gravel);
- Inorganic carbon, total carbon, total organic carbon, inorganic carbon (IC; as CaCO₃ equivalent);
- metals (aluminum, antimony, arsenic, barium, beryllium, bismuth, boron, cadmium, calcium, chromium, cobalt, copper, iron, lead, lithium, magnesium, manganese, mercury, molybdenum, nickel, phosphorus, potassium, selenium, silver, sodium, strontium, sulfur, thallium, tin, titanium, tungsten, uranium, vanadium, zinc, zirconium);
- polycyclic aromatic hydrocarbons (acenaphthene, acenaphthylene, acridine, anthracene, benz(a)anthracene, benzo(a)pyrene, benzo(b+j)fluoranthene, benzo(b+j+k)fluoranthene, benzo(g,h,i)perylene, benzo(k)fluoranthene, chrysene, dibenz(a,h)anthracene, fluoranthene, fluorene, indeno(1,2,3-c,d)pyrene, methyl naphthalene, 1+2-, methyl naphthalene, 1-, methyl naphthalene, 2-, naphthalene, phenanthrene, pyrene, quinoline, B(a)P total potency equivalents [B(a)P TPE], IACR (CCME), IACR AB (coarse), IACR AB (fine), PAHs, total (BC Sched 3.4), PAHs, total (EPA 16);
- polycyclic aromatic hydrocarbons surrogates (acridine-d₉, chrysene-d₁₂, naphthalene-d₈, phenanthrene-d₁₀).

Upon completion of the laboratory analyses, data reports were provided to Minnow and Teck electronically as Adobe Acrobat PDF and Microsoft Excel files.

Sediment samples were analyzed using the following methods:

- Moisture content was determined gravimetrically by drying the sample at 105°C;
- particle size distribution was determined by dry sieving (coarse particles), wet sieving (sand), and the pipette sedimentation method (fine particles);
- metals by Collision Reaction Cell Inductively Coupled Plasma-Mass Spectrometry (CRC ICP-MS; EPA 200.2/6020A);
- mercury by Cold Vapour Atomic Fluorescence Spectroscopy (CVAFS; EPA 200.2/245.7);
- TOC by combustion method (Carter and Gregorich 2008); and

- PAHs by rotary extraction using hexane/acetone (EPA 3570/8270) followed by capillary column gas chromatography with mass spectrometric detection (GC/MS).

Sediment chemistry data collected for the 2022 EVO LAEMP were of acceptable quality as characterized by appropriate LRLs, good detectability, excellent laboratory precision and accuracy, excellent field precision and reproducibility, and few hold time exceedances (Appendix B). Overall, the associated data were considered acceptable for this study.

A1.2.3 Data Analysis

Sediment quality data were tabulated, summarized, and compared to British Columbia Working Sediment Quality Guidelines (WSQGs), except for selenium concentrations which were compared to an alert concentration considered equivalent to an upper WSQG (BCMOECCS 2019, 2021a,b). The sediment data were also compared to reference area normal ranges, which were the 2.5th and 97.5th percentiles of pooled reference area distribution after removal of outliers (Minnow 2021c). Normal ranges could not be calculated for several PAHs because most of the values were below laboratory reporting limits (LRL). Data from 2017 to 2021 were plotted for all constituents for which a WSQG was available and visually assessed for temporal changes.

Temporal changes in sediment chemistry were evaluated relative to the commissioning of water treatment in December of 2021. Specifically, a censored analysis of variance (ANOVA) was conducted to compare differences in selenium concentrations between the station immediately upstream (RG_ERCKUT) and immediately downstream (RG_ERCKUT). Additional comparisons were made upstream (RG_MI3) and downstream (RG_MIDER) of Erickson Creek in Michel Creek as well as between additional areas in Michel Creek. Where there were significant differences a magnitude of difference (MOD) for each year comparison was calculated as:

$$MOD = \frac{MCT_{Treated, After} - MCT_{Predicted, After}}{MCT_{Predicted, After}} \times 100\%$$

; where:

$$MCT_{Predicted, After} = MCT_{Untreated, After} + (MCT_{Treated, Before} - MCT_{Untreated, Before});$$

and the measures of central tendency (MCT) are the estimated marginal means from the full ANOVA model. The MOD captures the change in concentrations at the treated station relative to what was expected given the differences pre-treatment. Calcite

A1.2.4 Calcite Measurement

Measurements of calcite presence and concretion were conducted on 100 particles (pebbles) at each biological sampling location concurrent with (and using the same particles as) the 100-pebble count. Calcite presence (C_p) has historically been a binary assessment (i.e., presence [score = 1] or absence [score = 0]; Teck 2016, Lotic 2021). In 2021, an additional method for assessing calcite presence in lotic environments was included (C_p' , Lotic 2021, Zathay et al. 2021, Robinson et al. 2022) that scored the fraction of the particle surface area covered by calcite as a decimal to the nearest 10th percentile (0.1, 0.2, 0.3, etc.; see Appendix C). The degree of concretion (C_c) was assessed by determining if the particle was removed with negligible resistance (not concreted; score = 0), noticeable resistance but removable (partially concreted; score = 1), or immovable (fully concreted; score = 2). If distinct particles were not visible due to heavy calcification, values of 1 (for presence) and 2 (for concretion) were recorded. If fines were encountered and calcite presence could not be visually confirmed, values of 0 (for presence) and 0 (for concretion) were recorded. If rocks were visible under fine material, the rock was selected for calcite measurements.

A1.2.5 Data Analysis

The results for the 100 particles were expressed as a Calcite Index (CI and CI') based on the following equations (Lotic 2021, Zathay et al. 2021, Robinson et al. 2022):

$$CI = C_p + C_c \text{ or } CI = C_p' + C_c$$

Where:

CI or CI' = Calcite Index⁴

$$C_p = \text{Calcite Presence Score} = \frac{\text{Number of particles with calcite}}{100 \text{ (binary score)}}$$

$$C_p' = \text{Calcite Presence Score} = \frac{\text{Number of particles with calcite}}{100 \text{ (proportional score)}}$$

$$C_c = \text{Calcite Concretion Score} = \frac{\text{Sum of particle concretion scores}}{100}$$

Calcite data collected as part of the Regional Calcite Monitoring Program (Lotic 2022) were reported but were not used in analyses as the calcite measurements taken concurrently

⁴ CI refers to the binary assessment of C_p and CI' refers to the proportional assessment of C_p' .

with biological sampling were deemed more appropriate because they are representative of the areas sampled for benthic invertebrates (i.e., riffles).

A2 WATER QUALITY

A2.1 Sample Collection

One water sample was collected concurrently with biological monitoring and included analysis of constituents stipulated in Permit 107517 (Appendix Table A.1), as well as selenium speciation. Sample collection procedures were consistent with those outlined in the British Columbia Field Sampling Manual (Province of British Columbia 2013). *In situ* measurements of temperature, dissolved oxygen (DO), pH, and specific conductance were recorded concurrently with biological monitoring. The water quality meter used to collect *in situ* measurements was calibrated regularly and maintained according to manufacturer instructions.

Water samples were collected far enough upstream or downstream of confluences (tributaries, discharges) to avoid areas of incomplete mixing (lateral, vertical), and upstream from bridges or other structures to avoid the potential for associated influence.

Water samples were collected by wading into a mid-channel area (unless it was not practical or safe to do so), moving from downstream to upstream, to avoid collection of water downstream of disturbed substrates. Samples were collected from mid-depth by inverting sample bottles below the surface before they were taken to shore prior to the addition of applicable preservatives. Water samples being analyzed for dissolved constituents were filtered in the field using a clean syringe affixed with a 0.45- μm membrane. Once filtered, the sample was preserved immediately in the manner specified by the analytical laboratory. Station location (i.e., GPS coordinates), date, time, and identifier were recorded on field sheets. All samples were kept at $\sim 4^{\circ}\text{C}$ until analysis. Samples were shipped to the analytical laboratory daily or every other day to achieve compliance with recommended analytical hold times.

Quality assurance and quality control (QA/QC) samples were collected in the field concurrent with water samples. A minimum of one water chemistry duplicate, one field blank, and one trip blank were collected for every 10 samples (10%).

A2.2 Laboratory Analysis

Water quality samples were analyzed by a qualified third-party Canadian Association for Laboratory Accreditation Inc. (CALA)-certified laboratory (ALS Environmental) for constituents listed in Permit 107517 (Appendix Table A.1). Analysis of selenium species was performed by a qualified third-party laboratory (Brooks Applied Labs, Seattle, WA). Methods were consistent

with the British Columbia Environmental Laboratory Manual (Province of British Columbia 2016), where applicable.

Water samples were analyzed by ALS Environmental (ALS; Calgary, AB) for constituents consistent with Permit 107517 (i.e., conventional constituents, major ions, nutrients, and total and dissolved metals; Appendix Table A.1) using the following methods indicated in parentheses:

- total organic carbon (TOC) and dissolved organic carbon (DOC; combustion method; American Public Health Association [APHA] 5310 for TOC);
- Total suspended solids (TSS) and total dissolved solids (TDS; gravimetric method; APHA 2540 D and C for TSS and TDS, respectively);
- alkalinity (potentiometric titration; APHA 2320);
- turbidity (nephelometric method; APHA 2130 Turbidity);
- hardness, as CaCO_3 (by calculation; APHA 2340 B);
- total and dissolved metals⁶, (collision cell inductively coupled plasma - mass spectrometry and inductively coupled plasma - optical emission spectrophotometry; APHA 3030 B&E/ Environmental Protection Agency [EPA] SW-846 6020A, and EPA 3005A/6010B, respectively);
- bromide, chloride, fluoride, and sulphate (ion chromatography; APHA 4110 B);
- ammonia, as N (fluorescence; J. Env. Monit., 2005, 7:37-42);
- nitrate and nitrite, as N (ion chromatography; EPA 300.0);
- total Kjeldahl nitrogen (TKN) (fluorescence; APHA 4500-NORG D.);
- orthophosphate and total phosphorus (colourimetric method; APHA 4500-P Phosphorus); and
- DMSeO, MeSe(IV), MeSe(VI), Se(IV), Se(VI), SeCN, SeMet, SeSO₃, unknown Se Sp, total Se and Dissolved Se.

Selenium speciation analysis was conducted by Brooks Applied Labs (Bothell, Washington) using ion chromatography inductively coupled plasma collision reaction cell mass spectrometry (ICICPCRC-MS). Constituents included selenate, selenite, dimethylselenoxide, methylseleninic acid, methaneselenonic acid, selenocyanate, selenomethionine, selenosulphate, and unknown selenium species. Selenium species were first separated on an

ion exchange column and then detected using a collision/reaction cell-equipped inductively coupled plasma mass spectrophotometry (ICP-MS). The applied method was optimized to provide interference free quantitation of individual selenium species at part-per-trillion (ppt) levels. Total (unfiltered) and dissolved (filtered) selenium analyses were also performed by Brooks Applied Labs using inductively coupled plasma triple quadrupole mass spectrometry (ICP-QQQ-MS). Water samples were collected into borosilicate glass containers and preserved to a pH < 2 with nitric acid. An aliquot of each preserved sample was further digested with nitric and hydrochloric acids in a closed vessel (bomb) prior to analysis. The applied sample collection, preservation, digestion, and analytical procedures are designed to accurately quantify selenium in the presence of potential interferences (e.g., chloride and bromide) and regardless of the chemical form of selenium present in solution (e.g., ionic, particulate, or volatile molecular forms).

Water chemistry data collected for the 2022 EVO LAEMP were of acceptable quality as characterized by good detectability, appropriate LRLs, minimal evidence of laboratory or field contamination, good laboratory and field precision and accuracy, and few hold time exceedances (Appendix A). Overall, the associated water chemistry data from ALS and BAL can be used with a high level of confidence in the derivation of conclusions.

A2.3 Data Analysis

Water quality assessment focused on constituents with early warning triggers (EWTs) as defined under the AMP (Azimuth 2018) as well as other constituents required to assess study questions. Total mercury was not included as the source of aqueous mercury concentrations in the Elk Valley is not considered mining (Teck 2019). Total phosphorus and orthophosphate were included in water quality assessment to assess productivity relative to water treatment. Data extracted from Teck's EQUIS database were screened for text values and converted to a common unit.

Routine water quality monitoring results were screened against British Columbia Water Quality Guidelines (BCWQG; BCMOEECS 2019, 2021a,b) as part of Teck's Annual Water Quality Monitoring Report under Permit 107517 (Teck 2022). Water samples taken concurrently with biological monitoring samples were integrated with routine water quality monitoring stations for a more complete data set. Routine water quality monitoring stations were matched with concurrent water samples according to proximity (Table 2.4). Water quality constituents were compared to BCWQGs (BCMOEECS 2019, 2021a,b), EVWQP benchmarks (Teck 2014), updated effects concentrations (i.e., for nitrate and sulphate), screening values for TDS, and the proposed benchmark for dissolved nickel, as applicable, for the 2022 calendar year. Plots of constituents with EWTs under the AMP (i.e., TDS, sulphate, total

concentrations of antimony, barium, boron, lithium, manganese, molybdenum, nickel, selenium, uranium, and zinc, and dissolved concentrations of cadmium and cobalt; Azimuth 2018), nutrients, and selenium species from 2012 to 2022 were plotted individually for each monitoring station.

Preparation of the 2014 Elk Valley Water Quality Plan (EVWQP) required derivation of science-based benchmarks for nitrate, sulphate, cadmium, and selenium. Risks associated with these constituents depend on their concentrations, concentrations of other water chemistry parameters known as exposure and toxicity modifying factors (ETMFs), and the sensitivity of aquatic receptors that could be exposed. The EVWQP benchmarks were derived, using a large body of published and site-specific information available at that time, to represent scientific best estimates of concentrations associated with no effects and defined levels of potential effect on chronic, sublethal endpoints for sensitive aquatic species. Margins of safety were incorporated in benchmark derivation to account for uncertainty and Teck committed to undertaking further study and periodic updates to progressively reduce that uncertainty and improve confidence in the benchmarks.

Studies conducted to progressively reduce uncertainty in benchmarks have included additional chronic toxicity studies of nitrate, sulphate, cadmium, and selenium individually and in mixtures, annual evaluation of water quality under the regional chronic toxicity monitoring program, updates to selenium bioaccumulation models in 2017 and 2022, development of new tools to predict bioaccumulation in relation to selenium speciation, and most recently an extensive program of validation and updates to the science-based benchmarks under Teck's Adaptive Management Plan (AMP). This program was undertaken to answer Management Question (MQ) 2 under the AMP: Will the aquatic ecosystem be protected by meeting the long-term site performance objectives? and associated key uncertainty 2.1: How will the science based benchmarks be validated and updated? The MQ2 program was developed with input from the Elk Valley Environmental Monitoring Committee (EMC) and results have been shared with the EMC on an ongoing basis since the program began.

A key outcome of the MQ2 program was the development of an updated compilation of chronic toxicity information for nitrate, sulphate, and selenium, including information available at the time of the EVWQP and studies conducted after the EVWQP. For nitrate and sulphate, the updated compilation represented a substantial increase in available toxicity information for key test species. This updated compilation was used to validate the EVWQP benchmarks and, where warranted, to derive updated effects concentrations that incorporate this new information (WSP Golder 2022). As in the EVWQP, the objective was to derive scientific best estimates of concentrations associated with no effects or defined levels of potential chronic,

sublethal effect to sensitive species and life stages relevant to the Elk Valley. The analysis in WSP (2022) concluded that the updated effects concentrations for nitrate and sulphate are supported by a larger dataset covering a wider range of conditions than was available at the time of the EVWQP, and thereby provide an improved basis for evaluating potential effects of these constituents.

Potential changes in water quality constituents at individual stations were analyzed statistically to evaluate (1) if there was an increase or decrease since the base year of monitoring (2012 or the earliest year if monitoring was initiated post-2012), (2) whether the annual mean was within the range of historical annual means, and (3) if the current monitoring year (2022) was different from the previous monitoring year (2021).

Monthly mean concentrations of each constituent were estimated using the Kaplan-Meier (K-M) method. The method involves transforming the left censored (i.e., < value) data set to a right censored (i.e., > value) data set, and then using the K-M estimator (used to estimate the mean survival time in survival analysis) to estimate the mean. The calculation was conducted using the `survfit()` function in the survival package (Therneau 2017) in R and involves calculating the area under the K-M survival curve. The K-M method is non-parametric and can accommodate multiple LRLs. The method of estimating the mean is equivalent to using the distribution of detectable values below the LRL to represent values that are < LRL. For example, the mean of the data set {1, 2, <4, 5} is estimated as the mean of 1, 2, [$\frac{1}{2} \times 1 + \frac{1}{2} \times 2$], and 5 which is 2.375. The value <4 is replaced by the distribution of values below 4 (i.e., 1 and 2 with equal weight of $\frac{1}{2}$). Similarly, the mean of the data set {1, 1.6, 2, 2.1, <4, 5} is estimated as the mean of 1, 1.6, 2, 2.1, [$\frac{1}{4} \times 1 + \frac{1}{4} \times 1.6 + \frac{1}{4} \times 2 + \frac{1}{4} \times 2.1$], and 5 which is 2.229. Again, the value <4 is replaced by the distribution of values below 4 (i.e., 1, 1.6, 2, and 2.1 with equal weight of $\frac{1}{4}$). If there is only one LRL and no detected values below the LRL, then the K-M estimate of the mean is equivalent to replacing the value below the LRL with the LRL (i.e., the best estimate for the values < LRL is the LRL).

Temporal changes in monthly mean concentrations for water quality constituents were evaluated for each station (reference and mine-exposed) from 2012 to 2022. Only years with at least six months and only stations with at least three years of data were included in the analysis. Because of the presence of LRLs for most parameters, a censored regression analysis of variance (ANOVA) model with factors *Year* and *Month* and assuming a log-normal distribution of the response variable was fit with maximum likelihood estimation for each station. The significance of each term in the model was assessed using likelihood-ratio tests to determine if there is a significant change in log-likelihood with the addition of the term in the model. This tested for an overall difference among years (including the *Month* term in

the model controlled for seasonal effects within a year). If the Year term was significant ($\alpha = 0.05$) then post-hoc contrasts were conducted to test for pairwise differences among years with an $\alpha = 0.05$ in a Tukey's HSD test which corrects for the number of comparisons.

For each year, a percent magnitude of difference from the base year (i.e., first year with minimum number of months) was calculated as:

$$\frac{Year_i - Base Year}{Base Year} \times 100 \%$$

and the significant difference between 2022 and previous years was assessed.

Tests for temporal trends were also conducted using the non-parametric seasonal Kendall test described by Hirsch et al. (1982). The tests were conducted using scripts written in R software (R Core Team 2022). The seasonal Kendall test assesses temporal trends separately for each season (or month in this case) and combines the results for each season into an overall test for trend. The test is non-parametric and assesses whether there is a monotonic increasing or monotonic decreasing trend over time. The test is conducted by calculating the test statistic S_i which is equal to the sum of the number of increases and decreases from a time period t to all time periods after t for each observation in season i . The overall test statistic S is computed as the sum of S_i for all seasons. The significance of the observed S is determined by comparing it to a critical value of S (at the significance level $\alpha = 0.05$) determined from the exact sampling distribution of S (calculated by determining all possible permutations and combinations of S based on the increases and decreases from the number of pairwise comparisons made; Hirsch et al. 1982). If more than 45 pairwise comparisons are made (equivalent to the number of pairwise comparisons for $n = 10$ in a single season), then the normal approximation is used to calculate a p-value and to assess significance (Hirsch et al. 1982). The standard normal deviate Z is calculated as:

$$Z = \begin{cases} \frac{S - 1}{\sqrt{\sigma_S}} & \text{if } S > 0 \\ 0 & \text{if } S = 0 \\ \frac{S + 1}{\sqrt{\sigma_S}} & \text{if } S < 0 \end{cases}$$

Where $\sigma_S = \sum_{i=1}^k \frac{n_i(n_i-1)(2n_i+5) - \sum T_i t_i(t_i-1)(2t_i+5)}{18}$ and n_i is the number of samples in month i , t_i is the number of tied values for each tied value T_i , and k is the number of seasons (Hirsch et al. 1982).

An estimate of the trend slope over time was estimated by computing the median of all slopes between data pairs within the same month (Helsel and Hirsch 2002). The slope was reported as a percentage change in concentration per year. The intercept of a line through the time series was estimated as the median intercept of all lines through each point with the estimated slope (Pohlert 2016). The trend analysis was only conducted with a minimum number of 5 pairwise comparisons, the minimum number required for all consecutive increases or decrease to be significant at $\alpha = 0.05$.

Potential temporal changes in constituents with EWTs, nutrients (total phosphorus and orthophosphate) and selenium speciation were also evaluated relative to the commissioning of the EVO SRF. Specifically, a censored analysis of variance (ANOVA) was conducted to compare differences in concentrations between the station immediately upstream (RG_ERCKUT) and immediately downstream (RG_ERCKDT). Additional comparisons were made upstream (RG_MI3) and downstream (RG_MIDER) of Erickson Creek in Michel Creek as well as between additional areas in Michel Creek.

Seasonal mean concentrations of order constituents (nitrate, total selenium, dissolved cadmium, and sulphate) and total nickel from 2022 were plotted spatially, while selenium species concentrations of samples taken concurrent with biological monitoring in 2022 were also plotted spatially.

A2.4 Acute Toxicity Testing

Aqueous chronic toxicity was monitored, analyzed, and interpreted under the Annual Water Quality Monitoring Program (Teck 2023). Two acute toxicity tests were conducted on a quarterly basis as part of the Annual Water Quality Monitoring Program (as per Permit 107517):

- Single concentration acute toxicity test (96-hour LC50) using rainbow trout (*Oncorhynchus mykiss*); universal method: EPS 1/RM/9 (Environment Canada 2007a); and
- Single concentration acute toxicity test (48-hour LC50) using *Daphnia* spp.; universal method: EPS 1/RM/11 (Environment Canada 1996).

A2.5 Chronic Toxicity Testing

The following chronic toxicity tests were completed quarterly or semi-annually for water samples collected at mine-exposed and reference sites, as per the Permit 107517 Chronic Toxicity Program:

- 72-hour growth/inhibition test using a freshwater alga (*Pseudokirchneriella subcapitata*) conducted quarterly using method: EPS1/RM/25; Environment Canada 2007a;
- 7-day test of reproduction and survival using the cladoceran, *Ceriodaphnia dubia* conducted quarterly using method: EPS1/RM/21; Environment Canada 2007b;
- 28-day water-only test of growth and survival using the amphipod, *Hyalella azteca* conducted semi-annually (in Q2 and Q4) using methods adapted from USEPA (2000);
- 30-day early life stage toxicity tests using rainbow trout, *Oncorhynchus mykiss* conducted semi-annually (in Q2 and Q4) using method: EPS 1/RM/28- 1E; Environment Canada 1998; and
- 28-day early life stage toxicity test using fathead minnow, *Pimephales promelas* conducted semi-annually (in Q1 and Q3) using methods: EPA-712-C-96-121; USEPA 1998; and E1241-05; ASTM 2013.

Toxicity tests and associated QA/QC measures were completed by a qualified third-party biological testing laboratory. Water quality samples were collected at the same time to support evaluation of toxicity test results. Results were reported quarterly and summarized annually by Teck in accordance with Permit 107517 requirements.

A3 BENTHIC INVERTEBRATES

A3.1 Overview

Benthic invertebrates are an important component of the aquatic ecosystem of the Elk River watershed because they can be used as indicators of localized food availability (based on abundance), food quality (based on tissue chemistry) and habitat quality (based on richness, % Ephemeroptera, Plecoptera and Trichoptera [EPT], and % Ephemeroptera, as well as abundance of EPT and Ephemeroptera, Plecoptera, and Trichoptera individually) for receptors at higher trophic levels. Benthic invertebrate monitoring in the EVO LAEMP consisted of community sampling, productivity, and composite-taxa tissue chemistry sampling. Supporting measures, including habitat characterization, were also collected concurrent with benthic invertebrate community samples, as described below.

Benthic invertebrate samples were collected to address study questions related to community structure (as determined via CABIN sampling; Section A3.2), productivity (as determined via Hess sampling; Section A3.3), and invertebrate tissue accumulation of selenium (Section A3.4). Consistent with other LAEMPs and the RAEMP (Minnow 2021a,b,c Minnow and Lotic 2021b), benthic invertebrate community and productivity sampling was completed in September; however, benthic invertebrate tissue sampling occurred monthly from March to December of 2022 (Table 2.2 and 2.3). Individual water samples for routine water quality analysis and selenium speciation analysis were collected from each monitoring area during each sampling event, concurrently with the collection of biological samples.

A3.2 Community Structure

A3.2.1 Sample Collection – Canadian Aquatic Biomonitoring Network (CABIN)

Benthic invertebrate community sampling followed the CABIN protocol, which involved a 3-minute travelling kick into a net with a triangular aperture measuring 36 cm per side and a mesh having 400-µm openings (Environment Canada 2012a). During sampling, the field technician moved across the stream channel (from bank to bank, depending on stream depth and width) in an upstream direction. With the net held immediately downstream of the technician's feet, the detritus and invertebrates disturbed from the substrate passively collected in the kick-net by the stream current. After three minutes of sampling time, the sampler returned to the stream bank with the sample. The kick-net was rinsed with water to move debris and invertebrates into the collection cup at the bottom of the net. The collection

cup was then removed, and the contents poured into a labelled plastic jar and preserved to a concentration of 10% buffered formalin solution in water.

A3.2.2 Laboratory Analysis

Benthic invertebrate community samples were sent to Cordillera Consulting (lead taxonomist Scott Finlayson), in Summerland BC, for sorting and taxonomic identification. Taxonomists at Cordillera have achieved certification for Group 1 (general Arthropods West), 2 (EPT East and West), and 3 (Chironomids West) benthic organisms in the Taxonomic Certification Program of the Society for Freshwater Science. At the beginning of the sorting process, each sample was examined and evaluated for estimation of total invertebrate numbers. If the total number was estimated to be greater than 600, then the laboratory's sub-sampling protocol was followed. Sorting efficiency and sub-sampling accuracy and precision was quantified using methods specified by Environment Canada (2014). Organisms were identified to the lowest practical level (LPL; typically genus or species).

Benthic invertebrate community data collected for the present study were of excellent quality as characterized by excellent sorting efficiency and excellent taxonomic identification accuracy (Appendix A). Therefore, the associated data can be used with a high level of confidence in the derivation of conclusions.

A3.2.3 Supporting Measures

Consistent with the requirements of the CABIN sampling protocol, supporting habitat information (i.e., water velocity and depth, *in situ* water quality [temperature, dissolved oxygen [DO], conductivity, pH], and substrate characteristics [Wolman 100-pebble count and substrate embeddedness]) were collected concurrently with BIC sampled in riffle habitats (Environment Canada 2012a). Periphyton scores were also ascribed to each biological monitoring area during September sampling, and according to CABIN sampling protocol (Environment Canada 2012a, Minnow and Lotic 2021b). The scoring was ascribed as follows:

- 1 – rocks not slippery, no obvious colour (<0.5mm thick);
- 2 – rocks slightly slippery, yellow-brown to light green in colour (0.5-1mm thick);
- 3 – rocks have noticeable slippery feel, patches of thicker green to brown algae (1-5mm thick);
- 4 – rocks are very slippery, numerous clumps (5-20mm thick); and
- 5 – rocks mostly obscured by algae mat, may have long strands (>20mm thick).

A3.2.4 Data Analysis

To address the investigation into the changes in BIC structure, endpoints of total sample abundance, richness (LPL taxonomy), percent (%) and total abundance of Chironomidae, EPT, Ephemeroptera, Plecoptera, and Trichoptera individually, and total abundance of key Ephemeroptera families (Baetidae, Heptageniidae, Ephemerellidae) were plotted spatially and temporally. Autotrophic to Heterotrophic Index, Shredder Index, Filtering to Collector Index, Predator Index, and Hyporheic to Benthic Index were also computed for each biological monitoring area from CABIN kick samples and using the following equations:

$$\text{Autotrophic to Heterotrophic Index} = \log_{10} \left(\frac{\text{Scrapers}}{\text{Shredders} + \text{Collector Gatherers} + \text{Filterers}} \right)$$

$$\text{Filtering Collector Index} = \log_{10} \left(\frac{\text{Filterers}}{\text{Collector Gatherers}} \right)$$

$$\text{Predator Index} = \log_{10} \left(\frac{\text{Predators}}{\text{All other Feeding Groups}} \right)$$

$$\text{Hyporheic to Benthic Index} = \log_{10} \left(\frac{\text{Burrowers}}{\text{Clingers} + \text{Sprawlers}} \right)$$

$$\text{Shredder Index} = \log_{10} \left(\frac{\text{Shredders}}{\text{Collector Gatherers} + \text{Filterers}} \right)$$

Benthic invertebrate community data collected in September were compared to regional normal (reference area) ranges and habitat adjusted site-specific normal ranges. The regional normal range is defined as the 2.5th and 97.5th percentiles of the distribution of reference area data (pooled 2012 to 2019 data) reported in the 2017 to 2019 RAEMP report (Minnow 2020). The site-specific normal ranges were calculated as prediction intervals from the final habitat model (Minnow 2020). Ninety-fifth percentile prediction intervals were calculated from linear mixed-effects models using simulations (n=100,000) to generate residual variation in random-effects terms. For Ephemeroptera and EPT Abundance endpoints, the prediction intervals from the % Ephemeroptera and % EPT models were multiplied by the prediction intervals from the Abundance model to generate the taxa specific abundance predictions. Prediction intervals were calculated using the predictInterval() function in the merTools R package (Knowles and Frederick, 2019). The residuals from the habitat models (observed minus model predicted values; on the transformed scale) were used in correlation analyses below.

Endpoints from September were plotted spatially (2022), and temporally (2012 to 2022) for each area where data were available. The relative composition of BIC was plotted spatially by monitoring area where samples were collected in 2022.

Temporal changes in benthic endpoints calculated from September kick and sweep data were evaluated for 2012 to 2022. For some (but not all) years there were replicate data for a given area within a year. Thus, for each endpoint, an ANOVA with factors *Year*, *Area* and *Year × Area* was fit. The best transformation for each endpoint was chosen as the transformation for which a Shapiro-Wilk's test on the residuals gave the highest P-value (i.e., most normally distributed). If there was a significant *Year* term, the variability within years and areas from the full model was used to test for significant differences between all pairwise comparisons of year for each area (i.e., is the difference between year *i* and year *j* greater than would be expected given the variability within areas for all stations for which we have replicates). This assumes the variability to be consistent among areas and years but allows for comparisons between years without replicates. Significance of the pairwise comparisons was assessed with an α of 0.05 in a Tukey's Honestly Significant Difference test (HSD) which corrects for the number of comparisons.

For each year, a magnitude of difference from the base year (i.e., first year with data) was calculated as:

$$\frac{Year_i - Base Year}{Pooled SD}$$

and the significant differences between 2022 and previous years was assessed. All statistics were conducted in R (R Core Team 2021).

Temporal changes in BIC endpoints were also evaluated relative to the commissioning of the EVO SRF. Specifically, an Analysis of Variance (ANOVA) was conducted to compare differences in endpoints between the station immediately upstream (RG_ERKUT) and immediately upstream (RG_ERCKDT). Additional comparisons were made upstream (RG_MI3) and downstream (RG_MIDER) of Erickson Creek in Michel Creek as well as between additional areas in Michel Creek. Where there were significant differences a magnitude of difference (MOD) for each year comparison was calculated as:

$$MOD = \frac{(MCT_{Treated After} - MCT_{Untreated After}) - (MCT_{Treated Before} - MCT_{Untreated Before})}{Pooled SD}$$

where the measures of central tendency (MCT) are the estimated marginal means from the full ANOVA model. The MOD captures the change in the difference between treated and

untreated stations before and after treatment relative to the variability within a station in a given year. All analysis was conducted in R (R Core Team, 2021).

A3.3 Biomass and Density (HESS)

A3.3.1 Sample Collection

Samples for analysis of benthic invertebrate density and biomass were collected using a Hess sampler (0.1 m² sampling area) with 500 µm mesh. Ten single-Hess samples were collected at each of two mine-exposed areas, one immediately upstream (RG_ERCKUT) and one downstream of the SRF outfall (RG_ERCKDT), with the replicate sampling locations a minimum of 5 m apart in September 2022 for analysis of benthic invertebrate biomass and density (Figure 1.3; Table 2.2).

A single sample was collected at each station by carefully inserting the base of the Hess sampler into the substrate to a depth of approximately 5 to 10 cm. Gravel or cobble enclosed within the Hess sampler was carefully washed while allowing the current to carry dislodged organisms into the mesh collection net. Organisms collected into the net were rinsed into the bottom of the net, and then into a labelled wide-mouth plastic jar. Samples were preserved to a nominal concentration of 10% buffered formalin in ambient water within approximately 6 hours of collection, so biomass was not lost through predation or decomposition of tissues before the samples were sorted at the laboratory.

A3.3.2 Laboratory Analysis

Benthic invertebrate biomass samples were sent to ZEAS Inc. (lead taxonomist Danuta Zaranko) in Nobleton, ON, for sorting and taxonomic identification. At the laboratory, preserved organisms in each sample were sorted from the sample debris, identified, and weighed at the family-level of taxonomy. Each family group of organisms was placed onto a fine cloth to drain excess surface moisture before being weighed to the nearest 0.1 mg. Total and family-level density and biomass were reported for each sample.

A3.3.3 Data Analysis

Laboratory data for benthic invertebrate biomass and density samples were converted to units of number of organisms per square meter (org/m²) based on the known area sampled. To understand the influence of the SRF on productivity measures of biomass and density of benthic invertebrates were evaluated (as well as evaluations of periphyton coverage and water quality as discussed in earlier sections). Overall biomass and density of benthic invertebrates as well as taxa-specific measures (specifically EPT, Ephemeroptera alone, Plecoptera alone,

Trichoptera alone, and Chironomidae alone) of these endpoints, determined via Hess sampling, were converted to number of organisms per square metre based on the area sampled. A spatial comparison between areas upstream (RG_ERCKUT) and downstream (RG_ERCKDT) of SRF water treatment were conducted using a Student's t-test, with $\alpha = 0.1$. When the assumption of normality was met, but homogeneity of variance was not, a t-test with unequal variance was used (Ruxton 2006). In instances where normality could not be achieved through data transformation, the non-parametric Mann-Whitney U-test was used. Statistical comparisons were conducted using R (R Core Team 2022). A magnitude of difference (MOD) was calculated for each endpoint as:

$$MOD = \frac{(MCT_{Downstream} - MCT_{Upstream})}{SD_{Upstream}} \times 100\%$$

, where the measures of central tendency (MCT) were means (untransformed) or geometric means (\log_{10} transformed) and the SD was standard deviation. The MOD calculations were conducted on the transformed scale when the data were transformed for analysis. When the Mann-Whitney test was used, the MOD was estimated using median values instead of means, and the Median Absolute Deviations (MAD) instead of SD.

A3.4 Benthic Invertebrate Tissue

A3.4.1 Sample Collection

Benthic invertebrate samples were collected for tissue chemistry using the kick and sweep sampling method described in section A3.2.1, except that sample collection was not timed. Samples were a composite of representative benthic invertebrate taxa in each sampling area. For each sample, clean tweezers were used to pick invertebrates from the debris until about 1 to 2 g wet weight (ww) was obtained. A photo was taken of each sample, and the dominant taxa added to the sample was recorded. Once sufficient tissue was picked from the debris, the sample was placed in a labelled vial and stored in a cooler with ice packs until it could be transferred to a freezer at the end of the day. Tissue samples were stored in a freezer and shipped frozen.

Upon collection of the sample using the kick and sweep sampling method at each replicate station, organisms were carefully removed from sample debris using tweezers until about 0.5 g of wet tissue was obtained. Field crews paid particular attention to proportions of annelids in kick and sweep collections, as these organisms have been known to hyperaccumulate some metals resulting in potentially biased results (Golder 2021). If annelids occurred at a proportion greater than 5% of the total sample biomass at a given replicate station, then these organisms were included in the composite sample (at that same proportion). Additionally in this scenario,

a separate 'annelid only' sample was collected for analysis from the replicate station. If the proportion of annelids represented less than 5% of the sample biomass for a given station, these organisms were not included in the composite-taxa sample.

A3.4.2 Laboratory Analysis

Tissue samples were kept in a freezer until they were transported by courier in coolers with ice packs to TrichAnalytics Inc. in Saanichton, BC. Samples were dehydrated (<60°C) upon receipt by the laboratory and analyzed using Laser Ablation Inductively Coupled Plasma Mass Spectrometry (ICP-MS). Results were reported on a dry weight basis along with moisture content. Quality assurance/quality control measures associated with the tissue chemistry analyses included evaluation of laboratory duplicates and certified reference materials. Benthic invertebrate tissue data collected for the 2022 EVO LAEMP were of good quality as characterized by excellent detectability, appropriate LRLs, and excellent laboratory precision and accuracy (Appendix B). Therefore, the associated data can be used with a good level of confidence in the derivation of conclusions for this study.

A3.4.3 Data Analysis

Composite-taxa benthic invertebrate tissue selenium concentrations were plotted for each EVO LAEMP monitoring area sampled in 2022 relative to:

- the regional normal (reference area) range, defined as the 2.5th and 97.5th percentiles of tissue selenium concentrations measured in reference areas that have not been disturbed by mining in historical studies completed in the Elk River watershed from 1996 to 2019 reported in RAEMP (Minnow 2020);
- data from previous sampling periods from 2012 to present, where available;
- the Level 1 EVWQP benchmarks for effects to invertebrates (13 milligrams/kilogram [mg/kg] dry weight [dw]), dietary effects to birds (15 mg/kg dw), and dietary effects to juvenile fish (11 mg/kg dw; Golder 2014) (Appendix Table A.2);
- the Level 2 EVWQP benchmarks for effects to invertebrates (20 milligrams/kilogram [mg/kg] dry weight [dw]), dietary effects to birds (22 mg/kg dw), and dietary effects to juvenile fish (18 mg/kg dw; Golder 2014) (Appendix Table A.2); and
- the Level 3 EVWQP benchmarks for effects to invertebrates (27 milligrams/kilogram [mg/kg] dry weight [dw]), dietary effects to birds (41 mg/kg dw), and dietary effects to juvenile fish (26 mg/kg dw; Golder 2014) (Appendix Table A.2).

Tissue selenium concentrations were paired with corresponding water selenium concentrations and compared to predictions from selenium bioaccumulation model (Golder 2020a) and the bioaccumulation tool (i.e., the 'B-tool'; predicts selenium tissue concentrations accounting for differences in selenium species and sulphate concentrations [Golder 2020b]).

Temporal changes in benthic invertebrate tissue selenium concentrations were evaluated relative to the commissioning of EVO SRF. Specifically, an analysis of variance (ANOVA) was conducted to compare differences in selenium concentrations between the station Where there were significant differences a magnitude of difference (MOD) was calculated as:

$$MOD = \frac{MCT_{Treated, After} - MCT_{Predicted, After}}{MCT_{Predicted, After}} \times 100\%$$

where:

$$MCT_{Predicted, After} = MCT_{Untreated, After} + (MCT_{Treated, Before} - MCT_{Untreated, Before})$$

and the measures of central tendency (MCT) are the estimated marginal means from the full ANOVA model. The MOD captures the change in concentrations at the treated station relative to what was expected given the differences pre-treatment. All analysis was conducted in R (R Core Team, 2021).

	Selenium	µg/L	2	-	2014	Approved	Level 1 EVWQP Benchmark = 19 Level 2 EVWQP Benchmark = 74	-
	Silver [†]	mg/L	For hardness ≤ 100 mg/L, BCWQG = 0.00005 For hardness > 100 mg/L, BCWQG = 0.0015	For hardness ≤ 100 mg/L, BCWQG = 0.0001 For hardness > 100 mg/L, BCWQG = 0.003	1996	Approved	-	-
	Thallium	mg/L	0.0008	-	1997	Working	-	-
	Uranium	mg/L	0.0085	-	2011	Working	-	-
	Zinc [¶]	mg/L	For hardness ≤ 90 mg/L, BCWQG = 0.0075 For hardness 90 to 330 mg/L, BCWQG = $[7.5 + 0.75 (\text{hardness} - 90)] \times 0.001$; Maximum applicable hardness = 330 mg/L	For hardness ≤ 90 mg/L, BCWQG = 0.033 For hardness 90 to 500 mg/L, BCWQG = $[33 + 0.75 (\text{hardness} - 90)] \times 0.001$; Maximum applicable hardness = 500 mg/L	1999	Approved	-	-
	Aluminum	mg/L	When pH ≥ 6.5, BCWQG = 0.05 When pH < 6.5, BCWQG = $\exp[1.6 - 3.327(\text{median pH}) + 0.402(\text{median pH}^2)]$	When pH ≥ 6.5, BCWQG = 0.1 When pH < 6.5, BCWQG = $\exp[1.209 - 2.426(\text{pH}) + 0.286(\text{pH}^2)]$	2001	Approved	-	-
	Cadmium [¶]	µg/L	For hardness = 3.4 to 285 mg/L, BCWQG = $(\exp[0.736 \times \ln(\text{hardness}) - 4.943])$ Maximum applicable hardness = 285 mg/L	For hardness = 7 to 455 mg/L, BCWQG = $(\exp[1.03 \times \ln(\text{hardness}) - 5.274])$ Maximum applicable hardness = 455 mg/L	2015	Approved	Level 1 EVWQP Benchmark = $10^{0.8(\log(\text{hardness})) - 2.53}$ Maximum applicable hardness = 285 mg/L	-
Nickel	µg/L	-	-	-	Proposed	Level 1 Benchmark = $\log(\text{Benchmark}) = 0.547 \times (\log(\text{DOC})) + 0.411 \times (\log(\text{Hardness})) - 0.520 \times (\log(\text{Bicarbonate})) + 0.856$ Level 2 Benchmark = $\log(\text{Benchmark}) = 0.547 \times (\log(\text{DOC})) + 0.411 \times (\log(\text{Hardness})) - 0.520 \times (\log(\text{Bicarbonate})) + 1.011$ Level 3 Benchmark = $\log(\text{Benchmark}) = 0.547 \times (\log(\text{DOC})) + 0.411 \times (\log(\text{Hardness})) - 0.520 \times (\log(\text{Bicarbonate})) + 1.304$	-	
Copper	mg/L	Biotic Ligand Model	Biotic Ligand Model	2019	Approved	-	-	
Iron	mg/L	-	BCWQG = 0.35 mg/L	2008	Approved	-	-	

Notes: "-" = no data available. The EVWQP Level 1 Benchmark for Nitrate is consistent with the longer term BCWQG.
[§] British Columbia Working (BCMOECCS 2021a) or Accepted (BCMOECCS 2021b) Water Quality Guidelines for the Protection of Aquatic Life. For guidelines dependent on other analytes (e.g., hardness), guidelines were screened using concurrent values.
[†] When appropriate, site-specific Elk Valley Water Quality Plan Benchmarks (EVWQP; Teck 2014) or interim screening values were applied in addition to or instead of BC water quality guidelines. Interim screening values are displayed for nickel (Golder 2017b).
[‡] Temperature and pH dependent; range of minimum and maximum values.
[§] Dependent on concurrent chloride; range of values reported (BCMOECCS 2021b).
[¶] Dissolved oxygen guidelines represent a minimum value, and so exceedances were quantified below this guideline.
^{††} Unrestricted change permitted within this pH range.
^{‡‡} For hardness-based guidelines, concurrent hardness values were used for calculating guidelines. If hardness values exceeding the maximum applicable hardness, then guidelines were determined using the maximum applicable hardness. If hardness values is lower than the minimum hardness, then guidelines were determined using the minimum hardness.
^{§§} Chromium(VI) is the dominant oxidation state in oxygenated environments, and so its guideline was applied.
^{¶¶} The most conservative guideline (0.0000125 mg/L) was applied.

Table A.2: Selenium Benchmarks for Benthic Invertebrate Tissues in the Elk Valley

Tissue Type	Benchmark			Source
	Value (µg/g dw)	Type	Description	
Whole body	4 ^a	BC guideline	Interim guideline for aquatic dietary tissue based on weight of evidence of lowest published toxicity thresholds and no uncertainty factor applied	BCMOE (2014)
Whole body	13	Site-specific benchmark	Level 1 (~10% effect) benchmark for growth, reproduction and survival of invertebrates	Teck (2014)
Whole body	20	Site-specific benchmark	Level 2 (~20% effect) benchmark for growth, reproduction and survival of invertebrates	Teck (2014)
Whole body	27	Site-specific benchmark	Level 3 (~50% effect) benchmark for growth, reproduction and survival of invertebrates	Golder (2014)
Whole body	11	Site-specific benchmark	Level 1 (~10% effect) benchmark for dietary effects to juvenile fish (growth)	Teck (2014)
Whole body	18	Site-specific benchmark	Level 2 (~20% effect) benchmark for dietary effects to juvenile fish (growth)	Teck (2014)
Whole body	26	Site-specific benchmark	Level 3 (~50% effect) benchmark for dietary effects to juvenile fish (growth)	Golder (2014)
Whole body	15	Site-specific benchmark	Level 1 (~10% effect) benchmark for dietary effects to juvenile birds	Teck (2014)
Whole body	22	Site-specific benchmark	Level 2 (~20% effect) benchmark for dietary effects to juvenile birds	Teck (2014)
Whole body	41	Site-specific benchmark	Level 3 (~50% effect) benchmark for dietary effects to juvenile birds	Golder (2014)

Note: µg/g dw = micrograms per gram dry weight.

^a British Columbia (BC) guidelines were not used in assessment of benthic invertebrate selenium tissue concentrations. Assessment was completed relative to site-specific benchmarks only.

B1 INTRODUCTION

B1.1 Background

A variety of factors can influence the physical, chemical, and biological measurements made in an environmental study and thus affect the accuracy and/or precision of the data. Depending on their magnitude, inaccuracy and imprecision have the potential to affect the reliability of conclusions made from data; therefore, it is important to ensure that programs incorporate appropriate steps to control non-natural sources of data variability (i.e., minimize variability that does not reflect authentic spatial and temporal variability in the environment) and thus assure the quality of the data. Data quality as a concept is meaningful only when it relates to the intended use of the data. That is, one must know the context in which the data will be interpreted in order to establish a relevant basis for judging whether or not the data set is adequate. A data quality review (DQR) involves the comparison of field and laboratory measurement performance to Data Quality Objectives (DQOs) established for a particular study, such as evaluation of Laboratory Reporting Limits (LRL), blank sample data, data precision (based on field and laboratory duplicate samples), and data accuracy (based on matrix spike recoveries and/or analysis of standards or certified reference materials). Trusted analytical laboratories certified by Canadian Association for Laboratory Accreditation (CALA) or the National Environmental Laboratory Accreditation Program (NELAP) with a rigorous internal quality assurance program were selected to ensure the highest possible data quality. Data Quality Objectives were established *a priori* to reflect reasonable and achievable performance expectations (Table B.1). Programs involving many samples and analytes usually yield some results that exceed DQOs. This is particularly so for multi-element scans, as the analytical conditions are not necessarily optimal for every element included in the scan. Generally, scan results may be considered acceptable if no more than 20% of the parameters fail to meet DQOs. Overall, the intent of a DQR is not to reject any measurement that did not meet a DQO, but to ensure that any questionable data received more scrutiny to determine what effect, if any, this had on interpretation of results within the context of the project.

B1.2 Quality Control Samples

A DQR as conducted on all laboratory data collected as part of the 2022 Elkview Operations (EVO) Local Aquatic Effects Monitoring Program (LAEMP). The objective of a DQR is to define the overall quality of the data presented in the report, and, by extension, the confidence with which the data can be used to derive conclusions.

A DQR involves the examination of analytical results associated with several types of Quality Control (QC) samples collected or prepared in the field and laboratory. General QC samples collected for this project include the following:

- **Blanks** are samples of de-ionized water and/or appropriate reagent(s) that are handled and analyzed in the same way as regular samples. These samples will reflect any contamination of samples occurring in the field (in the case of field or travel blanks) or in the laboratory (in the case of laboratory or method blanks). Analyte concentrations should be below detection.
- **Laboratory Duplicates** are replicate sub-samples created in the laboratory from randomly selected field samples which are sub-sampled and then analyzed independently using identical analytical methods. The laboratory duplicate sample results reflect any variability introduced during laboratory sample handling and analysis and thus provide a measure of laboratory precision.
- **Field Duplicates** are samples collected from a randomly selected field station that are homogenized to the extent possible, split and analyzed separately in the laboratory. The duplicate samples are handled and analyzed in an identical manner in the laboratory.
- **Spike Recovery Samples** are created in the laboratory by adding a known amount/concentration of a given analyte (or mixture of analytes) to a randomly selected test sample previously divided to create two sub-samples. The spiked and regular sub-samples are then analyzed in an identical manner. The spike recovery represents the difference between the measured spike amount (total amount in the spiked sample minus the amount in the original sample) relative to the known spike amount (as a percentage). Two types of spike recovery samples are commonly analyzed: spiked blanks (or blank spikes) are created using laboratory control materials whereas matrix spikes (MS) are created using field-collected samples and are sometimes further tested in duplicate (matrix spike duplicates, MSD). The analysis of spiked samples provides an indication of the accuracy of analytical results.
- **Certified Reference Materials (CRM) or Reference Materials (RM)** are commercially prepared (or commercially homogenized) samples containing known chemical concentrations that are processed and analyzed along with batches of environmental samples. The sample results are then compared to the known concentrations to provide a measure of analytical accuracy. The results are reported as the percent of the known concentration that was recovered in the analysis.

- **Laboratory Control Samples** are created in the laboratory to have a known analyte concentration in a matrix free of interferences, such as deionized water or reference sand. The sample results are compared to the target results to confirm that the analytical method is accurate in a purified reference sample. The results are reported as the percent of the known concentration that was recovered in the analysis.
- **Laboratory Sorting Efficiency** are randomly selected grabs of the initially sorted community material. These samples are recounted and the number of invertebrates that were not recovered during the initial sort was determined. In order to reduce bias, recounting is conducted by an analyst uninvolved in the initial sample processing. This check is performed on 10% of samples and determines the accuracy through assessment of recovery (sorting) efficiency and quantifies any under-estimation of organism enumeration.
- **Taxonomic Quality Control Samples** are a randomly selected portion of a benthic invertebrate community field sample to be assessed by the laboratory using an internal quality control audit. A blind re-enumeration and re-identification of random samples is performed by an analyst uninvolved in the original sample processing. This assessment quantifies taxonomic misidentification among laboratory analysts and ensures accurate organism identities are reported.
- **Laboratory Subsamples** are community samples prepared by the laboratory to ensure that the fraction of the total sample examined was an accurate representation of the total number of organisms. By comparing the amount recovered between at least two sub-samples, one can assess the analytical precision. In addition, comparisons of the sub-samples from the whole community sample allows for an evaluation of sub-sampling accuracy.

B2 SURFACE WATER CHEMISTRY

B2.1 Laboratory Reporting Limits

The analytical reports for water chemistry from ALS Environmental Ltd. (ALS) and Brooks Applied Labs (BAL; see laboratory reports in Appendix H) were examined to assess LRLs relative to analyte concentrations and applicable guidelines (Tables B.2 and B.3). The LRLs for water quality analytes were assessed relative to British Columbia Water Quality Guidelines (BCWQG; BCMOECCS 2021a,b) for the protection of freshwater aquatic life, Elk Valley Water Quality Plan (EVWQP; Teck 2014) benchmarks, Updated Effects Concentrations (UEC; WSP Golder 2022), screening values for water quality (Teck 2020), and relevant site-specific benchmarks. Several analytes were reported at concentrations below the LRL in 100% of samples (Tables B.2 and B.3). For those analytes with one or more result(s) below the LRL, achieved LRLs were consistently lower than the BCWQG, EVWQP benchmarks, UEC, and screening values for water quality (as applicable), except for total mercury. The LRL for 96.7% of total mercury samples was 0.000005 mg/L, which is higher than the BCWQG of 0.00000125 µg/L; however, Azimuth (2019) determined that mercury inputs (total and methyl) in the Elk Valley area are not related to mining activities. Therefore, the achieved LRLs were appropriate for this study.

B2.2 Laboratory and Field Blanks

A total of 710 method blank (MB) samples were analyzed in the ALS laboratory reports (Appendix H). Of the 3,695 reported MB individual analyte results, only three results were above detection (one result each for total chromium, total magnesium, and total vanadium; see laboratory reports CG2215311 and CG2212628 in Appendix H). The MB exceedance for total vanadium was below five-times the blank level and the laboratory reporting limit was appropriately adjusted for total vanadium results within this laboratory report. As only three results (0.081% of MB results) did not meet the laboratory DQO and these did not include any primary analytes, these laboratory flags had a negligible impact on ALS water chemistry data reliability and laboratory precision was overall considered excellent.

A total of 260 MB samples were analyzed in the BAL laboratory reports (Appendix H). Of the 1,128 reported MB results, 49 results were above the LRL (12 results for selenite and 37 results each for total selenium; see laboratory reports 2203148, 2203149, 2203150, 2205070, 2205072, 2205073, 2206143, 2207083, 2208056, and 2208059 in Appendix H) and so did not meet the DQO. As only 4.34% of MB results did not meet the DQO, laboratory contamination

was not considered to be of concern and BAL laboratory precision was overall considered excellent.

To assess the potential for field sampling contamination, 15 field blank samples and 12 trip blank samples were submitted to ALS for water chemistry analyses (Table B.4). The same DQOs that were used for laboratory blanks were also used for field blanks (i.e., concentrations should be below the LRL). Of the 1,455 individual analyte results measured in the field blanks, only 37 results were above the LRL and did not meet the laboratory DQO (2.52% of results; one result each for acidity, total ammonia, total nickel, silicon, and strontium, and dissolved aluminum, magnesium, manganese, strontium, and zinc, two results each for total barium and molybdenum, three results each for total sodium, tin and dissolved copper, four results each for dissolved sodium and tin, and five results for dissolved barium; Table B.4). Of the 957 individual analyte results for trip blank samples, only 12 results (1.25% of results; one result each for Total Kjeldahl Nitrogen (TKN), total barium, magnesium, sulphur and dissolved silicon, and seven results for total ammonia) were above the LRL and did not meet the laboratory DQO (Table B.4). However, none of the analytes that were above detection in field or trip blank samples were analytes of concern in the EVO LAEMP. Additionally, as relatively few results were above detection in field or trip blanks (2.52 and 1.25%, respectively), field and laboratory contamination of water samples was considered of little to no concern and ALS laboratory precision was overall considered good.

To assess potential field sampling contamination, 10 field blank samples were submitted to BAL for aqueous selenium speciation analyses. Of the 134 individual analyte results measured in the field blanks, only 16 results were above the LRL and did not meet the laboratory DQO (11.9% of results; two results each for volatile dimethylselenide and selenite, three results for selenate, four results for dissolved selenium, and five results for total selenium; Table B.5). As relatively few results were above detection, field contamination of water samples was considered of little to no concern and BAL laboratory precision was overall considered good.

B2.3 Data Precision

A total of 62 laboratory duplicate samples were used to evaluate precision within the ALS laboratory reports (Appendix H). All of the 3,490 individual analyte results met the laboratory DQO and ALS laboratory analytical precision was considered excellent. A total of 57 laboratory duplicate samples were used to evaluate precision within the BAL laboratory reports (Appendix H). All of the 230 individual analyte results met the laboratory DQO and BAL laboratory analytical precision was considered excellent.

For water chemistry analyzed by ALS, 16 sets of field duplicate samples were collected to assess field sampling precision (Table B.6). Several relative percent differences (RPDs) could not be calculated as both analyte concentrations were below the LRL. Of the 1,097 RPDs that could be calculated, 90 RPDs were greater than the DQO of 30% (Table B.6). As a relatively low number of RPDs (8.20% of all results) were greater than 30% and most of those analytes were of low concern for the EVO LAEMP, field sampling precision was overall considered good.

To assess field sampling precision for selenium speciation, 16 sets of field duplicate samples were collected (Table B.7). Relative percent differences could not be calculated for several selenium speciation duplicate samples as the analyte concentrations in both samples were below the LRL. Of the 75 comparisons that could be calculated, 13 did not meet the DQO of 30% (one RPD for methylseleninic acid, two RPDs for total and dissolved selenium, three RPDs for selenate, and five RPDs for selenite; Table B.7). As 17.3% of all field duplicate comparisons did not meet the DQO, field sampling precision was overall considered adequate.

B2.4 Data Accuracy

Data accuracy within the ALS laboratory reports was evaluated based on results of 833 Laboratory Control Samples (LCS) and 120 Matrix Spike (MS) samples (see laboratory reports in Appendix H). All of the 3,650 LCS analyte results met the laboratory DQO. Of the 3,251 MS analyte results, three did not meet the laboratory DQO (0.09%; one result for TKN and two results for total chromium, see laboratory reports CG2204866, CG2209850, and CG2209854 in Appendix H). This TKN MS result was low due to interference from high nitrate in the initial sample, which causes negative bias on TKN. Recovery could not be calculated in several MS samples as background levels were greater than or equal to the initial spike concentration. However, as several other QC tests were successful and matrix spike issues due to high background presence is not uncommon, MS recovery not being calculable in several MS samples was not of great concern. Overall, the accuracy achieved by ALS was considered excellent.

Data accuracy within the BAL laboratory reports was evaluated based on results of 135 LCS, 57 MS samples, 57 Matrix Spike Duplicate (MSD) samples, and 100 Reference Material (RM) samples (see laboratory reports in Appendix H). All 248 LCS, 125 MS, 125 MSD, and 100 RM individual analyte results met the laboratory DQO. Therefore, the accuracy achieved by BAL was considered excellent.

B2.5 Hold Times

The recommended hold times for pH and oxidation-reduction potential (ORP) analyses (0.25 hrs) were exceeded in all samples collected. As *in situ* pH was used for data interpretation, these pH exceedances had no impact on data interpretability. Additionally, ORP is not used in any further analyses. The recommended hold times for nitrite and nitrate were exceeded by one day each in three samples, by two days in four samples, and by seven days in one sample. The recommended hold time for nitrite was also exceeded by one day in eight samples, by three days in three samples, and by four days in two samples. The recommended hold time for nitrate was also exceeded by one day in 13 samples, by three days in two samples, and by four days in three samples. The recommended hold times for turbidity and dissolved orthophosphate were exceeded by one day in two samples and by one day in five samples. The recommended hold times for turbidity were also exceeded by one to six hours in five samples, by two days in three samples, and by three days in six samples. The recommended hold times for dissolved orthophosphate was also exceeded by three days in seven samples and by four days in two samples. All hold times were met for selenium speciation samples, but filtration hold times were exceeded for dissolved selenium, dimethylselenoxide, methylseleninic acid, methaneselenonic acid, selenite, selenate, selenocyanate, selenomethionine, selenosulfate, and unknown selenium species in one sample each. Overall, few samples exceeded hold times and hold time exceedances are expected to have little effect on the interpretation of results.

B2.6 Other Concerns

Several TKN concentrations in water samples may have been biased low due to high nitrate concentrations. This may have lowered results for TKN in field duplicate samples, thereby increasing the RPD calculated between two of the field duplicate sample pairs.

B2.7 Data Quality Statement

Water chemistry data collected for the 2022 EVO LAEMP were of acceptable quality as characterized by good detectability, appropriate LRLs, minimal evidence of laboratory or field contamination, good laboratory and field precision and accuracy, and few hold time exceedances. Overall, the associated water chemistry data from ALS and BAL can be used with a high level of confidence in the derivation of conclusions.

B3 INTERSTITIAL WATER CHEMISTRY

B3.1 Laboratory Reporting Limits

The analytical reports for interstitial water chemistry from ALS and BAL (see laboratory reports in Appendix H) were examined to assess LRLs relative to analyte concentrations and applicable guidelines (Tables B.8 and B.9). The LRLs for water quality analytes were assessed relative to BCWQG (BCMOECCS 2021a,b) for the protection of freshwater aquatic life, EVWQP benchmarks (Teck 2014), UEC (WSP Golder 2022), screening values for water quality (Teck 2020), and relevant site-specific benchmarks. Several analytes were reported at concentrations below the LRL in 100% of samples (Tables B.8 and B.9). For those analytes with one or more result(s) below the LRL, achieved LRLs were consistently lower than the BCWQG, EVWQP benchmarks, UEC, and screening values for water quality (as applicable). Overall, the achieved LRLs were appropriate for this study.

B3.2 Laboratory and Field Blanks

A total of 57 MB samples were analyzed in the ALS laboratory reports (Appendix H). Of the 419 reported MB individual analyte results, only two results were above detection (one result each for total chromium and total magnesium; see laboratory reports CG2215311 and CG2212628 in Appendix H). As these exceedances only represent 0.48% of MB results and these did not include any primary analytes, detectable MB concentrations had a negligible impact on water chemistry data reliability and ALS laboratory precision was overall considered excellent. A total of 36 MB samples were analyzed in the BAL laboratory reports (Appendix H). All of the 260 reported MB results met the laboratory DQO and so BAL laboratory precision was overall considered excellent. No field blank samples or trip blank samples were collected for interstitial water chemistry.

B3.3 Data Precision

A total of 10 laboratory duplicate samples were used to evaluate precision within the ALS laboratory reports (Appendix H). All of the 296 individual analyte results met the laboratory DQO and ALS laboratory analytical precision was considered excellent. A total of 17 laboratory duplicate samples were used to evaluate precision within the BAL laboratory reports (Appendix H). All of the 121 individual analyte results met the laboratory DQO and BAL laboratory analytical precision was considered excellent. No field duplicate samples were collected for interstitial water chemistry.

B3.4 Data Accuracy

Data accuracy within the ALS laboratory reports was evaluated based on results of 66 LCS and 14 MS samples (see laboratory reports in Appendix H). All of the 416 LCS analyte results and 392 MS analyte results met the laboratory DQO. Recovery could not be calculated in several MS samples as background levels were greater than or equal to the initial spike concentration. However, as several other QC tests were successful and matrix spike issues due to high background presence is not uncommon, MS recovery not being calculable in several MS samples was not of great concern. Overall, the accuracy achieved by ALS was considered excellent.

Data accuracy within the BAL laboratory reports was evaluated based on results of 12 LCS, 17 MS samples, 17 MSD samples, and five RM samples (see laboratory reports in Appendix H). All 40 LCS, 56 MS, 56 MSD, and five RM individual analyte results met the laboratory DQO. Therefore, the accuracy achieved by BAL was considered excellent.

B3.5 Hold Times

The recommended hold times for nitrite and nitrate were exceeded by two days in five samples. None of the above hold time exceedances are expected to impact conclusions derived from the data but will still be taken into consideration during data interpretation. All hold times were met for selenium speciation samples, but the recommended filtration hold time was exceeded for one dissolved selenium sample. Overall, few samples exceeded hold times and hold time exceedances are expected to have little effect on the interpretation of results.

B3.6 Data Quality Statement

Interstitial water chemistry data collected for the 2022 EVO LAEMP were of acceptable quality as characterized by good detectability, appropriate LRLs, minimal evidence of laboratory contamination, excellent laboratory precision and accuracy, and few hold time exceedances. Overall, the associated water chemistry data from ALS and BAL can be used with a high level of confidence in the derivation of conclusions.

B4 SEDIMENT CHEMISTRY

B4.1 Laboratory Reporting Limits

The analytical reports for sediment chemistry from ALS and BAL (see laboratory reports in Appendix H) were examined to assess LRLs relative to analyte concentrations and applicable guidelines (Tables B.10 and B.11). The LRLs for these analytes were assessed relative to existing British Columbia Working Sediment Quality Guidelines (BCWSQG; BCMOECSS 2021a). Several analytes were reported at concentrations below the LRL in 100% of samples (Tables B.10 and B.11). Although several metals had at least one result below the LRL, all metal and selenium speciation LRLs were above the relevant guidelines and were therefore considered appropriate for this study. However, several LRLs for polycyclic aromatic hydrocarbons (PAHs) were below the BCWSQG Interim Sediment Quality Guideline (ISQG), including 100% of LRLs for acenaphthene, benzo(a)pyrene, dibenz(a,h)anthracene, fluorene, and phenanthrene (Tables B.10 and B.11). These relatively high LRLs were likely due to a combination of chromatographic interference due to PAH co-elution effects and high moisture content (resulting in low sample volume) in specific sediment samples. Sediment LRLs were overall considered appropriate for this study, and relatively high LRLs for PAHs will be considered during data interpretation. No LRLs for PAHs were above the BCWSQG Probable Effect Level (PEL). Overall, the achieved LRLs were appropriate for this study.

B4.2 Laboratory Blanks

A total of 143 MB samples were analyzed in the ALS laboratory reports (see laboratory reports in Appendix H). Of the 404 reported MB individual analyte results, only one result was above detection (vanadium; see laboratory report CG2204662 in Appendix H). As this DQO exceedance only represent 0.25% of MB results and did not include any primary analytes, these laboratory flags had a negligible impact on sediment chemistry data reliability and ALS laboratory precision was overall considered excellent.

A total of 348 MB samples were analyzed in the BAL laboratory reports (see laboratory reports in Appendix H). Of the 988 reported MB individual analyte results, only four results were above detection (four results for selenium fraction two; see laboratory report 2211152 in Appendix H). As these DQO exceedances only represent 0.40% of MB results and did not include any primary analytes, these laboratory flags had a negligible impact on sediment chemistry data reliability and BAL laboratory precision was overall considered excellent.

B4.3 Data Precision

A total of 76 laboratory duplicate samples were used to evaluate precision within the ALS laboratory reports (see laboratory reports in Appendix H). Of the 1,661 individual analyte results, 12 results did not meet the laboratory DQO (one result each for chromium, cobalt, manganese, molybdenum, nickel, selenium, sodium, benz(a)anthracene, benzo(a)pyrene, benzo(b+j)fluoranthene, benzo(k)fluoranthene, and indeno(1,2,3-c,d)pyrene; see laboratory reports CG2205458 and CG2208567 in Appendix H). As these exceedances only represent 0.72% of laboratory duplicate results, ALS laboratory analytical precision was considered excellent.

A total of 300 laboratory duplicate samples were used to evaluate precision within the BAL laboratory reports (see laboratory reports in Appendix H). All of the 868 individual analyte results met the laboratory DQO and so BAL laboratory analytical precision was considered excellent.

To assess field sampling precision for sediment chemistry, eight sets of field duplicate samples were submitted to ALS (Table B.12). Several RPDs could not be calculated as both analyte concentrations in the pair were below the LRL. Of the 255 RPDs that could be calculated, only 31 were greater than the DQO of 30% (12.2% of comparisons; Table B.12). One set of field duplicate samples was submitted to BAL (Table B.12). Several RPDs could not be calculated as both analyte concentrations in the pair were below the LRL. Of the 11 RPDs that could be calculated, only two were greater than 30% (18.2% of comparisons; Table B.12). As the above DQO exceedances represent 12.2 and 18.2% of field duplicate comparisons from samples submitted to ALS and BAL, respectively, sediment data was overall considered to have adequate field precision and reproducibility.

B4.4 Data Accuracy

Data accuracy for sediment chemistry analyses completed by ALS was evaluated based on the analysis of 177 LCS samples, 17 MS samples, and 1,037 RM samples. All 1,618 LCS, 404 MS, and 334 RM individual analyte results met the laboratory DQO. Therefore, the accuracy achieved by ALS was considered excellent.

Data accuracy within the BAL laboratory reports was evaluated based on results of 41 LCS, 34 MS samples, 34 MSD samples, and 22 RM samples (see laboratory reports in Appendix H). All 41 LCS, 40 MS, 40 MSD, and 22 RM individual analyte results met the laboratory DQO. Therefore, the accuracy achieved by BAL was considered excellent.

B4.5 Hold Times

The recommended hold time for mercury was exceeded by one day in three samples (see laboratory report CG2213498 in Appendix H). The recommended hold times for PAHs were exceeded by two days in six samples, by three days in four samples, and by four days in 10 samples (see laboratory reports CG2213414 and CG2213420 in Appendix H). These hold time exceedances are expected to have minimal impact on the data; however, this will be considered during interpretation of results. All hold times were met for sediment selenium speciation samples.

B4.6 Data Quality Statement

Sediment chemistry data collected for the 2022 EVO LAEMP were of acceptable quality as characterized by appropriate LRLs, good detectability, excellent laboratory precision and accuracy, adequate field precision and reproducibility, and few hold time exceedances. Overall, the associated data were considered acceptable for this study.

B5 BENTHIC INVERTEBRATE COMMUNITY

B5.1 Sub-Sampling proportions, Precision, and Accuracy

The analytical report from Cordillera Consulting Inc. (Cordillera; laboratory report in Appendix H) was examined to assess sub-sampling accuracy. For all samples, Canadian Aquatic Biomonitoring Network (CABIN) protocols were followed for sub-sampling (i.e., identification of a minimum 300 invertebrates), with a minimum of 5% of a sample being assessed. All 32 benthic invertebrate community structure samples submitted to Cordillera were subsampled (Table B.13) while all benthic invertebrate community samples submitted to ZEAS Inc. were examined in their entirety. Both the precision and accuracy of the three sub-samples randomly chosen for sub-sample assessment by Cordillera met the DQO in all sub-samples (20%; Table B.14). Thus, the precision and accuracy for sub-sampling of the benthic invertebrate community samples was considered excellent.

B5.2 Organism Sorting Efficiency

To measure the effectiveness of the sorters in sampling submitted to Cordillera at least 10% of samples were selected at random for resorting analysis by a different sorter. Sorting efficiency (i.e., percent recovery) of benthic invertebrate samples was excellent, achieving an average of 98.7% for the three community structure samples evaluated (Table B.15). Therefore, organism sorting efficiency was considered excellent.

B5.3 Taxonomic Identification Accuracy

Cordillera performed an internal audit of taxonomic identification for at least 10% of all community structure samples (n = 3; Table B.16). The analysts reported a total identification error rate (TIR) of 0%, a percent difference in enumeration (PDE) of 0.140 to 0.316%, a percent taxonomic disagreement (PTD) of 0.560 to 0.946%, and a Bray Curtis Dissimilarity Index (BCDI [which is a measure of the differences in identifications between different analysts] of 0.004 to 0.006). The laboratory DQO was based on TIR as per CABIN laboratory methods (<5% TIR; Environment Canada 2014). As the TIR was below 5% for all samples examined, the taxonomic accuracy of Cordillera Consulting Inc was considered excellent. No quality control samples were examined by ZEAS Inc.

B5.4 Data Quality Statement

Benthic invertebrate community data collected for the EVO LAEMP were of excellent quality as characterized by excellent sub-sampling precision and accuracy, sorting efficiency and

taxonomic identification accuracy. Therefore, the associated data can be used with a high level of confidence in the derivation of conclusions.

B6 BENTHIC INVERTEBRATE TISSUE CHEMISTRY

B6.1 Laboratory Reporting Limits

Analytical reports of benthic invertebrate tissue metal concentrations from TrichAnalytics Inc. (see laboratory reports in Appendix H) were examined to provide an inventory of analyte results below the LRL and to compare the LRLs for these analytes to available benchmarks (Table B.17). Most analyte concentrations were consistently above detection limits, except for several results for antimony, arsenic, mercury, and tin (0.24 to 18.5% of results for each analyte). However, all results for selenium were above detection and selenium is the only analyte with an applicable guideline. Therefore, the achieved LRLs were appropriate for this study.

B6.2 Data Accuracy and Precision

Data accuracy and precision were evaluated based on the analysis of 44 CRM samples. No CRM results for titanium could be calculated as the certified concentrations were too close to the reportable detection limit (see laboratory reports in Appendix H). All of the 1,276 CRM results that could be calculated for other analytes met the laboratory DQO. As titanium is not an analyte of concern in benthic invertebrate tissue in the EVO LAEMP, laboratory accuracy and precision as determined by CRM analyses was overall considered excellent.

Laboratory precision was also evaluated by duplicate analysis of 47 benthic invertebrate tissue samples (see laboratory reports in Appendix H). Several results could not be calculated due to values below the detection limit. However, all duplicate results that could be calculated met the laboratory DQO. Therefore, laboratory precision as determined by duplicate analyses was considered excellent.

B6.3 Hold Times

All recommended hold times were met for all benthic invertebrate tissue samples.

B6.4 Data Quality Statement

Benthic invertebrate tissue data collected for the 2022 EVO LAEMP were of good quality as characterized by excellent detectability, appropriate LRLs, and excellent laboratory precision and accuracy. Therefore, the associated data can be used with a good level of confidence in the derivation of conclusions for this study.

B7 PERIPHYTON AND BRYOPHYTE TISSUE CHEMISTRY

B7.1 Laboratory Reporting Limits

Analytical reports of periphyton and bryophyte tissue metal concentrations from ALS and TrichAnalytics Inc. (see laboratory reports in Appendix H) were examined to provide an inventory of analyte results below the LRL and to compare the LRLs for these analytes to available benchmarks (Table B.18). Most analyte concentrations were consistently above detection limits, except for several results for arsenic, beryllium, bismuth, boron, cesium, chromium, copper, lithium, mercury, sodium, tellurium, tin, and zirconium (0.22 to 75.0% of results for each analyte). However, all results for selenium were above detection and selenium is the only analyte with an applicable guideline. Therefore, the achieved LRLs were appropriate for this study.

B7.2 Laboratory and Field Blanks

A total of 94 MB samples were analyzed in the ALS laboratory reports for periphyton and bryophyte tissue chemistry (see laboratory reports in Appendix H). Of the 1,633 reported MB individual analyte results, only four results were above detection (one result for iron and three results for manganese; see laboratory reports CG2205369, CG2215410, and CG2216142 in Appendix H). As these exceedances only represent 0.24% of MB results and did not include any primary analytes, these laboratory flags had a negligible impact on tissue chemistry data reliability and ALS laboratory precision was overall considered excellent.

B7.3 Data Accuracy and Precision

Data accuracy for periphyton and bryophyte tissue chemistry analyses completed by ALS was evaluated based on the analysis of 94 LCS samples and 47 RM samples. Out of 1,736 LCS results, only two did not meet the DQO (two results for beryllium; see laboratory report CG2213441 in Appendix H). However, the DQO in these cases was only marginally exceeded (by <10%) for less than 10% of analytes in a Multi-Element Scan, which is considered acceptable as per the Ontario Ministry of the Environment, Conservation, and Parks (previously the Ontario Ministry of the Environment; OMOE) and Canadian Council of Ministers of the Environment (CCME; see laboratory report CG2213441 in Appendix H). Out of 1,181 RM results, eight did not meet the DQO (one result for calcium, two results each for lead and aluminum, and three results for nickel; see laboratory reports CG2205366, CG2204664, CG2204665, CG2205355, CG2205369, CG2208566, and CG2216723 in Appendix H). However, the DQO for the above analytes was only marginally exceeded (by <10%) for less than 10% of analytes in a Multi-Element Scan, which is considered acceptable as per the

Ontario Ministry of the Environment, Conservation, and Parks (previously the Ontario Ministry of the Environment; OMOE) and Canadian Council of Ministers of the Environment (CCME; see laboratory reports in Appendix H). Overall, as the above DQO exceedances only represent 0.12% of LCS results and 0.68% of RM results, the accuracy achieved by ALS was considered excellent.

Data accuracy for periphyton and bryophyte tissue chemistry analyses completed by Trich Analytics were evaluated based on the analysis of five CRM samples. No CRM results for titanium could be calculated as the certified concentrations were too close to the reportable detection limit (see laboratory reports in Appendix H). All of the 145 CRM results that could be calculated for other analytes met the laboratory DQO. As titanium is not an analyte of concern in benthic invertebrate tissue in the EVO LAEMP, laboratory accuracy and precision as determined by CRM analyses was overall considered excellent.

Laboratory precision for Trich Analytics was also evaluated by duplicate analysis of eight periphyton and bryophyte tissue chemistry samples (see laboratory reports in Appendix H). Of the 240 results, 19 comparisons could not be calculated due to values below the detection limit. However, all duplicate results that could be calculated met the laboratory DQO. Therefore, laboratory precision as determined by duplicate analyses was considered excellent.

B7.4 Hold Times

All recommended hold times were met for all periphyton and bryophyte tissue samples.

B7.5 Data Quality Statement

Periphyton and bryophyte tissue data collected for the 2022 EVO LAEMP were of good quality as characterized by excellent detectability, appropriate LRLs, and excellent laboratory precision and accuracy. Therefore, the associated data can be used with a good level of confidence in the derivation of conclusions for this study.

B8 PERIPHYTON PRODUCTIVITY

Dry weight, ash weight, ash-free dry weight, and chlorophyll a results were examined to assess LRLs relative to analyte concentrations (see laboratory report CG2215002 in Appendix H). All results were above the LRL except for one result for ash free dry weight (11.1% of results for ash free dry weight; Table B.19). Overall, the achieved LRLs were appropriate for the study.

B8.1 Laboratory Blanks

A total of eight MB samples were analyzed in the ALS laboratory reports for periphyton productivity (see laboratory reports in Appendix H). All of the 64 reported MB individual analyte results met the laboratory DQO (see laboratory report CG2215002 in Appendix H). Therefore, laboratory precision was overall considered excellent.

B8.2 Data Accuracy

The accuracy of chlorophyll a analyses conducted by ALS was evaluated based on results of eight LCS (see laboratory reports in Appendix H). All 64 LCS results met the laboratory DQO (see laboratory report CG2215002 in Appendix H). Therefore, accuracy achieved by the laboratory in this study was considered excellent.

B8.3 Hold Times

All recommended hold times were met for all periphyton productivity and community samples.

B8.4 Data Quality Statement

Periphyton productivity measurements (dry weight, ash weight, ash-free dry weight, and chlorophyll a) collected for the 2022 EVO LAEMP were of acceptable quality as illustrated by appropriate LRLs, no apparent laboratory contamination, and excellent laboratory accuracy. Therefore, the associated data can be used with a good level of confidence in the derivation of conclusions.

B9 DATA QUALITY REVIEW SUMMARY

Overall, the quality of the data collected for this project was considered acceptable for the derivation of conclusions associated with the objectives of the 2022 EVO Dry Creek LAEMP, with the exception of periphyton community sub-sampling precision. The relatively low degree of precision seen in periphyton community sub-sampling illustrates the need for QA/QC procedures during this process.

Notes: Only analytes with at least one result < Laboratory Reporting Limit (LRL) or LRL were above guidelines were displayed. The total number of samples in 2022 (n) was 145. Aqueous chlorophyll a, ash weight, and ash free dry weight were only analyzed in 18 samples. Dissolved mercury was only analyzed in 121 samples. EVWQP = Elk Valley Water Quality Plan; "-" = no applicable guideline exists. □

^a British Columbia Water Quality Guidelines for the protection of Aquatic Life (BCMOECCS 2021a,b).

^b Where more than one EVWQP Level 1 Benchmark, screening value, or Updated Effects Concentration (UEC; WSP Golder 2022) was applicable, the most conservative (lowest) value was used.

^c Guideline is the most conservative (lowest), based on estimates of a maximum temperature of 20°C and a minimum pH of 8.04.

^d Minimum water quality guidelines for Nitrite (as N) reported in BCMOECSS (2021a) for chloride concentrations < 2 mg/L.

^e Guideline for Chromium VI (0.001 mg/L) was selected, as this is the principal species found in surface waters.

^f Hardness-based guidelines calculated using the minimum hardness observed for all samples.

^g The most conservative guideline (0.125 µg/L) was applied.

^h Guideline based on minimum field pH.

Table B.3: Laboratory Reporting Limit (LRL) Evaluation for Surface Water Selenium Speciation Analyses, EVO LAEMP, 2022

Parameter	Units	Range of LRLs	No. Sample Results < LRL
Dimethylselenoxide (volatile)	µg/L	0.01	28 (100%)
Dimethyldiselenide (volatile)	µg/L	0.01	28 (100%)
Methylseleninic Acid	µg/L	0.01	162 (81.0%)
Methaneselenonic Acid	µg/L	0.01	200 (100%)
Selenite	µg/L	0.01 to 0.02	28 (13.9%)
Selenocyanate	µg/L	0.01	200 (99.5%)
Selenomethionine	µg/L	0.01	200 (100%)
Selenosulfate	µg/L	0.01	199 (99.5%)
Unknown Selenium Species	µg/L	0.01 to 0.03	197 (98.0%)

Notes: Only analytes with at least one result < Laboratory Reporting Limit (LRL) or LRL were above guidelines were displayed. No guideline existed for any analyte that had at least one result below the LRL. The total number of samples in 2022 (n) was 200; however, volatile dimethylselenoxide and dimethylselenide were only measured in 28 samples each.

Indicates RPD exceeded 30%.

Notes: RPD = relative percent difference; "-" = no data/not calculated; LRL = Laboratory Reporting Limit. The RPD was calculated using < LRL results at the LRL if one result in a duplicate pair was below the LRL. The RPD was not calculated if both results were < LRL. Turbidity was not analyzed in duplicate samples.

Indicates RPD exceeded 30%.

Notes: RPD = relative percent difference; "-" = no data/not calculated; LRL = Laboratory Reporting Limit. The RPD was calculated using < LRL results at the LRL if one result in a duplicate pair was below the LRL. The RPD was not calculated if both results were < LRL. Turbidity was not analyzed in duplicate samples.

■ Indicates RPD exceeded 30%.

Notes: RPD = relative percent difference; "-" = no data/not calculated; LRL = Laboratory Reporting Limit. The RPD was calculated using < LRL results at the LRL if one result in a duplicate pair was below the LRL. The RPD was not calculated if both results were < LRL. Turbidity was not analyzed in duplicate samples.

Indicates RPD exceeded 30%.

Notes: RPD = relative percent difference; "-" = no data/not calculated; LRL = Laboratory Reporting Limit. The RPD was calculated using < LRL results at the LRL if one result in a duplicate pair was below the LRL. The RPD was not calculated if both results were < LRL. Turbidity was not analyzed in duplicate samples.

Indicates RPD exceeded 30%.

Notes: RPD = relative percent difference; "-" = no data/not calculated; LRL = Laboratory Reporting Limit. The RPD was calculated using < LRL results at the LRL if one result in a duplicate pair was below the LRL. The RPD was not calculated if both results were < LRL. Turbidity was not analyzed in duplicate samples.

Unknown Selenium Species fraction 1	mg/kg dw	<0.003	<0.003	-
Unknown Selenium Species fraction 2	mg/kg dw	<0.003	<0.003	-
Unknown selenium species - F2 Fraction	mg/kg dw	0.018	<0.003	83.3

 Value was above the data quality objective of $\leq 30\%$ Relative Percent Difference (RPD).

Notes: LRL = Laboratory Reporting Limit. If one result in a duplicate pair was below the LRL, RPD was calculated using the LRL in place of the value below detection results. RPD was not calculated if both results were < LRL. "-" indicates that the RPD was not calculated; "dw" = dry weight.

Value was above the data quality objective of ≤ 30% Relative Percent Difference (RPD).

Notes: LRL = Laboratory Reporting Limit. If one result in a duplicate pair was below the LRL, RPD was calculated using the LRL in place of the value below detection results. RPD was not calculated if both results were < LRL. "-" indicates that the RPD was not calculated.

Value was above the data quality objective of ≤ 30% Relative Percent Difference (RPD).

Notes: LRL = Laboratory Reporting Limit. If one result in a duplicate pair was below the LRL, RPD was calculated using the LRL in place of the value below detection results. RPD was not calculated if both results were < LRL. "-" indicates that the RPD was not calculated.

Average								0.77	8.11	0.27	4.75

Note: "-" indicates data not collected.

Table B.15: Benthic Invertebrate Community Sorting Efficiency, EVO LAEMP, 2022

Sample ID	Laboratory ID	Number of Organisms Recovered (Initial Sort)	Number of Organisms in Re-sort	Sorting Efficiency (%)
RG_MI3_BIC-1_2022-09-12_N	CC231072	328	1	99.7
RG_MIDBO_BIC-1_2022-09-13_N	CC231075	362	11	97.0
RG_ALUSM_BIC-2_2022-09-18_N	CC231082	328	2	99.3
Average				98.7

Table B.16: Percent Benthic Invertebrate Community Organism Recovery^a, EVO LAEMP, 2022

Sample ID	Laboratory ID	Percent Sampled (%)	Taxa Identified	TIR (%)	PDE (%)	PTD (%)	BCDI
RG_BOCK_BIC-2_2022-09-15_N	CC231067	5	357	0	0.140	0.560	0.004
RG_MI3_BIC-1_2022-09-12_N	CC231072	6	326	0	0.306	0.915	0.006
RG_MICOMP_BIC-2_2022-09-18_N	CC231088	5	315	0	0.316	0.946	0.006

Notes: TIR = Total Identification Error Rate, PDE = Percent Difference in Enumeration, PTD = Percent Taxonomic Disagreement, BCDI = Bray Curtis Dissimilarity Index to quantify differences in identifications.

^a For error rationale and calculations, refer to Cordillera report (Appendix H).

Table B.17: Laboratory Reporting Limit (LRL) Evaluation for Benthic Invertebrate Tissue Chemistry Analyses, EVO LAEMP, 2022

Parameter	Range of LRLs	No. Sample Results <LRL
Antimony	0.002 to 0.096	3 (0.73%)
Arsenic	0.318 to 0.486	38 (9.23%)
Mercury	0.018 to 0.122	76 (18.5%)
Tin	0.01 to 0.041	1 (0.24%)

Notes: "-" = no applicable guideline exists; LRL = Laboratory Reporting Limit; dw = dry weight. Only analytes with at least one sample results < LRL are displayed. Total number of samples in 2022 was 411. The only guideline that exists for benthic invertebrate tissue is for selenium and all LRLs for selenium were below the applicable guideline.

Table B.18: Laboratory Reporting Limit (LRL) Evaluation for Periphyton and Bryophyte Tissue Chemistry Analyses, EVO LAEMP, 2022

Parameter	Unit	Range of LRLs	No. Sample Results <LRL
Arsenic	mg/kg	0.01 to 1.82	3 (0.66%)
Beryllium	mg/kg	0.01 to 0.846	6 (1.60%)
Bismuth	mg/kg	0.01 to 0.846	96 (25.5%)
Boron	mg/kg	0.01 to 84.6	1 (0.22%)
Cesium	mg/kg	0.005 to 170	1 (0.27%)
Chromium	mg/kg	0.005 to 12.1	1 (0.22%)
Copper	mg/kg	0.015 to 12.1	1 (0.22%)
Lithium	mg/kg	0.01 to 42.3	4 (0.89%)
Mercury	mg/kg	0.03	29 (38.7%)
Sodium	mg/kg	0.1 to 1690	4 (0.887%)
Tellurium	mg/kg	0.02 to 1.69	282 (75.0%)
Tin	mg/kg	0.002 to 8.46	191 (42.4%)
Zirconium	mg/kg	0.2 to 16.9	6 (1.60%)

Notes: LRL = Laboratory Reporting Limit. Only analytes with at least one sample results < LRL are displayed. No applicable guidelines exist for any analyte that had at least one result below the LRL. The total number of samples in 2022 was 376; however, mercury, silver, and titanium were only measured in the 65 samples that were analyzed by Trich Analytics.

Table B.19: Laboratory Reporting Limit (LRL) Evaluation for Periphyton Productivity Analyses, EVO LAEMP, 2022

Parameter	Units	Range of LRLs	No. Sample Results <LRL
Ash Free Dry Weight	g	0.001	1 (11.1%)

Notes: "-" = no applicable guideline exists; LRL = Laboratory Reporting Limit. Only analytes with at least one sample results < LRL are displayed. The total number of samples collected in 2022 was nine.

APPENDIX C
PHYSICAL HABITAT

Table C.1: Summary of Maximum Daily Temperature Exceedances in Erickson Creek (RG_ERCK), EVO LAEMP, 2022

Month	Threshold	Logger 1			Logger 2			Logger 3		
		Number of Days	Number of Days Exceeding Threshold	Number of Days Exceeding Threshold (%)	Number of Days	Number of Days Exceeding Threshold	Number of Days Exceeding Threshold (%)	Number of Days	Number of Days Exceeding Threshold	Number of Days Exceeding Threshold (%)
January	7	31	0	0	31	0	0	-	-	-
February	7	28	0	0	28	0	0	-	-	-

APPENDIX D
WATER QUALITY AND SEDIMENT CHEMISTRY

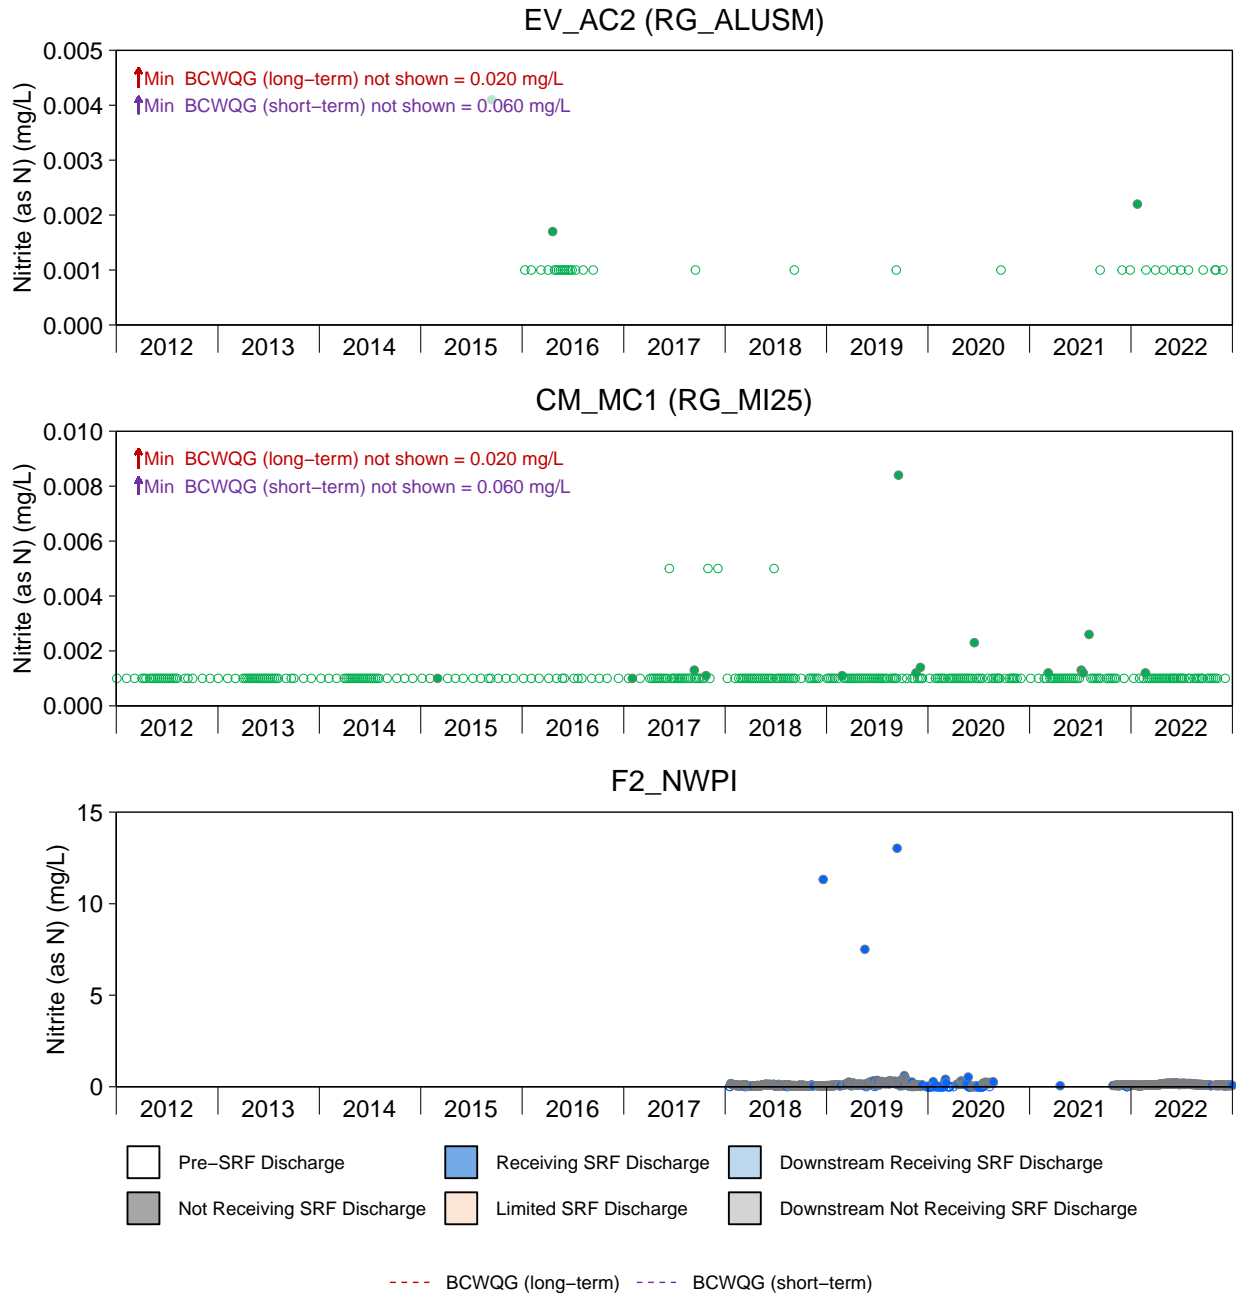

Figure D.1: Time Series Plots for Nitrite from EVO LAEMP Areas, 2012 to 2022

Notes: Concentrations reported below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL. Guidelines are dependent on water chloride concentrations. Constituent was plotted because it was identified as a mine-related constituent in the Adaptive Management Plan and an early warning trigger was defined (Azimuth 2018). When biological monitoring areas and routine water quality stations were in close proximity to each other and with no additional inputs between them, data collected at the biological monitoring area were combined with routine data and plotted together with the biological monitoring area depicted in parenthesis.

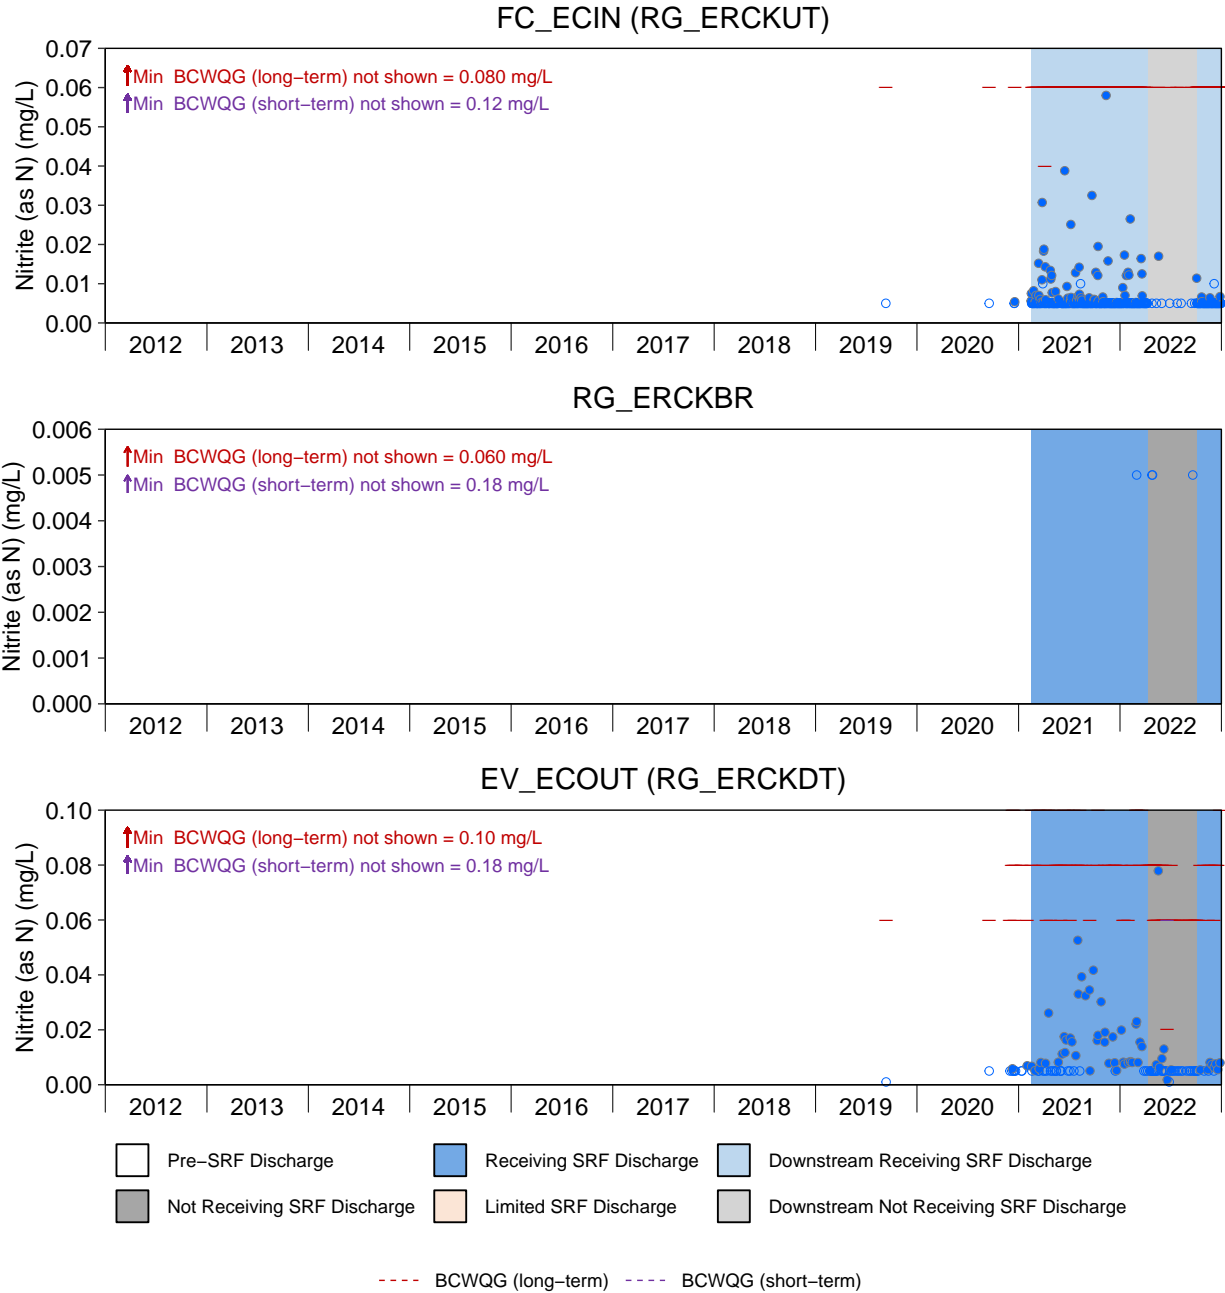

Figure D.1: Time Series Plots for Nitrite from EVO LAEMP Areas, 2012 to 2022

Notes: Concentrations reported below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL. Guidelines are dependent on water chloride concentrations. Constituent was plotted because it was identified as a mine-related constituent in the Adaptive Management Plan and an early warning trigger was defined (Azimuth 2018). When biological monitoring areas and routine water quality stations were in close proximity to each other and with no additional inputs between them, data collected at the biological monitoring area were combined with routine data and plotted together with the biological monitoring area depicted in parenthesis.

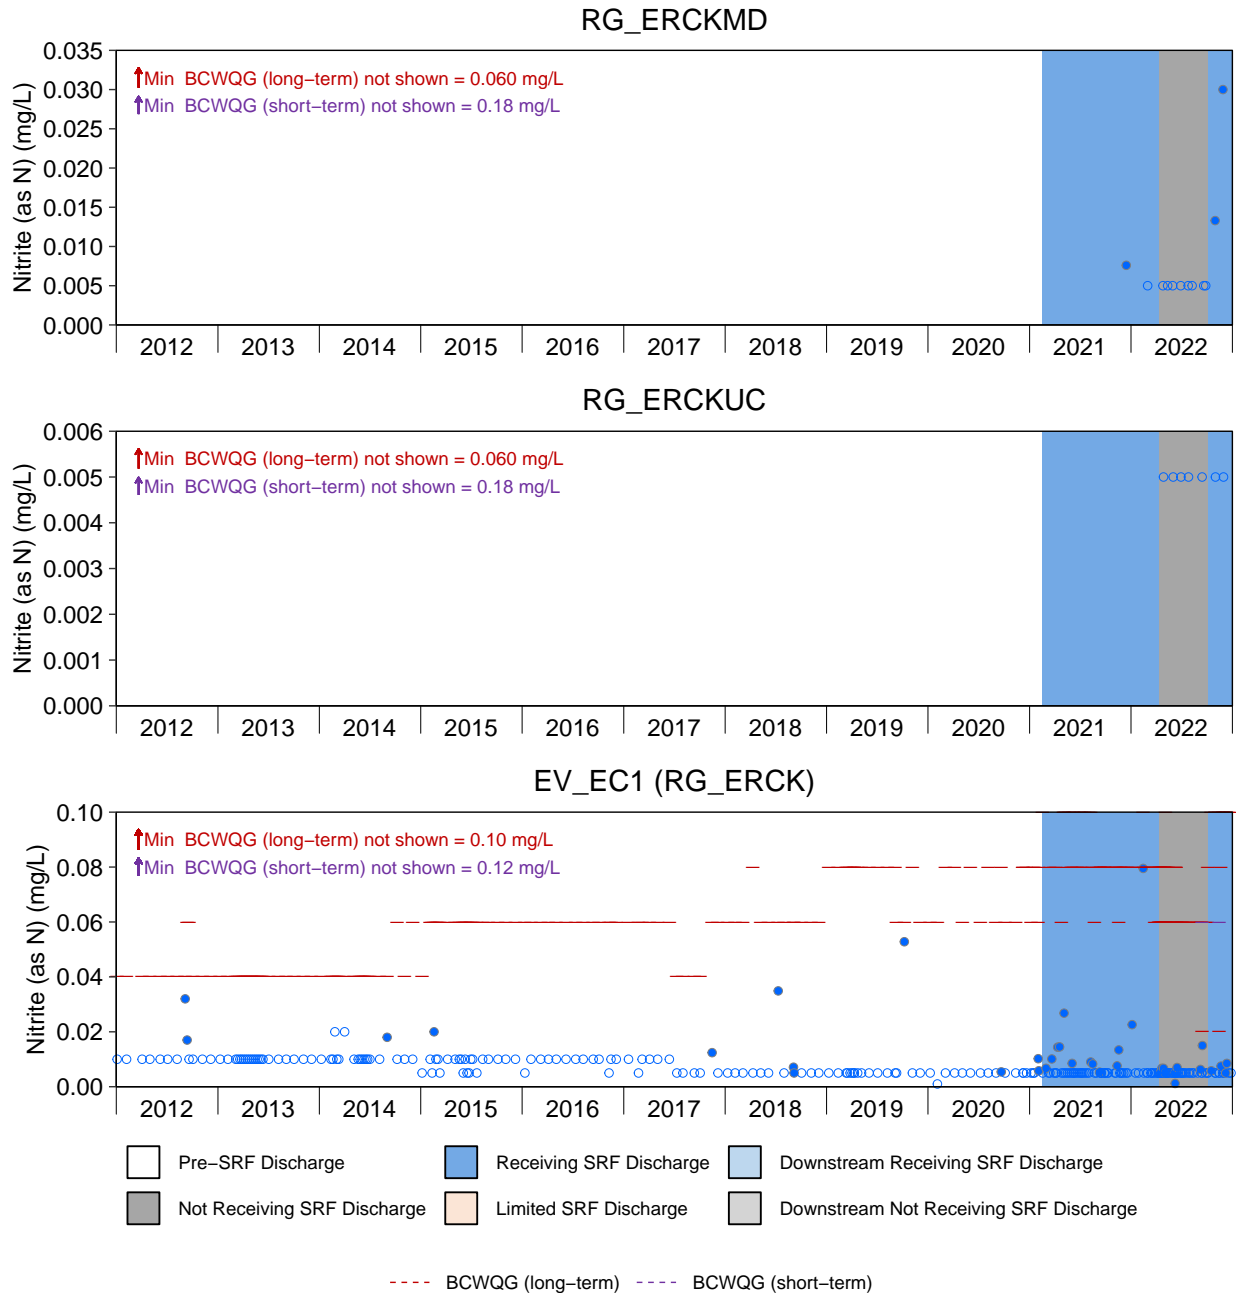

Figure D.1: Time Series Plots for Nitrite from EVO LAEMP Areas, 2012 to 2022

Notes: Concentrations reported below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL. Guidelines are dependent on water chloride concentrations. Constituent was plotted because it was identified as a mine-related constituent in the Adaptive Management Plan and an early warning trigger was defined (Azimuth 2018). When biological monitoring areas and routine water quality stations were in close proximity to each other and with no additional inputs between them, data collected at the biological monitoring area were combined with routine data and plotted together with the biological monitoring area depicted in parenthesis.

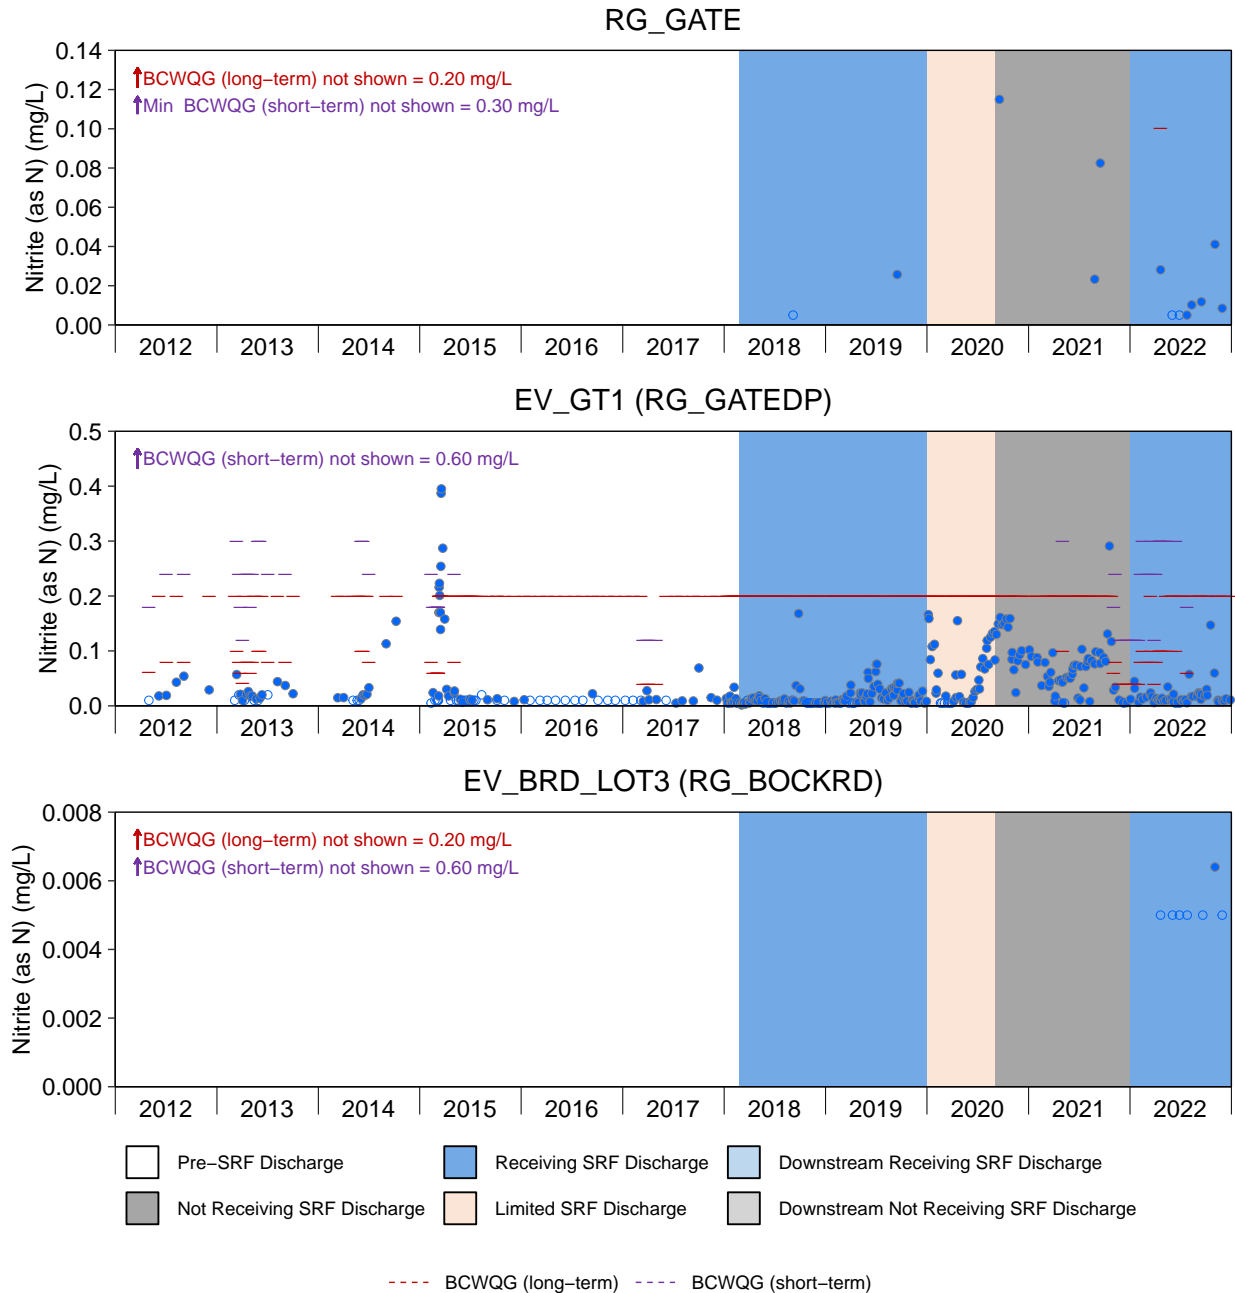

Figure D.1: Time Series Plots for Nitrite from EVO LAEMP Areas, 2012 to 2022

Notes: Concentrations reported below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL. Guidelines are dependent on water chloride concentrations. Constituent was plotted because it was identified as a mine-related constituent in the Adaptive Management Plan and an early warning trigger was defined (Azimuth 2018). When biological monitoring areas and routine water quality stations were in close proximity to each other and with no additional inputs between them, data collected at the biological monitoring area were combined with routine data and plotted together with the biological monitoring area depicted in parenthesis.

Notes: Concentrations reported below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL. Constituent was plotted because it was identified as a mine-related constituent in the Adaptive Management Plan and an early warning trigger was defined (Azimuth 2018).

Figure D.11: Time Series Plots for Total Nickel from EVO LAEMP Areas, 2012 to 2022

Notes: Concentrations reported below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL. Constituent was plotted because it was identified as a mine-related constituent in the Adaptive Management Plan and an early warning trigger was defined (Azimuth 2018).

Figure D.11: Time Series Plots for Total Nickel from EVO LAEMP Areas, 2012 to 2022

Notes: Concentrations reported below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL. Constituent was plotted because it was identified as a mine-related constituent in the Adaptive Management Plan and an early warning trigger was defined (Azimuth 2018).

Figure D.11: Time Series Plots for Total Nickel from EVO LAEMP Areas, 2012 to 2022

Notes: Concentrations reported below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL. Constituent was plotted because it was identified as a mine-related constituent in the Adaptive Management Plan and an early warning trigger was defined (Azimuth 2018).

Figure D.11: Time Series Plots for Total Nickel from EVO LAEMP Areas, 2012 to 2022

Notes: Concentrations reported below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL. Constituent was plotted because it was identified as a mine-related constituent in the Adaptive Management Plan and an early warning trigger was defined (Azimuth 2018).

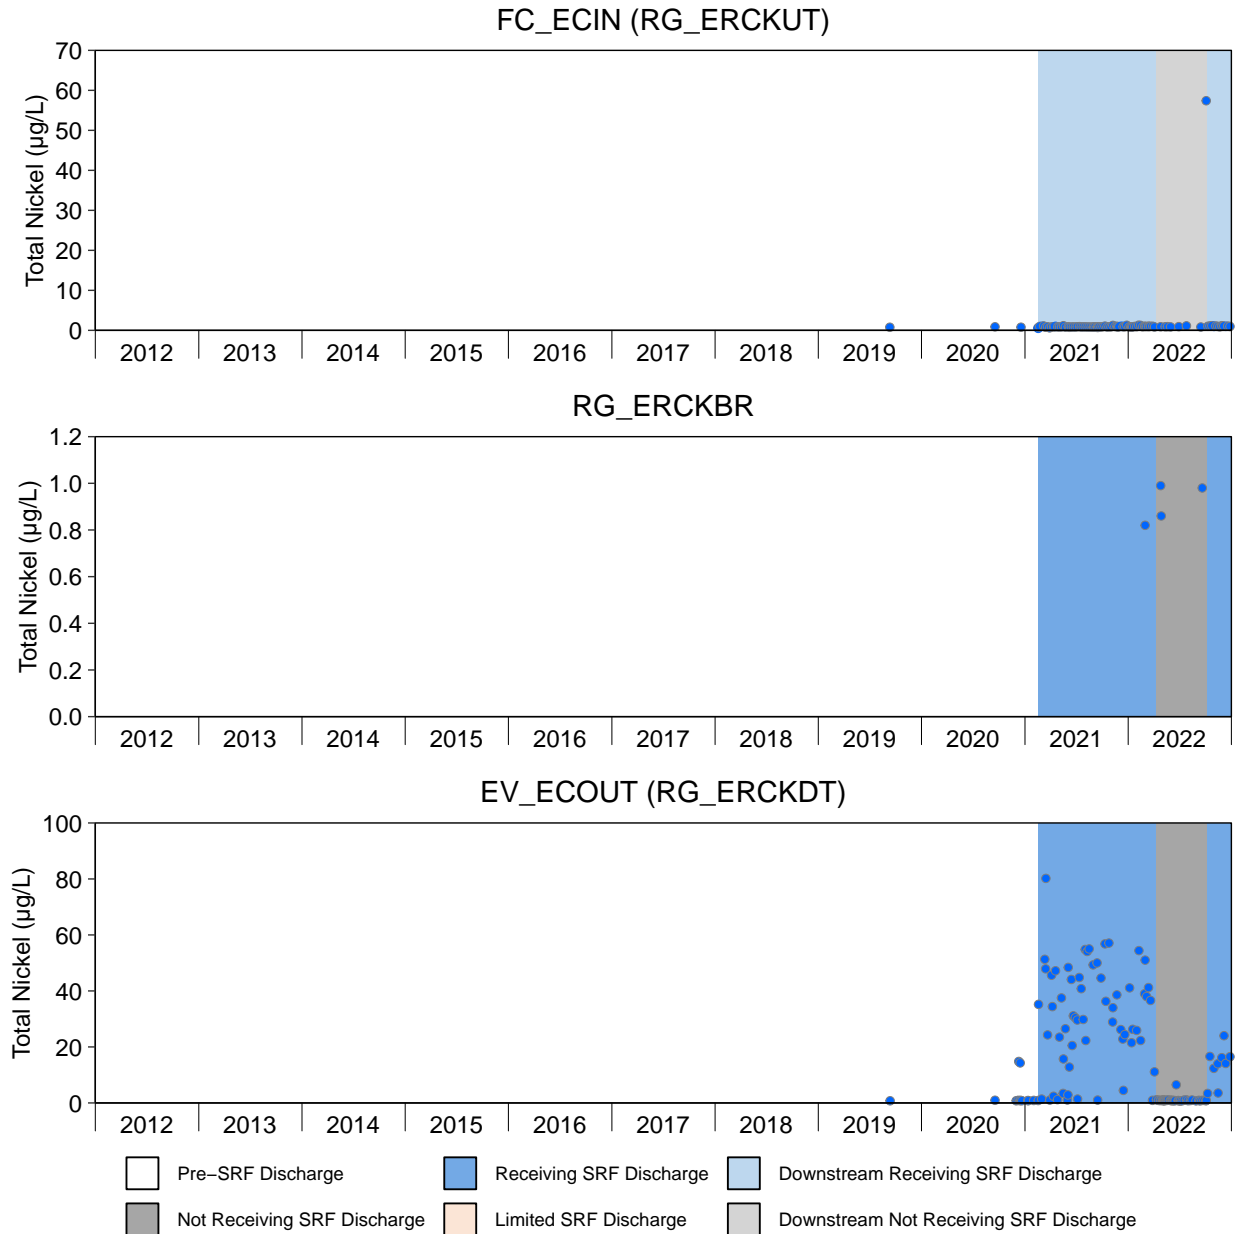

Figure D.11: Time Series Plots for Total Nickel from EVO LAEMP Areas, 2012 to 2022

Notes: Concentrations reported below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL. Constituent was plotted because it was identified as a mine-related constituent in the Adaptive Management Plan and an early warning trigger was defined (Azimuth 2018).

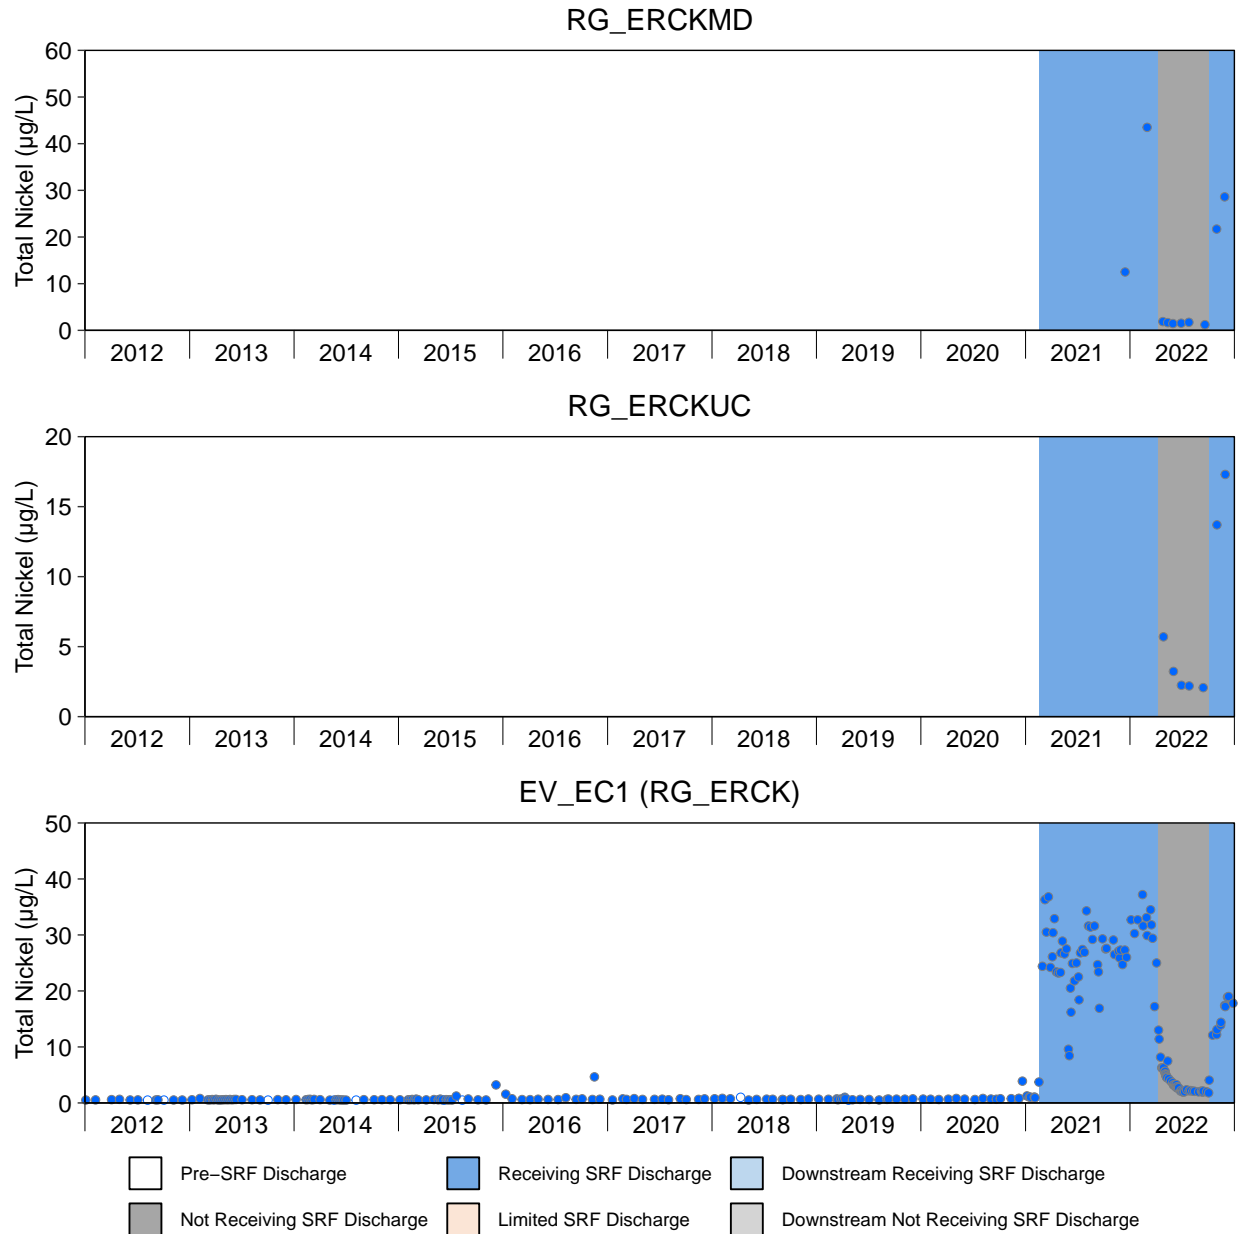

Figure D.11: Time Series Plots for Total Nickel from EVO LAEMP Areas, 2012 to 2022

Notes: Concentrations reported below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL. Constituent was plotted because it was identified as a mine-related constituent in the Adaptive Management Plan and an early warning trigger was defined (Azimuth 2018).

Figure D.12: Time Series Plots for Total Zinc from EVO LAEMP Areas, 2012 to 2022

Notes: Concentrations reported below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL. Guidelines are dependent on water hardness. Constituent was plotted because it was identified as a mine-related constituent in the Adaptive Management Plan and an early warning trigger was defined (Azimuth 2018).

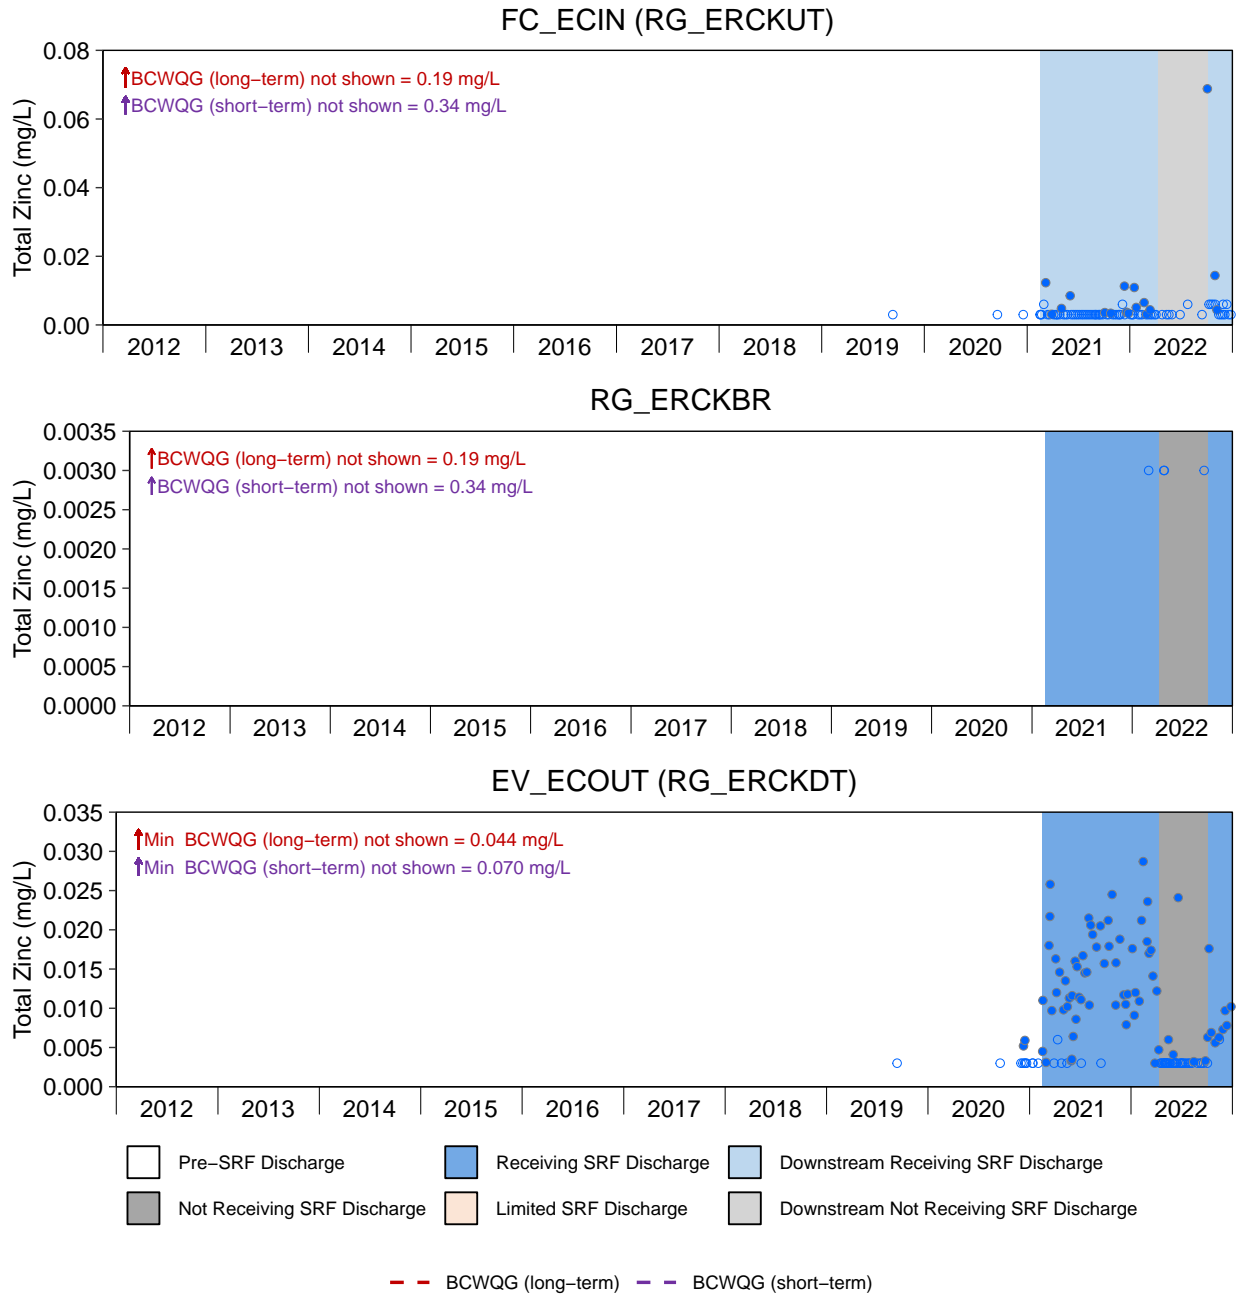

Figure D.12: Time Series Plots for Total Zinc from EVO LAEMP Areas, 2012 to 2022

Notes: Concentrations reported below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL. Guidelines are dependent on water hardness. Constituent was plotted because it was identified as a mine-related constituent in the Adaptive Management Plan and an early warning trigger was defined (Azimuth 2018).

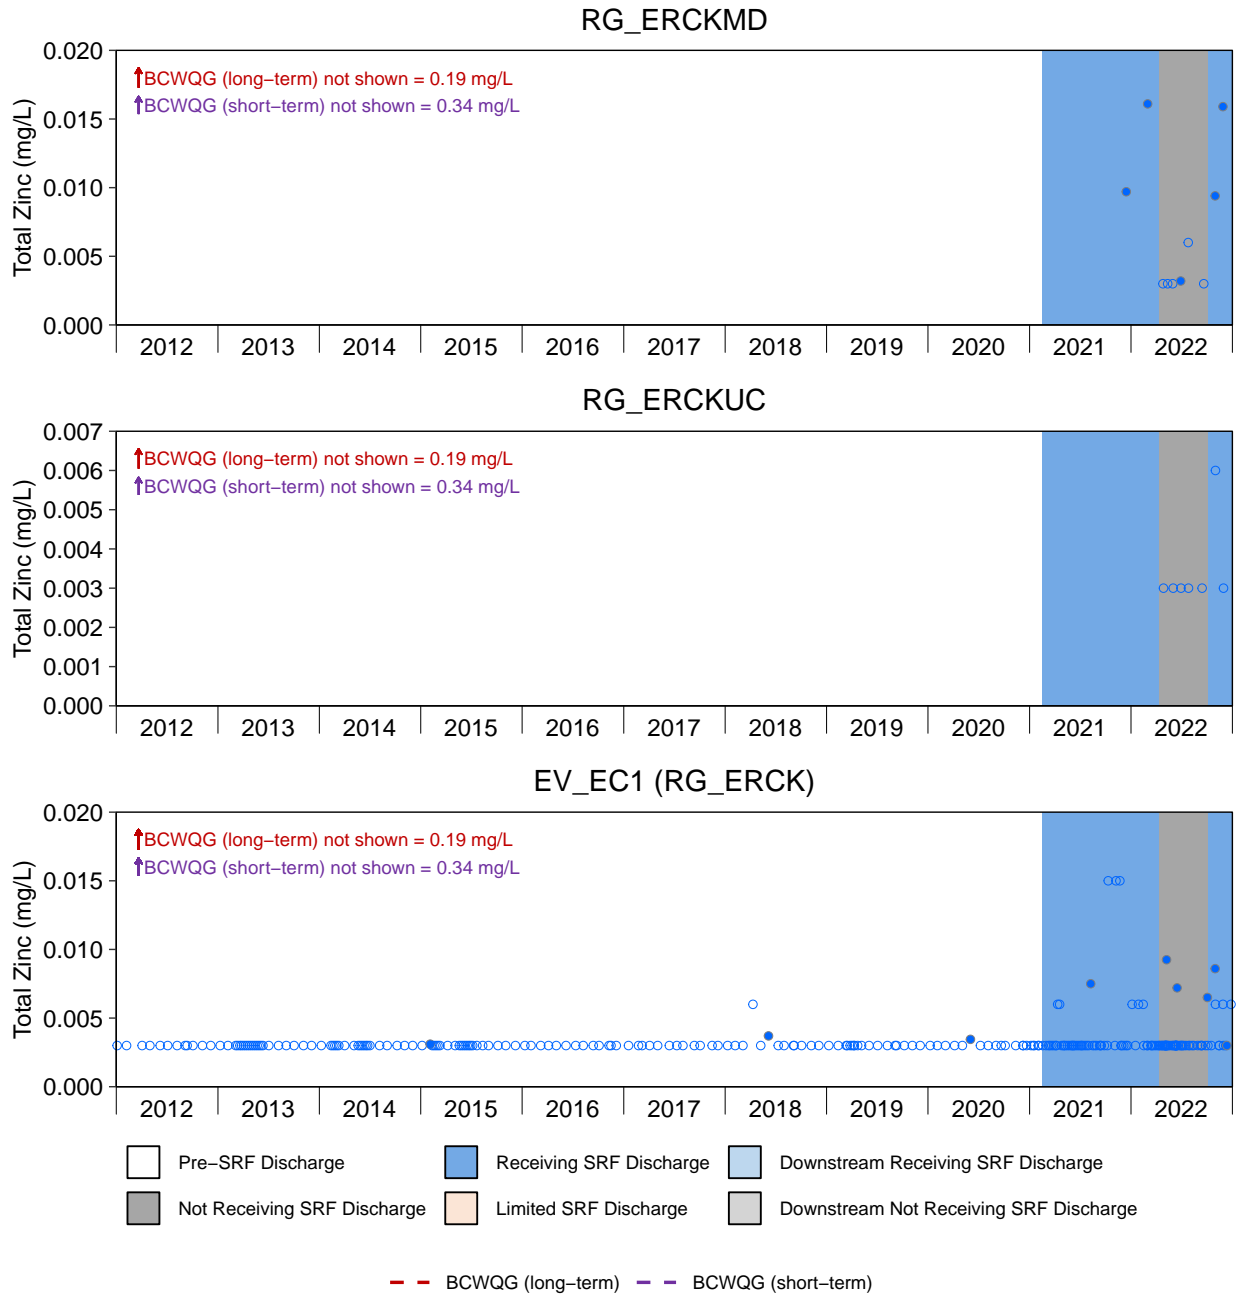

Figure D.12: Time Series Plots for Total Zinc from EVO LAEMP Areas, 2012 to 2022

Notes: Concentrations reported below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL. Guidelines are dependent on water hardness. Constituent was plotted because it was identified as a mine-related constituent in the Adaptive Management Plan and an early warning trigger was defined (Azimuth 2018).

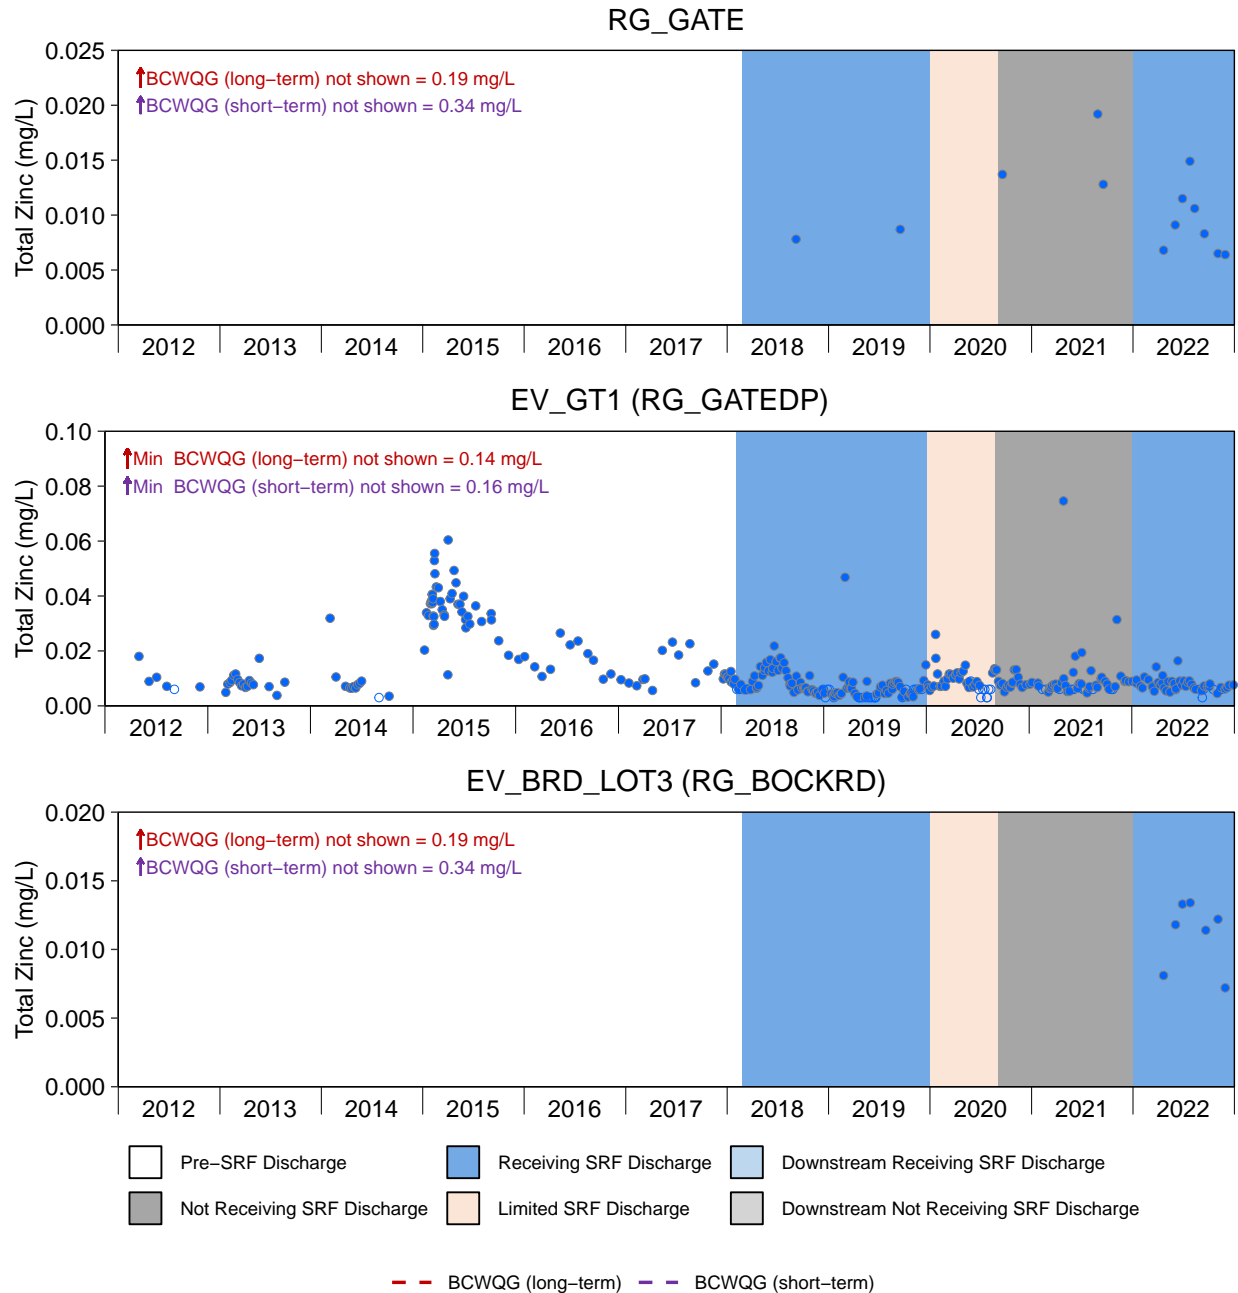

Figure D.12: Time Series Plots for Total Zinc from EVO LAEMP Areas, 2012 to 2022

Notes: Concentrations reported below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL. Guidelines are dependent on water hardness. Constituent was plotted because it was identified as a mine-related constituent in the Adaptive Management Plan and an early warning trigger was defined (Azimuth 2018).

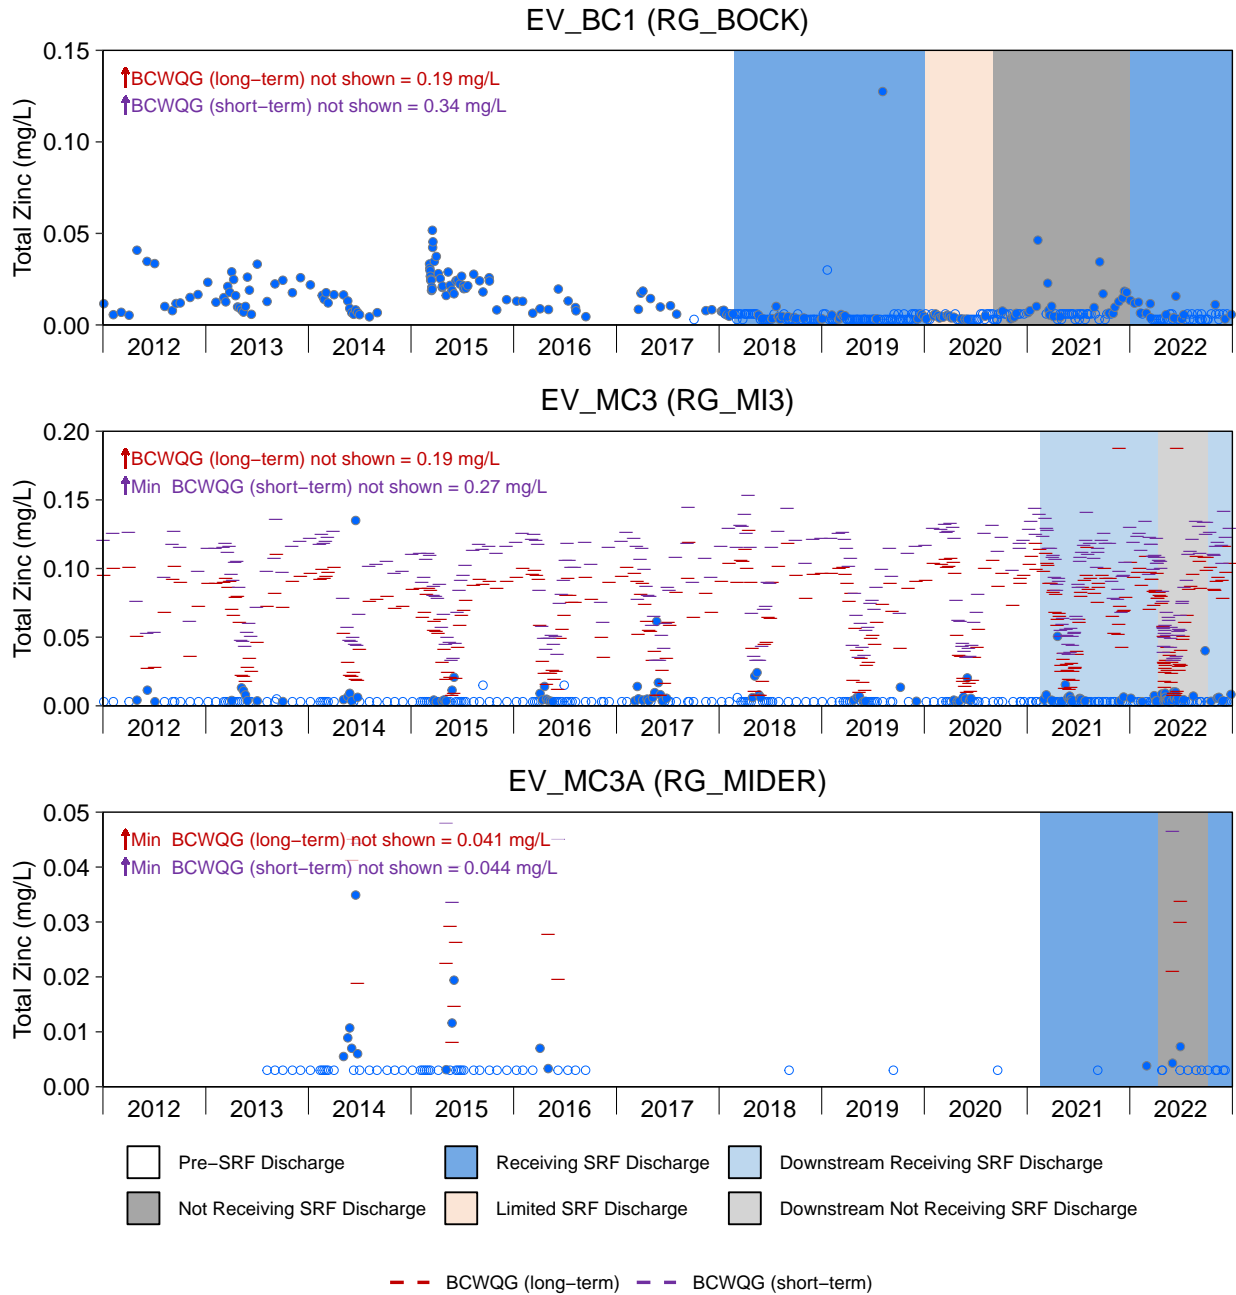

Figure D.12: Time Series Plots for Total Zinc from EVO LAEMP Areas, 2012 to 2022

Notes: Concentrations reported below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL. Guidelines are dependent on water hardness. Constituent was plotted because it was identified as a mine-related constituent in the Adaptive Management Plan and an early warning trigger was defined (Azimuth 2018).

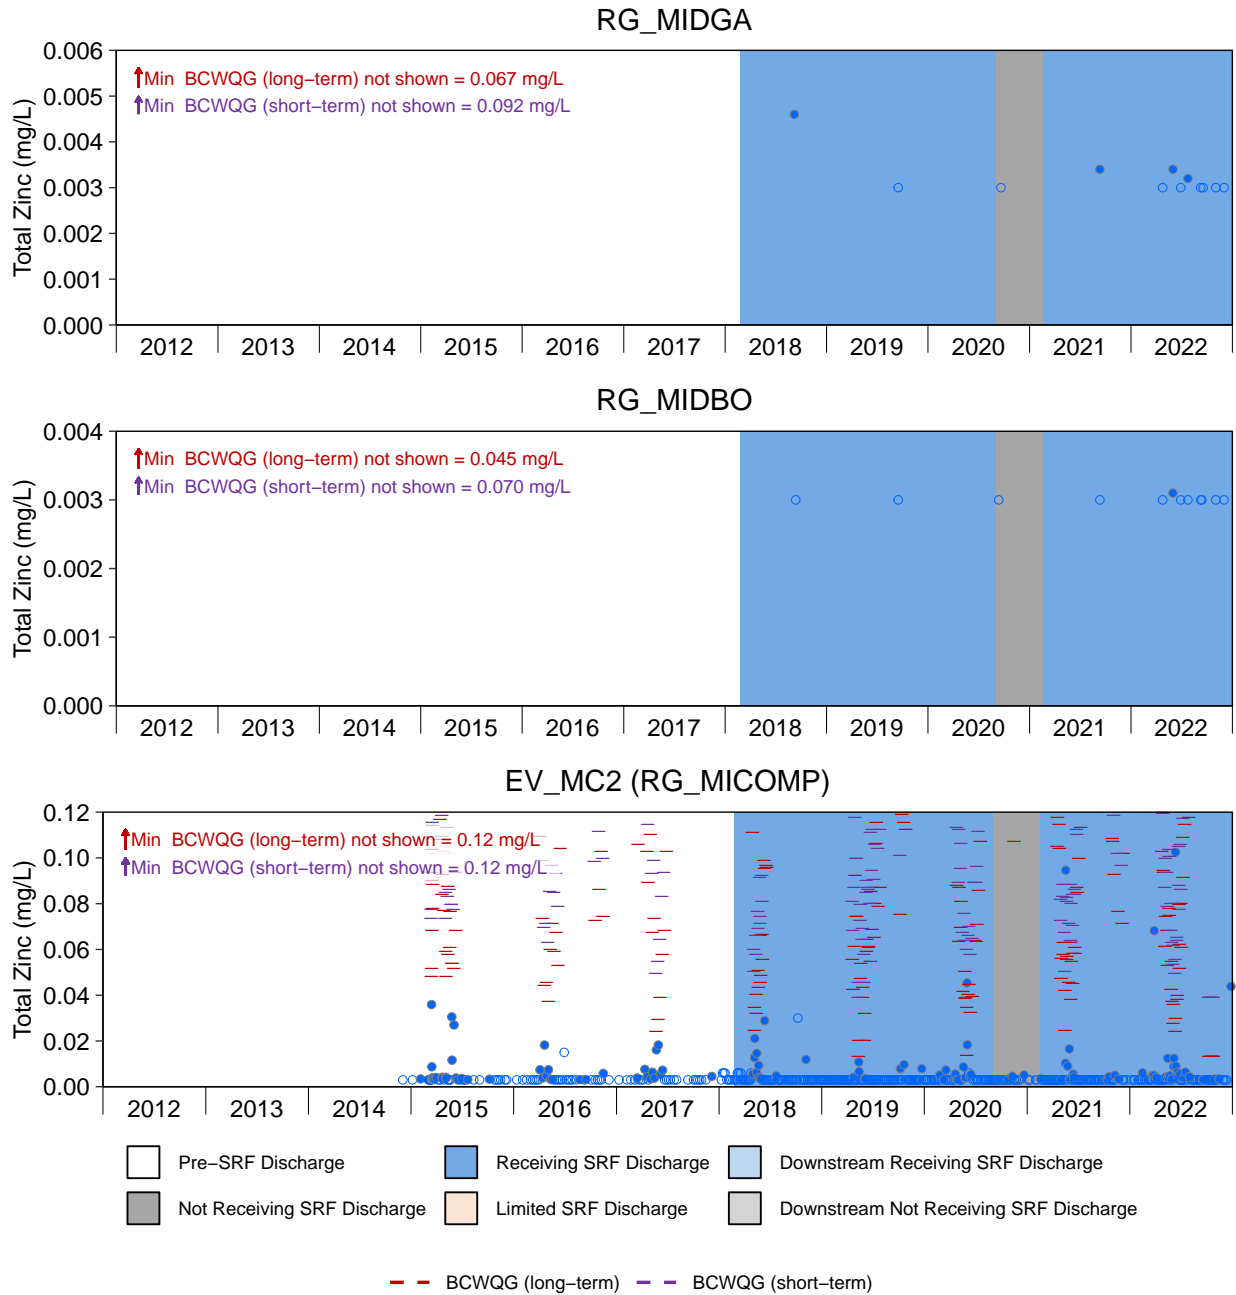

Figure D.12: Time Series Plots for Total Zinc from EVO LAEMP Areas, 2012 to 2022

Notes: Concentrations reported below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL. Guidelines are dependent on water hardness. Constituent was plotted because it was identified as a mine-related constituent in the Adaptive Management Plan and an early warning trigger was defined (Azimuth 2018).

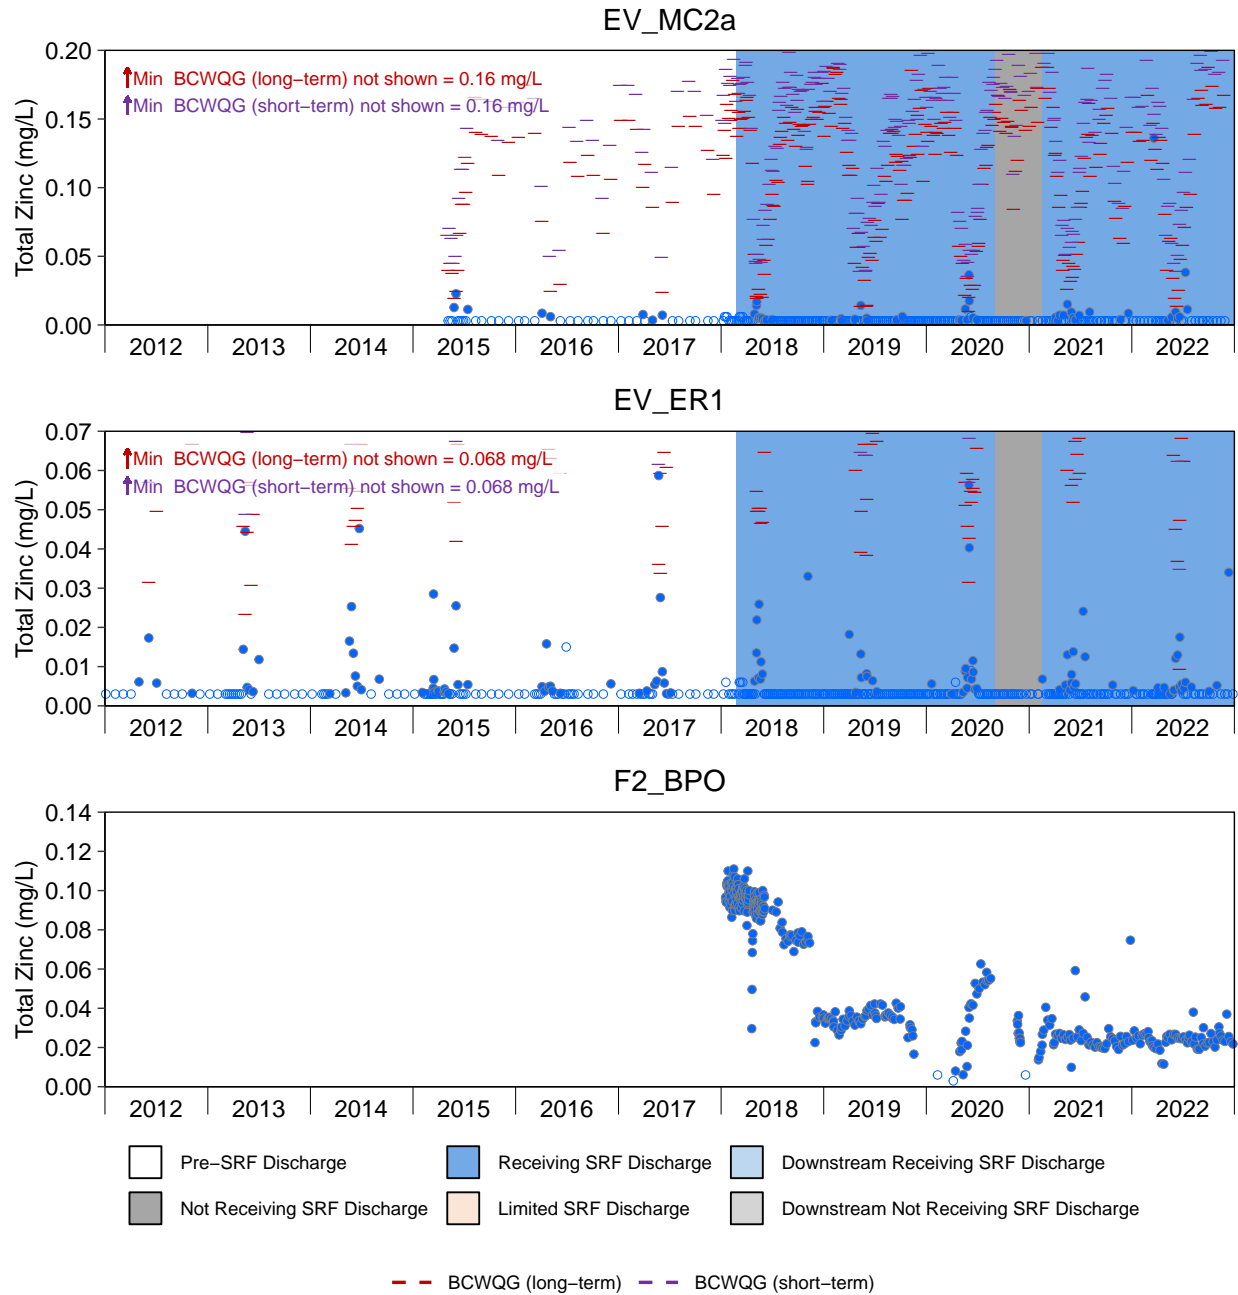

Figure D.12: Time Series Plots for Total Zinc from EVO LAEMP Areas, 2012 to 2022

Notes: Concentrations reported below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL. Guidelines are dependent on water hardness. Constituent was plotted because it was identified as a mine-related constituent in the Adaptive Management Plan and an early warning trigger was defined (Azimuth 2018).

Figure D.13: Time Series Plots for Dissolved Cadmium from EVO LAEMP Areas, 2012 to 2022

Notes: Concentrations reported below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL. Guidelines are dependent on water hardness. Constituent was plotted because it was identified as a mine-related constituent in the Adaptive Management Plan and an early warning trigger was defined (Azimuth 2018).

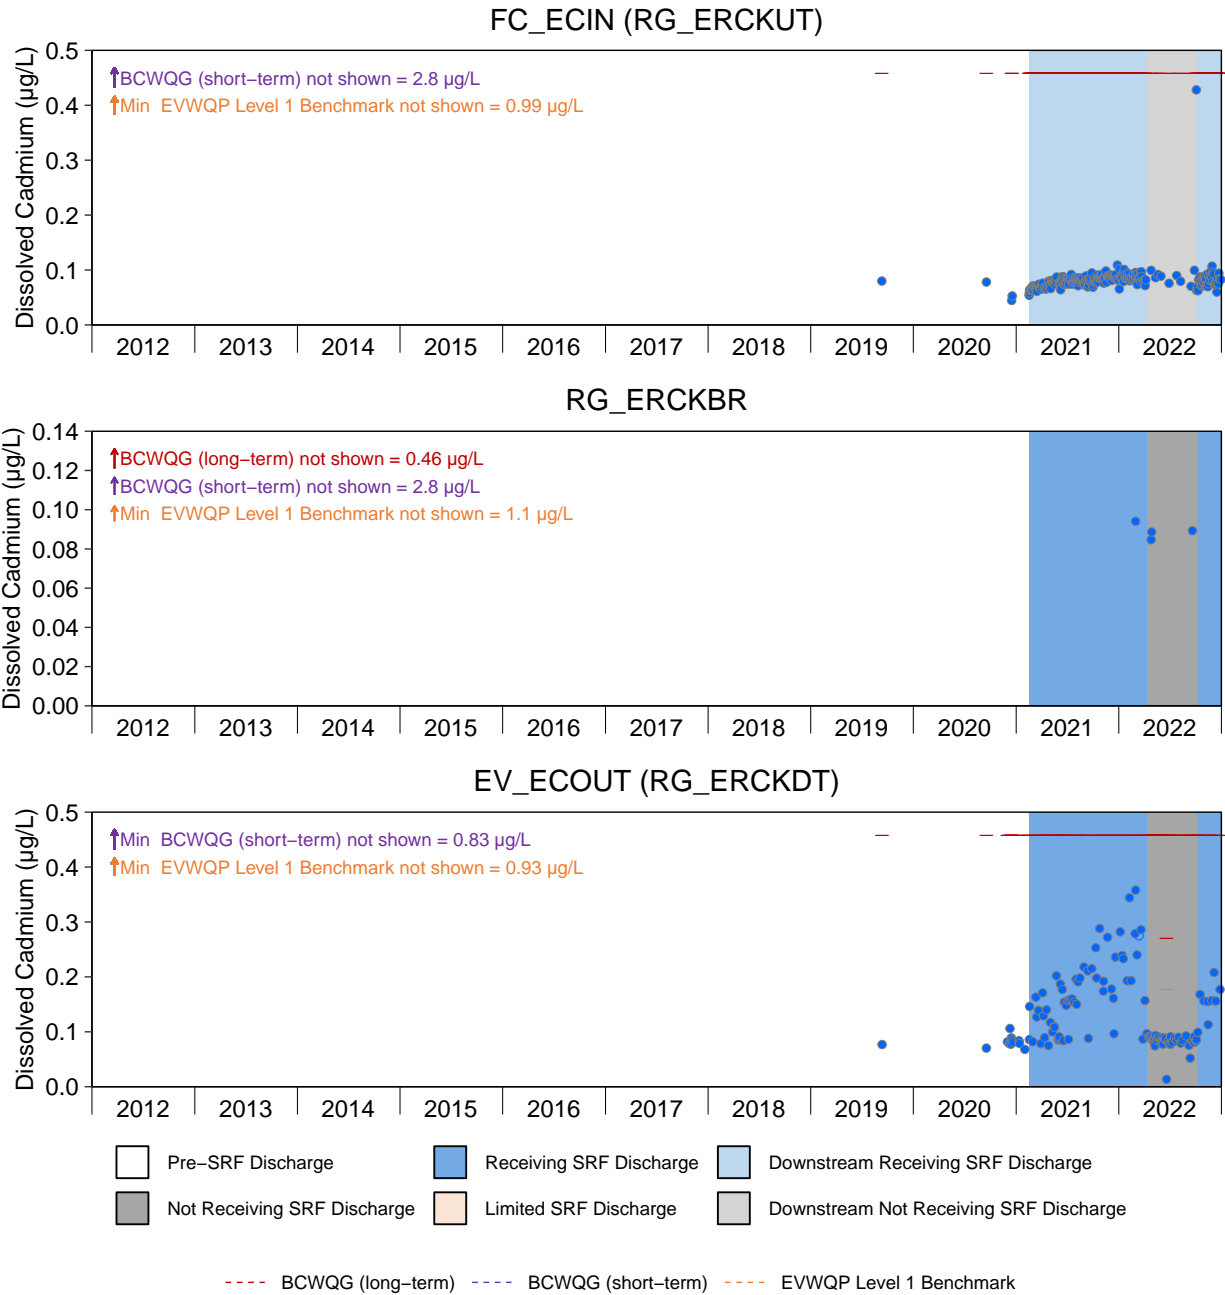

Figure D.13: Time Series Plots for Dissolved Cadmium from EVO LAEMP Areas, 2012 to 2022

Notes: Concentrations reported below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL. Guidelines are dependent on water hardness. Constituent was plotted because it was identified as a mine-related constituent in the Adaptive Management Plan and an early warning trigger was defined (Azimuth 2018).

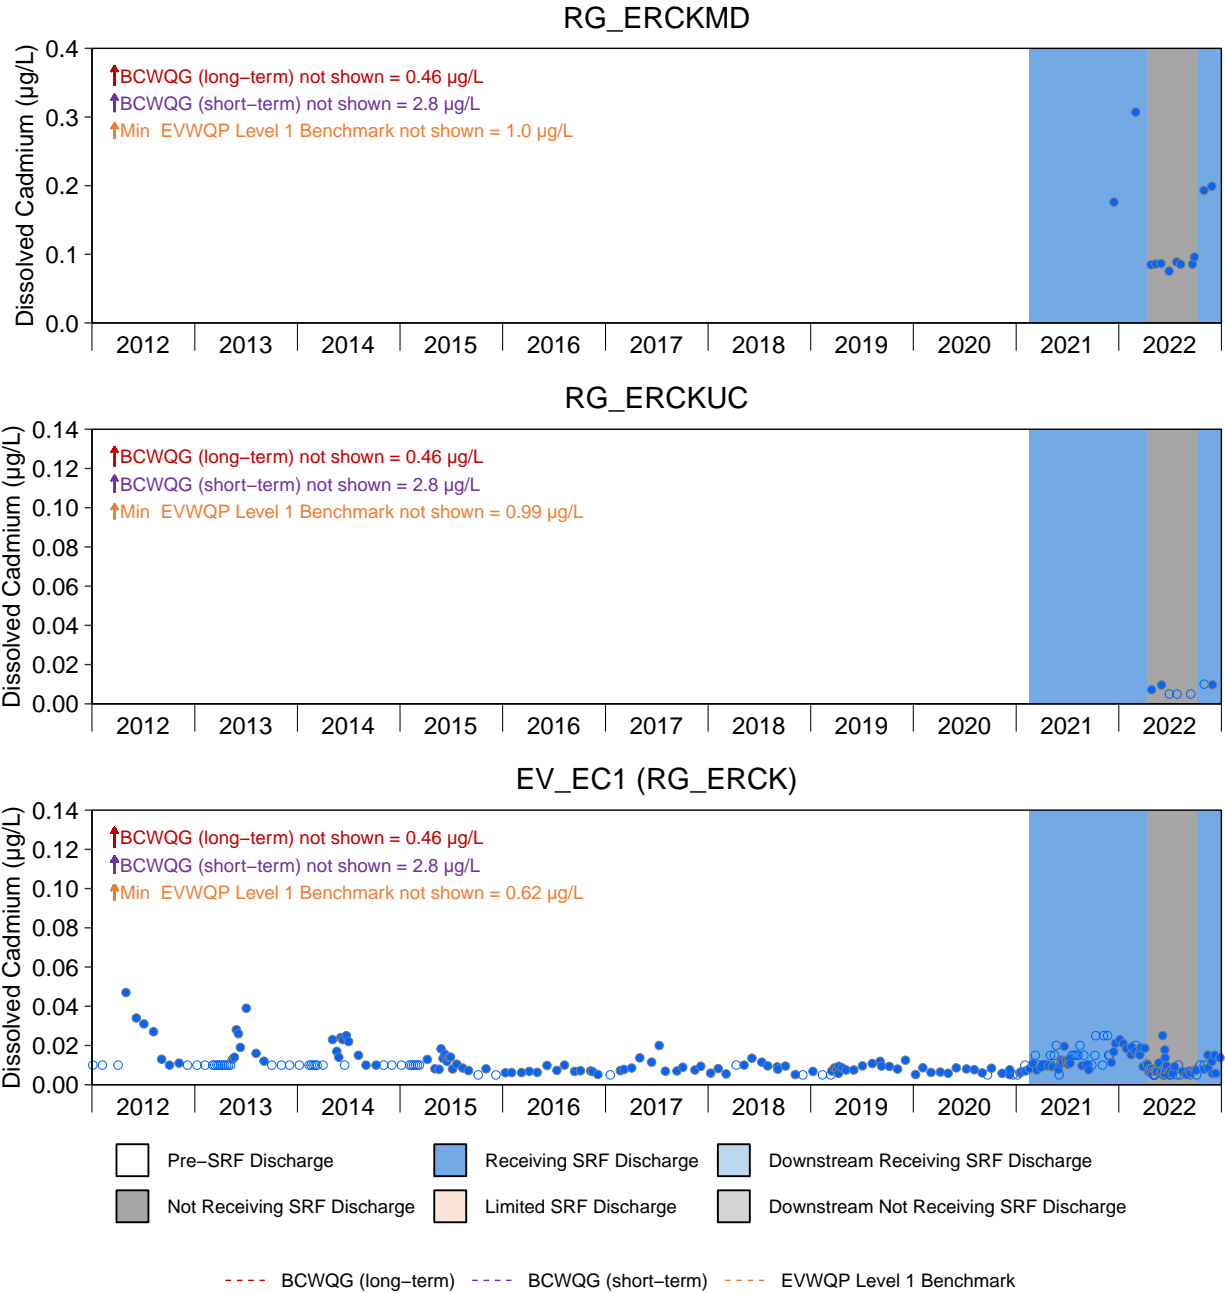

Figure D.13: Time Series Plots for Dissolved Cadmium from EVO LAEMP Areas, 2012 to 2022

Notes: Concentrations reported below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL. Guidelines are dependent on water hardness. Constituent was plotted because it was identified as a mine-related constituent in the Adaptive Management Plan and an early warning trigger was defined (Azimuth 2018).

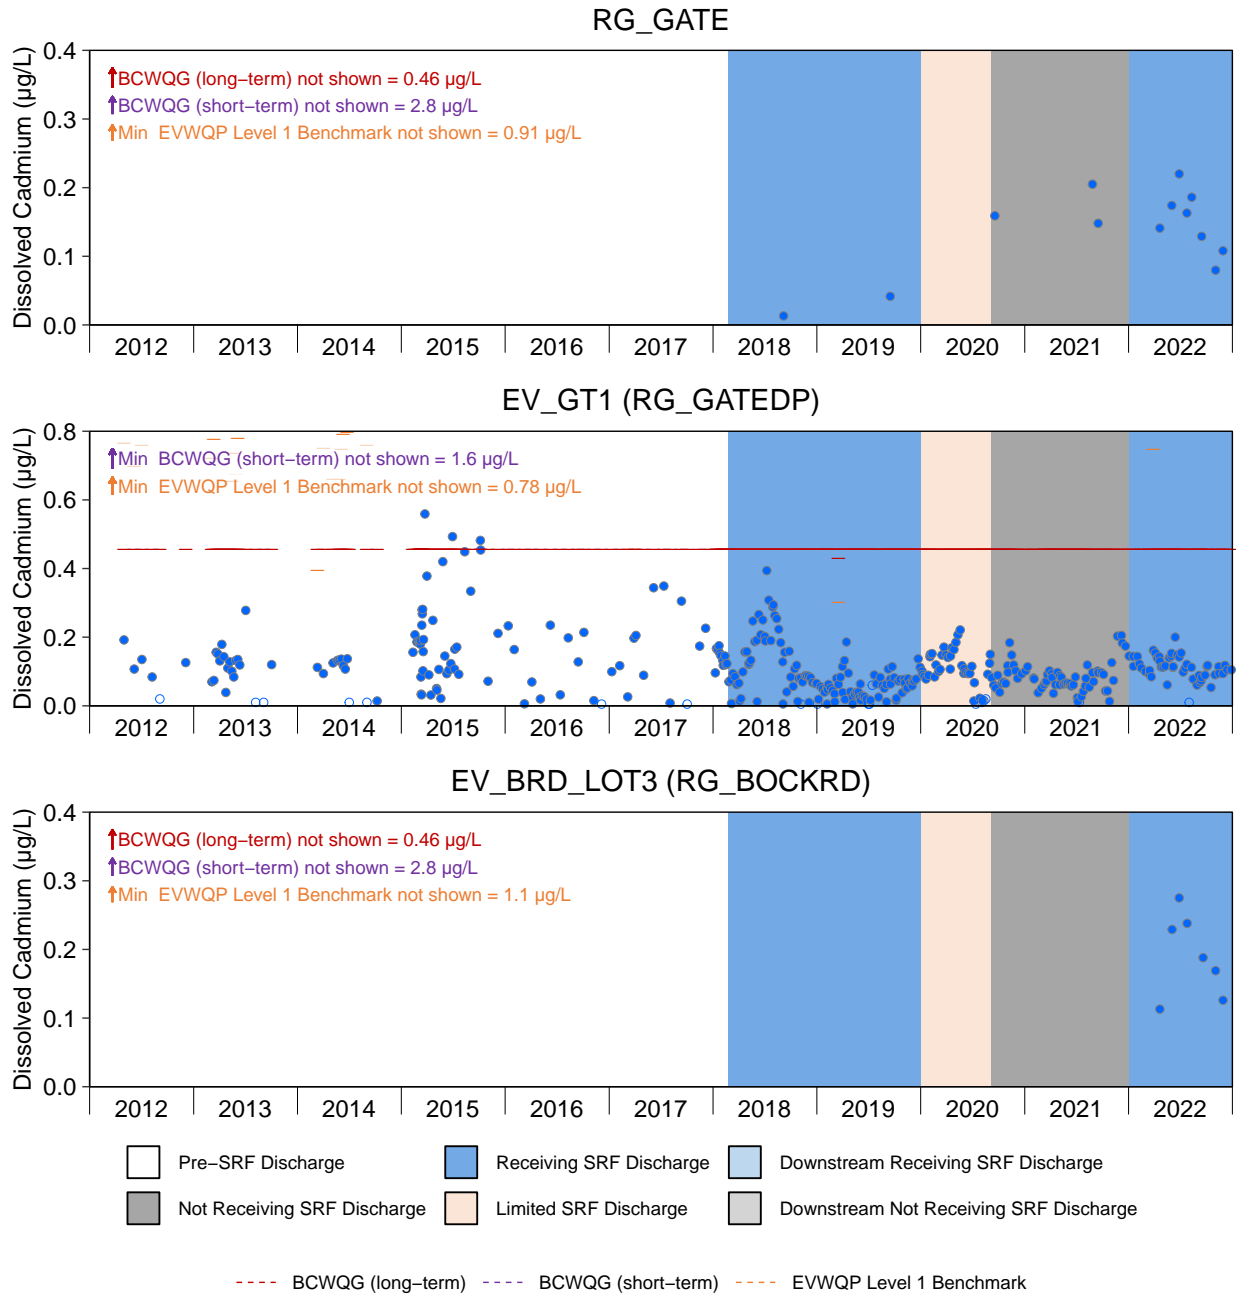

Figure D.13: Time Series Plots for Dissolved Cadmium from EVO LAEMP Areas, 2012 to 2022

Notes: Concentrations reported below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL. Guidelines are dependent on water hardness. Constituent was plotted because it was identified as a mine-related constituent in the Adaptive Management Plan and an early warning trigger was defined (Azimuth 2018).

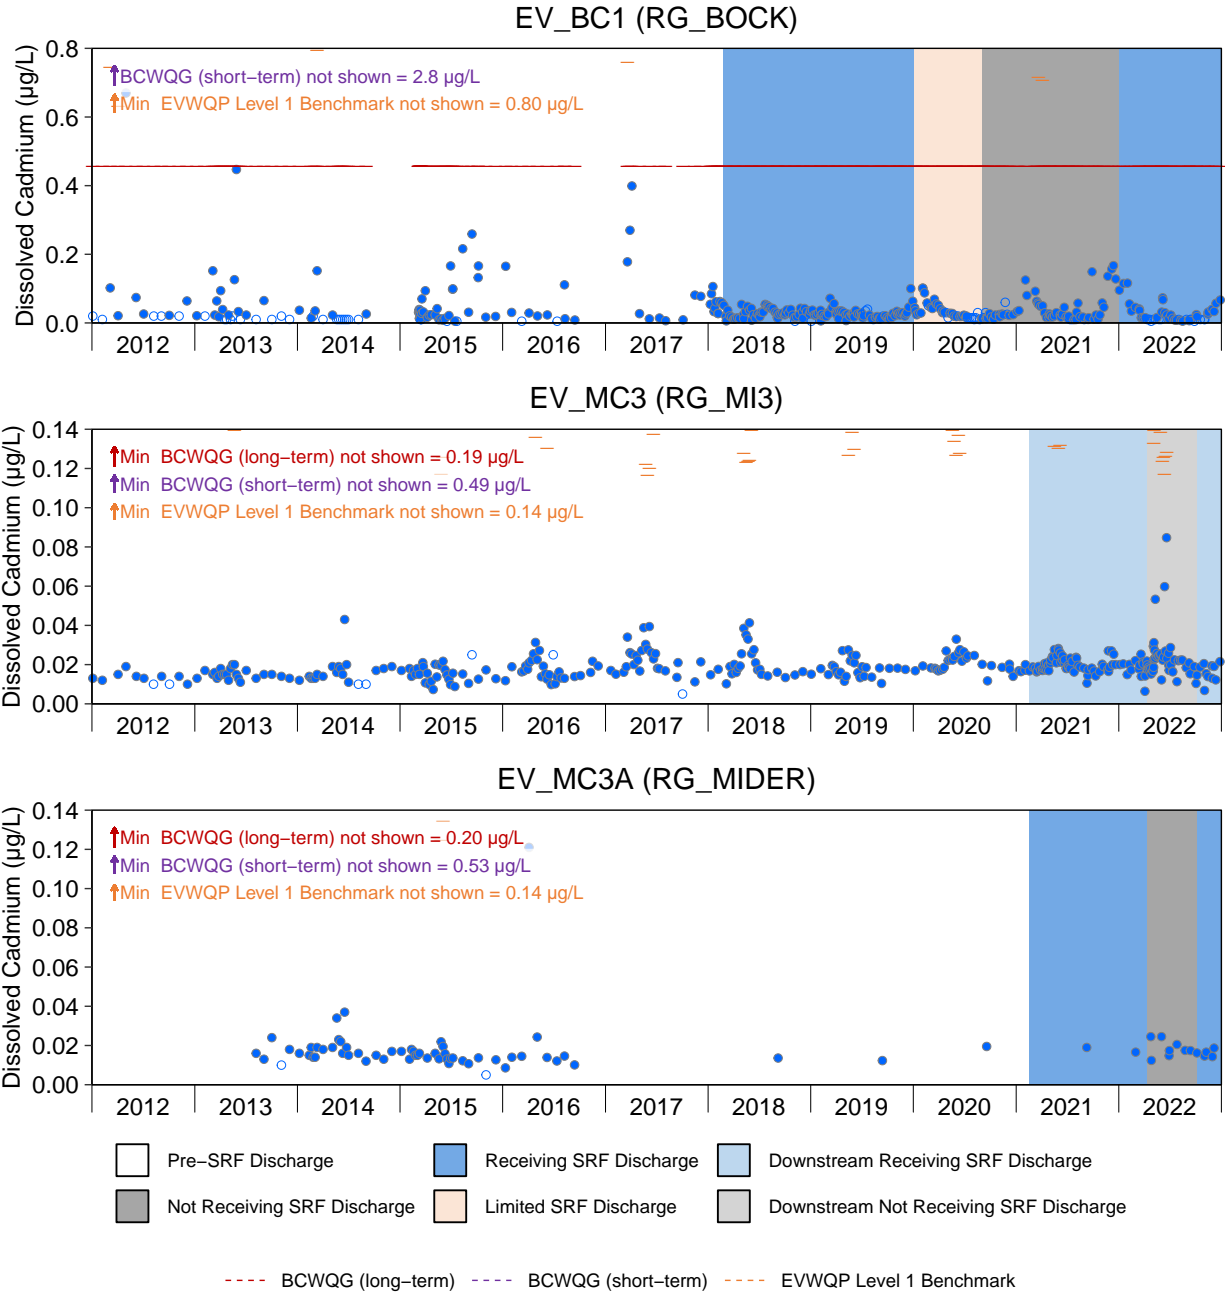

Figure D.13: Time Series Plots for Dissolved Cadmium from EVO LAEMP Areas, 2012 to 2022

Notes: Concentrations reported below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL. Guidelines are dependent on water hardness. Constituent was plotted because it was identified as a mine-related constituent in the Adaptive Management Plan and an early warning trigger was defined (Azimuth 2018).

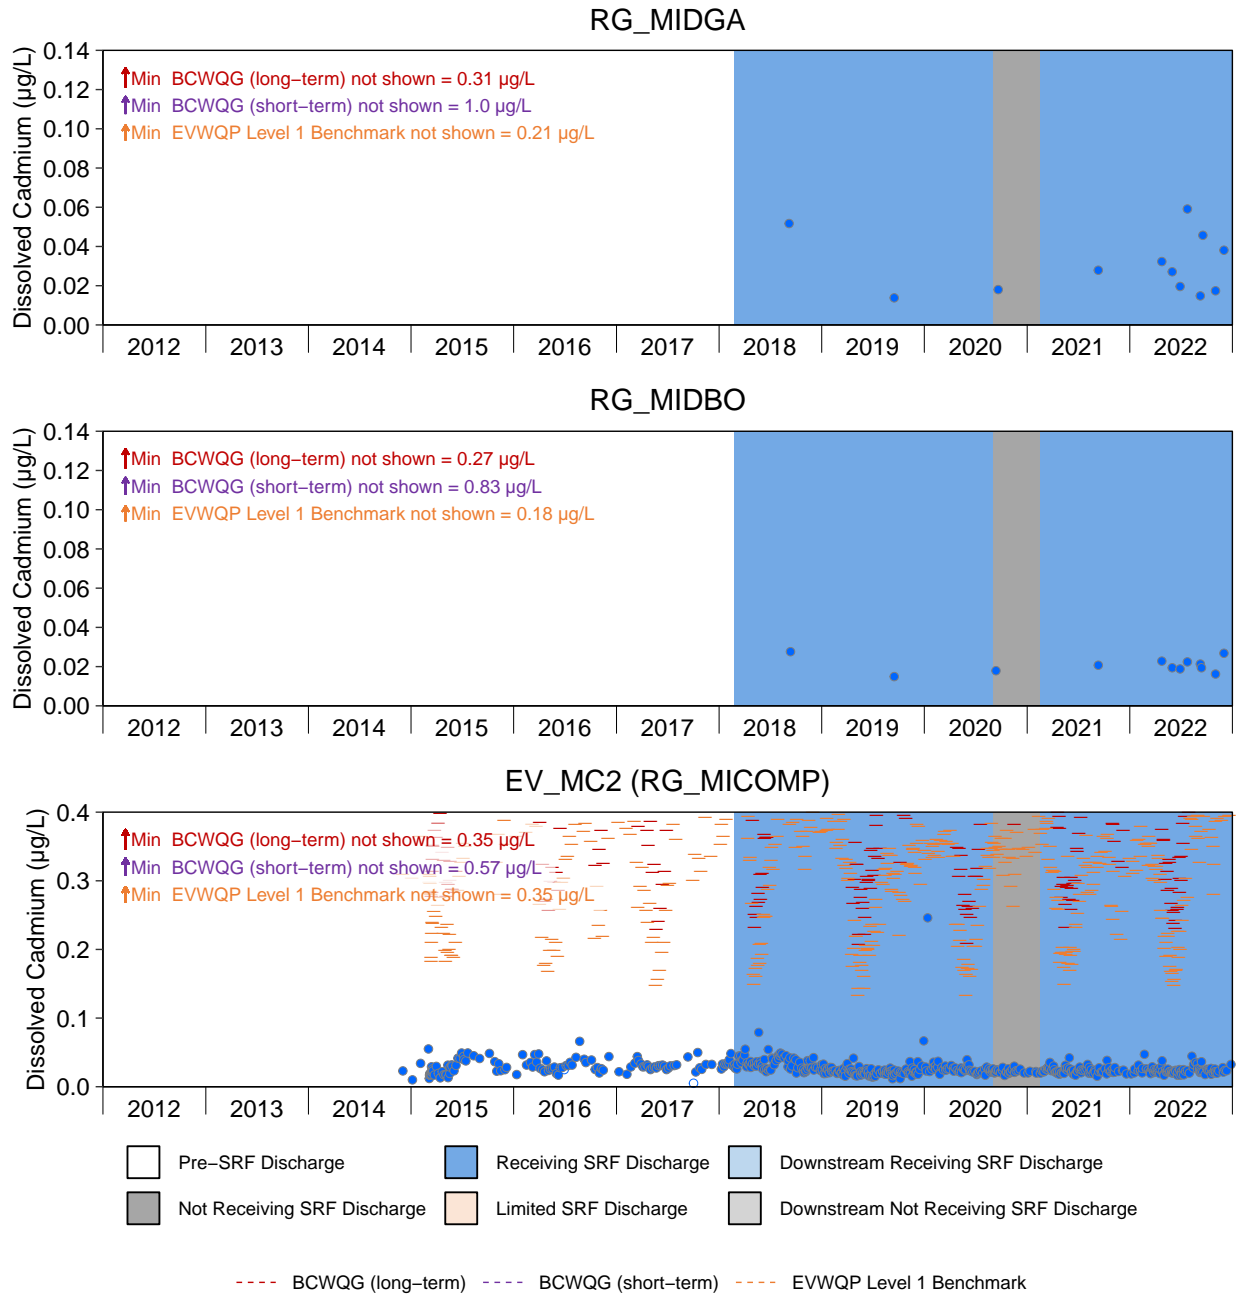

Figure D.13: Time Series Plots for Dissolved Cadmium from EVO LAEMP Areas, 2012 to 2022

Notes: Concentrations reported below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL. Guidelines are dependent on water hardness. Constituent was plotted because it was identified as a mine-related constituent in the Adaptive Management Plan and an early warning trigger was defined (Azimuth 2018).

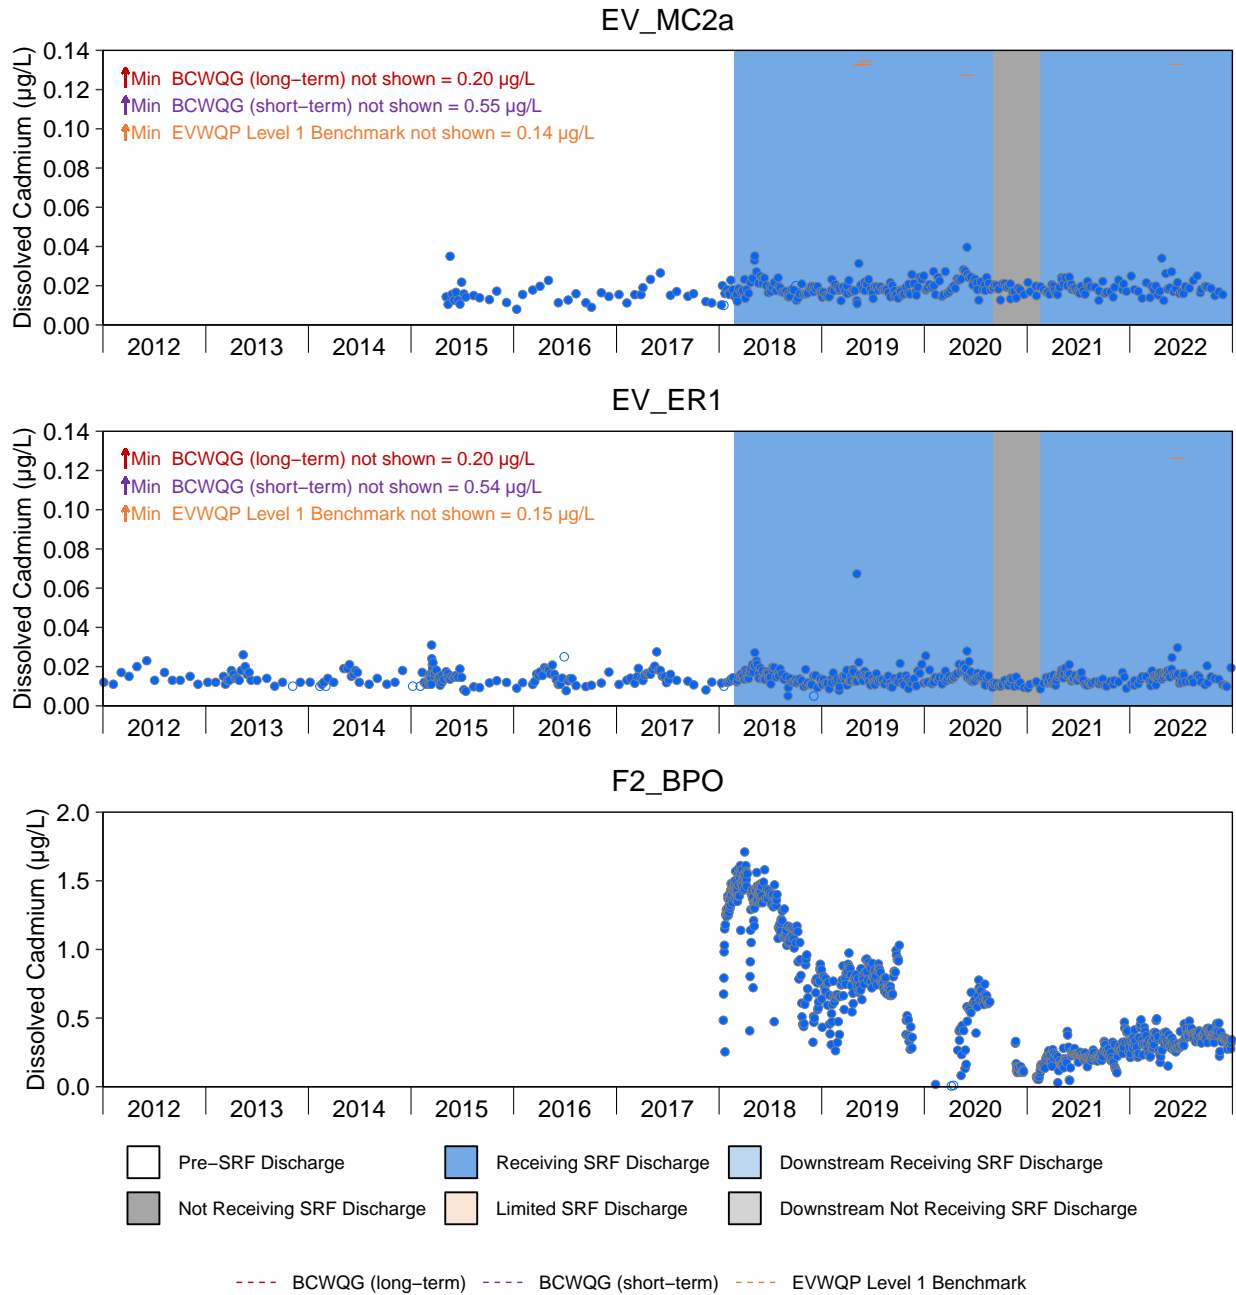

Figure D.13: Time Series Plots for Dissolved Cadmium from EVO LAEMP Areas, 2012 to 2022

Notes: Concentrations reported below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL. Guidelines are dependent on water hardness. Constituent was plotted because it was identified as a mine-related constituent in the Adaptive Management Plan and an early warning trigger was defined (Azimuth 2018).

Figure D.14: Time Series Plots for Dissolved Cobalt from EVO LAEMP Areas, 2012 to 2022

Notes: Concentrations reported below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL. Constituent was plotted because it was identified as a mine-related constituent in the Adaptive Management Plan and an early warning trigger was defined (Azimuth 2018).

Figure D.14: Time Series Plots for Dissolved Cobalt from EVO LAEMP Areas, 2012 to 2022

Notes: Concentrations reported below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL. Constituent was plotted because it was identified as a mine-related constituent in the Adaptive Management Plan and an early warning trigger was defined (Azimuth 2018).

Figure D.14: Time Series Plots for Dissolved Cobalt from EVO LAEMP Areas, 2012 to 2022

Notes: Concentrations reported below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL. Constituent was plotted because it was identified as a mine-related constituent in the Adaptive Management Plan and an early warning trigger was defined (Azimuth 2018).

Figure D.14: Time Series Plots for Dissolved Cobalt from EVO LAEMP Areas, 2012 to 2022

Notes: Concentrations reported below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL. Constituent was plotted because it was identified as a mine-related constituent in the Adaptive Management Plan and an early warning trigger was defined (Azimuth 2018).

Figure D.14: Time Series Plots for Dissolved Cobalt from EVO LAEMP Areas, 2012 to 2022

Notes: Concentrations reported below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL. Constituent was plotted because it was identified as a mine-related constituent in the Adaptive Management Plan and an early warning trigger was defined (Azimuth 2018).

Figure D.14: Time Series Plots for Dissolved Cobalt from EVO LAEMP Areas, 2012 to 2022

Notes: Concentrations reported below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL. Constituent was plotted because it was identified as a mine-related constituent in the Adaptive Management Plan and an early warning trigger was defined (Azimuth 2018).

Figure D.14: Time Series Plots for Dissolved Cobalt from EVO LAEMP Areas, 2012 to 2022

Notes: Concentrations reported below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL. Constituent was plotted because it was identified as a mine-related constituent in the Adaptive Management Plan and an early warning trigger was defined (Azimuth 2018).

Figure D.15: Time Series Plots for Dissolved Iron from EVO LAEMP Areas, 2012 to 2022

Notes: Concentrations reported below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL. Constituent was plotted because it was identified as a mine-related constituent in the Adaptive Management Plan and an early warning trigger was defined (Azimuth 2018).

Figure D.15: Time Series Plots for Dissolved Iron from EVO LAEMP Areas, 2012 to 2022

Notes: Concentrations reported below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL. Constituent was plotted because it was identified as a mine-related constituent in the Adaptive Management Plan and an early warning trigger was defined (Azimuth 2018).

Figure D.15: Time Series Plots for Dissolved Iron from EVO LAEMP Areas, 2012 to 2022

Notes: Concentrations reported below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL. Constituent was plotted because it was identified as a mine-related constituent in the Adaptive Management Plan and an early warning trigger was defined (Azimuth 2018).

Figure D.15: Time Series Plots for Dissolved Iron from EVO LAEMP Areas, 2012 to 2022

Notes: Concentrations reported below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL. Constituent was plotted because it was identified as a mine-related constituent in the Adaptive Management Plan and an early warning trigger was defined (Azimuth 2018).

Figure D.15: Time Series Plots for Dissolved Iron from EVO LAEMP Areas, 2012 to 2022

Notes: Concentrations reported below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL. Constituent was plotted because it was identified as a mine-related constituent in the Adaptive Management Plan and an early warning trigger was defined (Azimuth 2018).

Figure D.15: Time Series Plots for Dissolved Iron from EVO LAEMP Areas, 2012 to 2022

Notes: Concentrations reported below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL. Constituent was plotted because it was identified as a mine-related constituent in the Adaptive Management Plan and an early warning trigger was defined (Azimuth 2018).

Figure D.15: Time Series Plots for Dissolved Iron from EVO LAEMP Areas, 2012 to 2022

Notes: Concentrations reported below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL. Constituent was plotted because it was identified as a mine-related constituent in the Adaptive Management Plan and an early warning trigger was defined (Azimuth 2018).

Figure D.16: Time Series Plots for Dissolved Selenium from EVO LAEMP Areas, 2012 to 2022

Notes: Concentrations reported below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL. Constituent was plotted because it was identified as a mine-related constituent in the Adaptive Management Plan and an early warning trigger was defined (Azimuth 2018).

Figure D.16: Time Series Plots for Dissolved Selenium from EVO LAEMP Areas, 2012 to 2022

Notes: Concentrations reported below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL. Constituent was plotted because it was identified as a mine-related constituent in the Adaptive Management Plan and an early warning trigger was defined (Azimuth 2018).

Figure D.16: Time Series Plots for Dissolved Selenium from EVO LAEMP Areas, 2012 to 2022

Notes: Concentrations reported below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL. Constituent was plotted because it was identified as a mine-related constituent in the Adaptive Management Plan and an early warning trigger was defined (Azimuth 2018).

Concentrations below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL value.

Figure D.33: Sediment Metal and Polycyclic Aromatic Hydrocarbon (PAH) Concentrations in September, EVO LAEMP, 2018 to 2022

Notes: Green symbols represent reference areas and blue symbols represent exposed areas. Solid red line = Lower BC WSQG; broken red line = Upper BC WSQG. BC WSQG = British Columbia Working Sediment Quality Guideline (BCMOECCS 2021a) and approved BC Sediment Quality Guideline for Selenium (BCMOECCS 2021b). Shading represents the normal range which represents the 2.5th to 97.5th percentiles of 2017 and 2020 regional reference area data. Concentrations below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL value.

- Post-hoc p-value indicating significant difference between areas.
- Mine-exposed area significantly different from reference area for that year.
- Mine-exposed area significantly different from reference area for that year.

^aPlanned contrasts comparing the difference between each area in each year from a two-way ANOVA with terms for area and year. The Magnitude of Difference (MOD) was calculated as (mine-exposed-reference)/reference * 100%.

^b Post-hoc test comparing changes in the relative difference between areas among years. Years that do not share a letter differ in their relative difference. Letters are arranged such that the greatest difference between the areas have the highest letter (i.e., A).

Table D.1: Comparison of Concentrations of Water Quality Constituents Upstream and Downstream of SRF Treatment on Erickson Creek, EVO LAEMP, 2019 to 2022

- Mine-exposed area significantly different from reference area for that year.
- Mine-exposed area significantly different from reference area for that year.

^a Planned contrasts comparing the difference between each area in each year from a two-way ANOVA with terms for area and year. The Magnitude of Difference (MOD) was calculated as (mine-exposed-reference)/reference * 100%.

^b Post-hoc test comparing changes in the relative difference between areas among years. Years that do not share a letter differ in their relative difference. Letters are arranged such that the greatest difference between the areas have the highest letter (i.e., A).

Table D.2: Temporal Changes in Water Chemistry Constituents at Stations, EVO LAEMP, 2012 to 2022

Parameter	Area Type	Area	Annual Variation ^a		Q1. Is there a positive or negative change in concentrations since the base year (b) of monitoring? Magnitude of Difference (MOD) ^b and Significance (bolded) from Base Year (b) ^c											Q2. Is the 2022 annual mean greater or less than all annual historical means (2012 to 2021) and the previous year (2021)? ^c

- P-value < 0.05 (annual variation).
- > 20% Decrease in concentration.
- > 33% Decrease in concentration.
- > 43% Decrease in concentration.
- > 50% Decrease in concentration.
- > 25% Increase in concentration.
- > 50% Increase in concentration.
- > 75% Increase in concentration.
- > 100% Increase in concentration.

***Bold** Significant increase or decrease from base year ^b.

Notes: "ns" = not significant; "-" insufficient data for comparison, where insufficient data is less than 6 months of recorded data or > 75% LRL data in a given year. "nc" = post-hoc test not conducted because of non-significant year term.

^a The presence of annual variation was determined by a significant Year term (α = 0.05) using an ANOVA with factors Year and Month.

^b Magnitude of Difference (MOD) was calculated as the concentrations in each year (or 2022) minus the concentration in the first year (or 2021) divided by the concentration in the first year (or 2021) × 100.

^c Significance between each year determined using all pairwise comparisons with Tukey correction.

 > 5% of samples exceed the guideline or benchmark.
 > 50% of samples exceed the guideline or benchmark.
 > 95% of samples exceed the guideline or benchmark.

Notes: "UEC" = Updated Effects Concentration. "LRL" = laboratory reporting limit. "BCWQG" = British Columbia Working or Accepted Water Quality Guideline. UEC's are shown for Nitrate, Sulphate, and Dissolved Nickel, and EVWQP benchmarks are shown for all other relevant parameters. For guidelines dependent on other analytes (e.g., hardness or chloride), guidelines were screened using concurrent concentrations. When concurrent hardness or chloride concentrations were not measured, the most conservative concentration observed for that station was used to estimate the guidelines or benchmark. All summary statistics are reported to 3 significant figures. When biological monitoring areas and routine water quality stations were in close proximity to each other and with no additional inputs between them, data collected at the biological monitoring area were combined with routine data and tabulated together with the biological monitoring area depicted in parenthesis.

^a Long-term average BCQWG for the Protection of Aquatic Life.

^b Short-term maximum BCQWG for the Protection of Aquatic Life.

 > 5% of samples exceed the guideline or benchmark.
 > 50% of samples exceed the guideline or benchmark.
 > 95% of samples exceed the guideline or benchmark.

Notes: "UEC" = Updated Effects Concentration. "LRL" = laboratory reporting limit. "BCWQG" = British Columbia Working or Accepted Water Quality Guideline. UEC's are shown for Nitrate, Sulphate, and Dissolved Nickel, and EVWQP benchmarks are shown for all other relevant parameters. For guidelines dependent on other analytes (e.g., hardness or chloride), guidelines were screened using concurrent concentrations. When concurrent hardness or chloride concentrations were not measured, the most conservative concentration observed for that station was used to estimate the guidelines or benchmark. All summary statistics are reported to 3 significant figures. When biological monitoring areas and routine water quality stations were in close proximity to each other and with no additional inputs between them, data collected at the biological monitoring area were combined with routine data and tabulated together with the biological monitoring area depicted in parenthesis.

^a Long-term average BCQWG for the Protection of Aquatic Life.
^b Short-term maximum BCQWG for the Protection of Aquatic Life.

 > 95% of samples exceed the guideline or benchmark.

Notes: "UEC" = Updated Effects Concentration. "LRL" = laboratory reporting limit. "BCWQG" = British Columbia Working or Accepted Water Quality Guideline. UEC's are shown for Nitrate, Sulphate, and Dissolved Nickel, and EVWQP benchmarks are shown for all other relevant parameters. For guidelines dependent on other analytes (e.g., hardness or chloride), guidelines were screened using concurrent concentrations. When concurrent hardness or chloride concentrations were not measured, the most conservative concentration observed for that station was used to estimate the guidelines or benchmark. All summary statistics are reported to 3 significant figures. When biological monitoring areas and routine water quality stations were in close proximity to each other and with no additional inputs between them, data collected at the biological monitoring area were combined with routine data and tabulated together with the biological monitoring area depicted in parenthesis.

> 5% of samples exceed the guideline or benchmark.
 > 50% of samples exceed the guideline or benchmark.
 > 95% of samples exceed the guideline or benchmark.
 Notes: "UEC" = Updated Effects Concentration. "LRL" = laboratory reporting limit. "BCWQG" = British Columbia Working or Accepted Water Quality Guideline. UEC's are shown for Nitrate, Sulphate, and Dissolved Nickel, and EVWQP benchmarks are shown for all other relevant parameters. For guidelines dependent on other analytes (e.g., hardness or chloride), guidelines were screened using concurrent concentrations. When concurrent hardness or chloride concentrations were not measured, the most conservative concentration observed for that station was used to estimate the guidelines or benchmark. All summary statistics are reported to 3 significant figures. When biological monitoring areas and routine water quality stations were in close proximity to each other and with no additional inputs between them, data collected at the biological monitoring area were combined with routine data and tabulated together with the biological monitoring area depicted in parenthesis.
^a Long-term average BCQWG for the Protection of Aquatic Life.
^b Short-term maximum BCQWG for the Protection of Aquatic Life.

> 95% of samples exceed the guideline or benchmark.

Notes: "UEC" = Updated Effects Concentration. "LRL" = laboratory reporting limit. "BCWQG" = British Columbia Working or Accepted Water Quality Guideline. UEC's are shown for Nitrate, Sulphate, and Dissolved Nickel, and EVWQP benchmarks are shown for all other relevant parameters. For guidelines dependent on other analytes (e.g., hardness or chloride), guidelines were screened using concurrent concentrations. When concurrent hardness or chloride concentrations were not measured, the most conservative concentration observed for that station was used to estimate the guidelines or benchmark. All summary statistics are reported to 3 significant figures. When biological monitoring areas and routine water quality stations were in close proximity to each other and with no additional inputs between them, data collected at the biological monitoring area were combined with routine data and tabulated together with the biological monitoring area depicted in parenthesis.

^a Long-term average BCQWG for the Protection of Aquatic Life.

^b Short-term maximum BCQWG for the Protection of Aquatic Life.

- Post-hoc p-value indicating significant difference between areas.
- Mine-exposed area significantly different from reference area for that year.
- Mine-exposed area significantly different from reference area for that year.

^a Planned contrasts comparing the difference between each area in each year from a two-way ANOVA with terms for area and year. The Magnitude of Difference (MOD) was calculated as (mine-exposed-reference)/reference * 100%.

^b Post-hoc test comparing changes in the relative difference between areas among years. Years that do not share a letter differ in their relative difference. Letters are arranged such that the greatest difference between the areas have the highest letter (i.e., A).

- Post-hoc p-value indicating significant difference between areas.
- Mine-exposed area significantly different from reference area for that year.
- Mine-exposed area significantly different from reference area for that year.

^a Planned contrasts comparing the difference between each area in each year from a two-way ANOVA with terms for area and year. The Magnitude of Difference (MOD) was calculated as (mine-exposed-reference)/reference * 100%.

^b Post-hoc test comparing changes in the relative difference between areas among years. Years that do not share a letter differ in their relative difference. Letters are arranged such that the greatest difference between the areas have the highest letter (i.e., A).

Indicates values is greater than the lower British Columbia Working Sediment Quality Guidelines.

Indicates values is greater than the upper British Columbia Working Sediment Quality Guidelines.

Notes: "-" indicates data not available. LRL = laboratory reporting limit. BC WSQG = British Columbia Working Sediment Quality Guidelines (BCMOECCS 2021b) and approved BC Sediment Quality Guideline for Selenium (BCMOECCS 2021a). All data and summary statistics are displayed to three significant digits.

APPENDIX E
PERIPHYTON

Table E.1: Visual Periphyton Coverage Scores from EVO LAEMP, September 2022

Area Type	Biological Area Code	Station					Mean	Standard Deviation
		1	2	3	4	5		
Reference	RG_ALUSM	3	3	3	-	-	3.00	0
Mine-Exposed	RG_ERCKUT	2	2	2	-	-	2.00	0
Mine-Exposed	RG_ERCKDT	3	3	3	-	-	3.00	0
Mine-Exposed	RG_ERCK	5	-	-	-	-	5.00	-
Mine-Exposed	RG_GATE	2	2	-	-	-	2.00	0
Mine-Exposed	RG_BOCK	1	1	1	-	-	1.00	0
Mine-Exposed	RG_MI3	2	2	2	-	-	2.00	0
Mine-Exposed	RG_MIDER	2	2	2	-	-	2.00	0
Mine-Exposed	RG_MIDBO	2	2	2	-	-	2.00	0
Mine-Exposed	RG_MIDGA	2	2	2	-	-	2.00	0
Mine-Exposed	RG_MICOMP	3	3	3	3	3	3.00	0

Notes: Periphyton Coverage Scores (Environment Canada, 2012b):

1 = Rocks not slippery, no obvious colour (<0.5mm thick)

2 = Rocks slightly slippery, yellow-brown to light green colour (0.5-1mm thick)

3 = Rocks have noticeable slippery feel, patches of thicker green to brown algae (1-5mm thick)

4 = Rocks are very slippery, numerous clumps (5-20mm thick)

5 = Rocks mostly obscured by algae mat, may have long strands (>20mm thick)

^aThe mean score of five individual assessments at the station.

APPENDIX F
BIT, HESS, and BIC

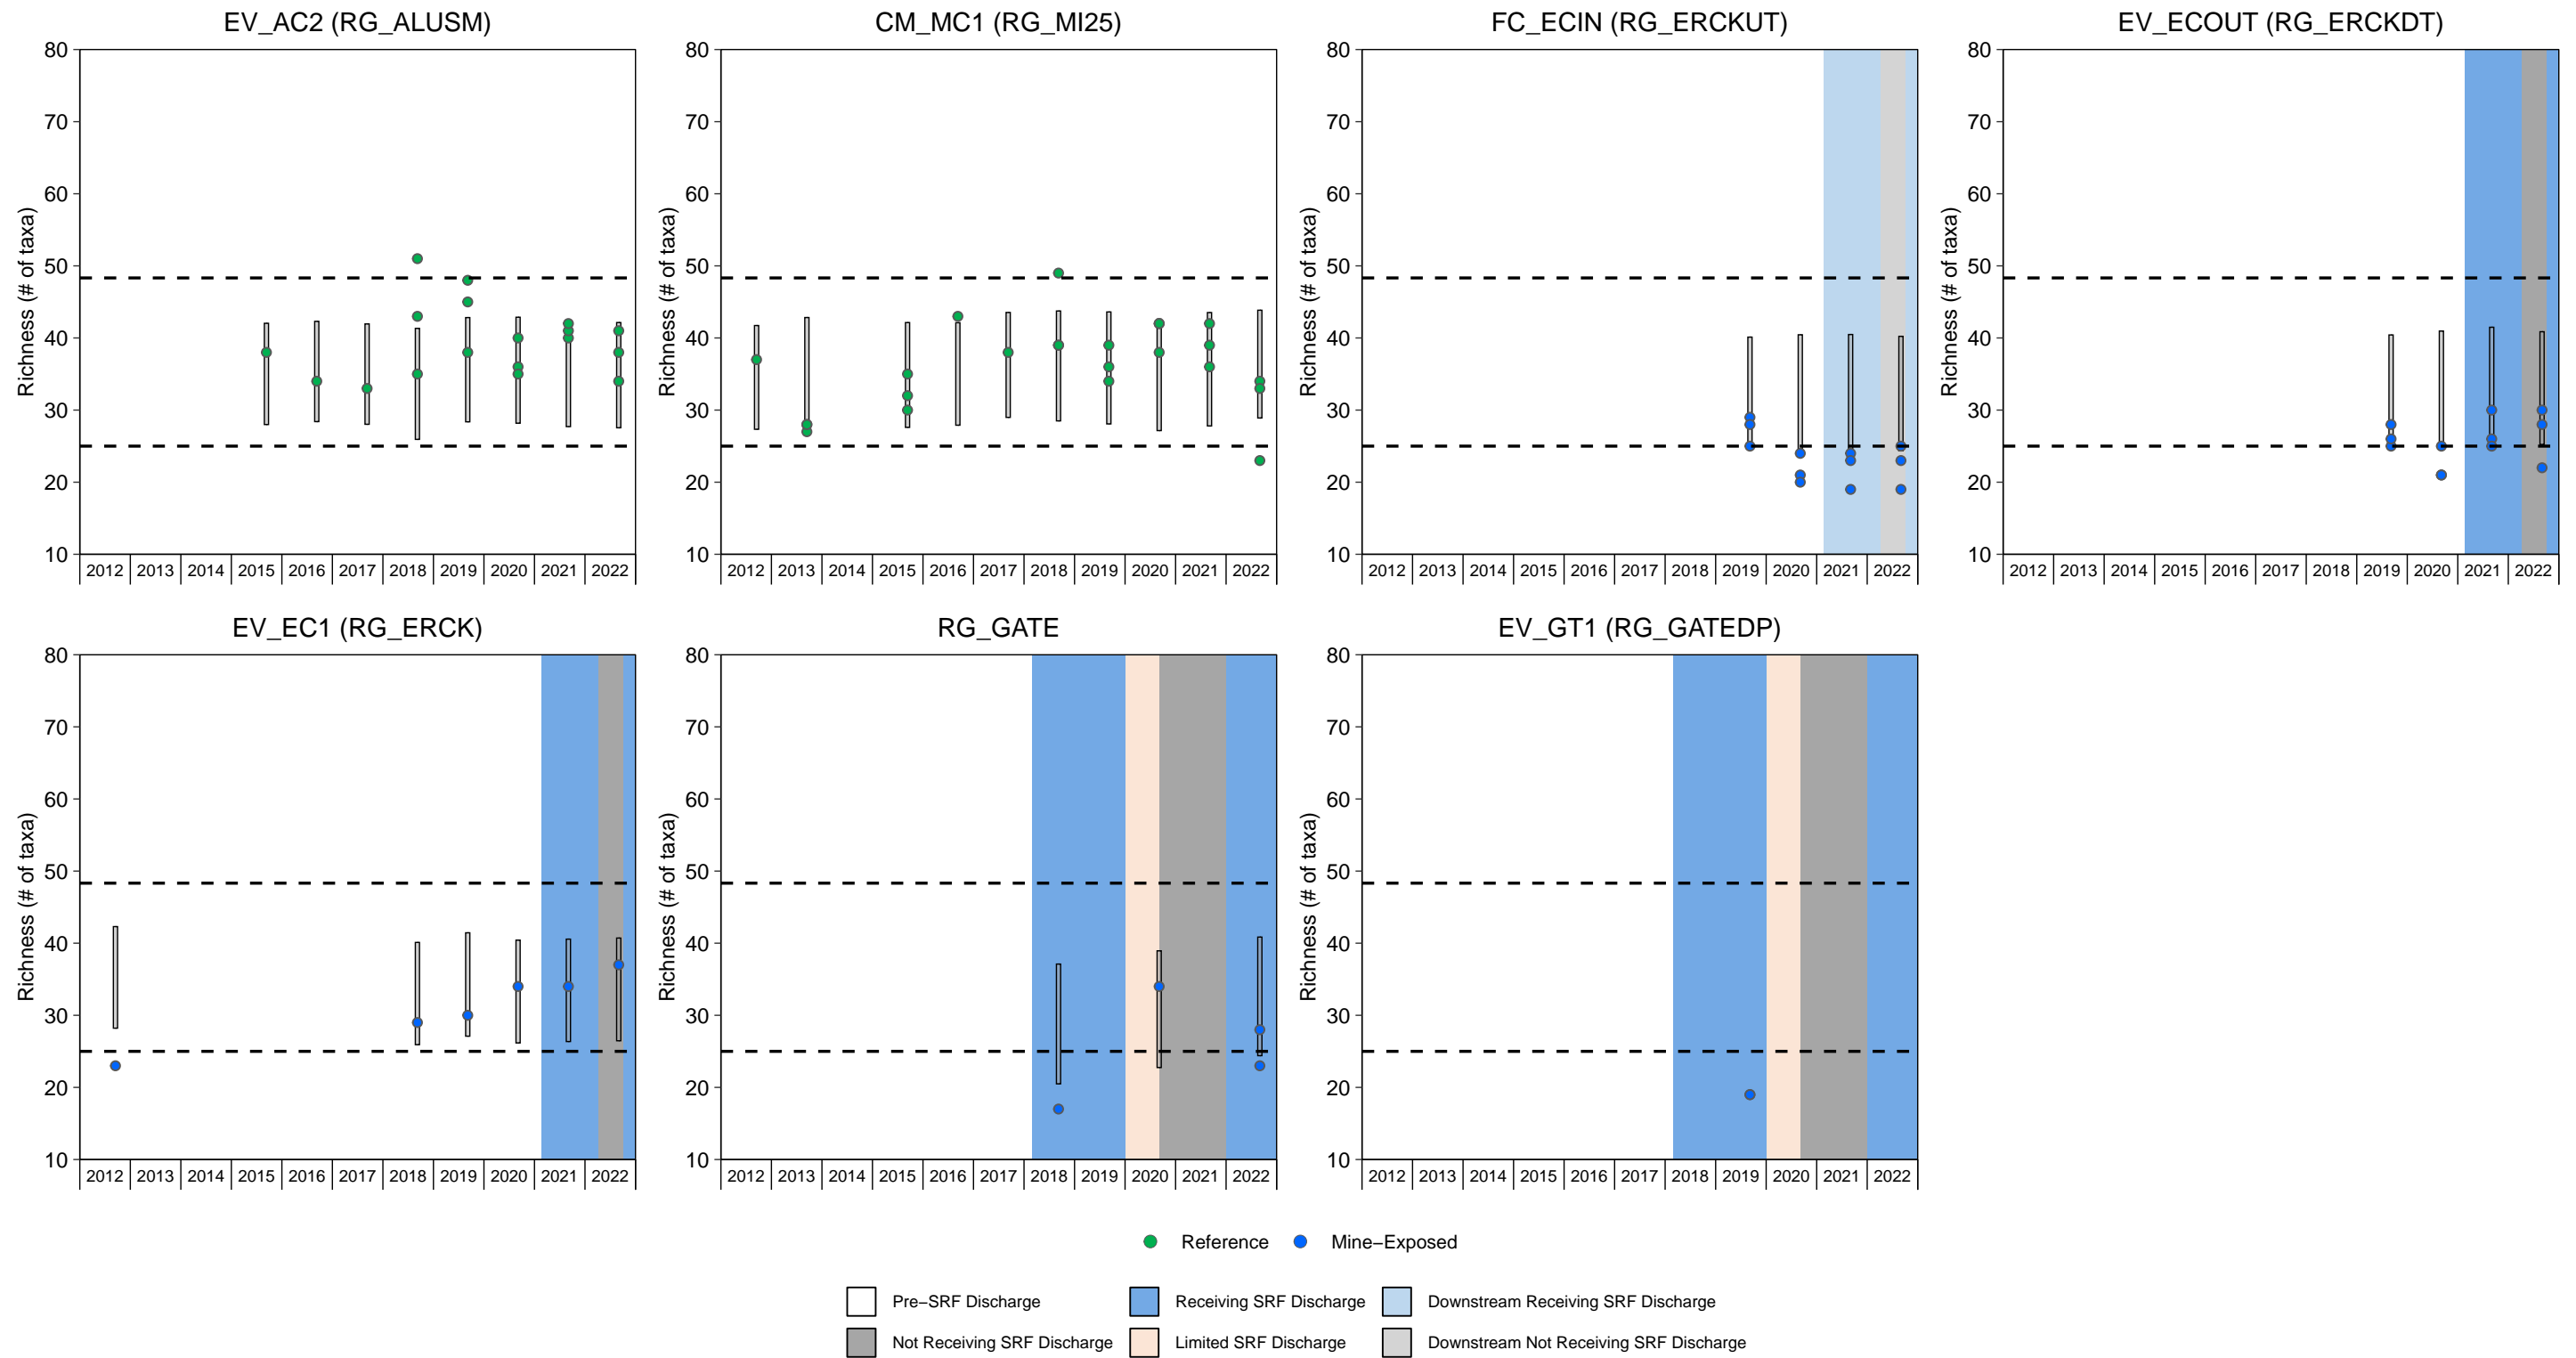

Figure F.1: Benthic Invertebrate Community Endpoints from EVO LAEMP Sampling Areas, September 2012 to 2022

Notes: Site specific normal ranges using regression models shown with grey shading and black rectangle (when available). Normal ranges using percentiles of reference areas from 2012 to 2019 shown as dashed horizontal lines. Values that were close to or equal to 0 were plotted as 1 on the y-axis (on a log10-scale) for abundance

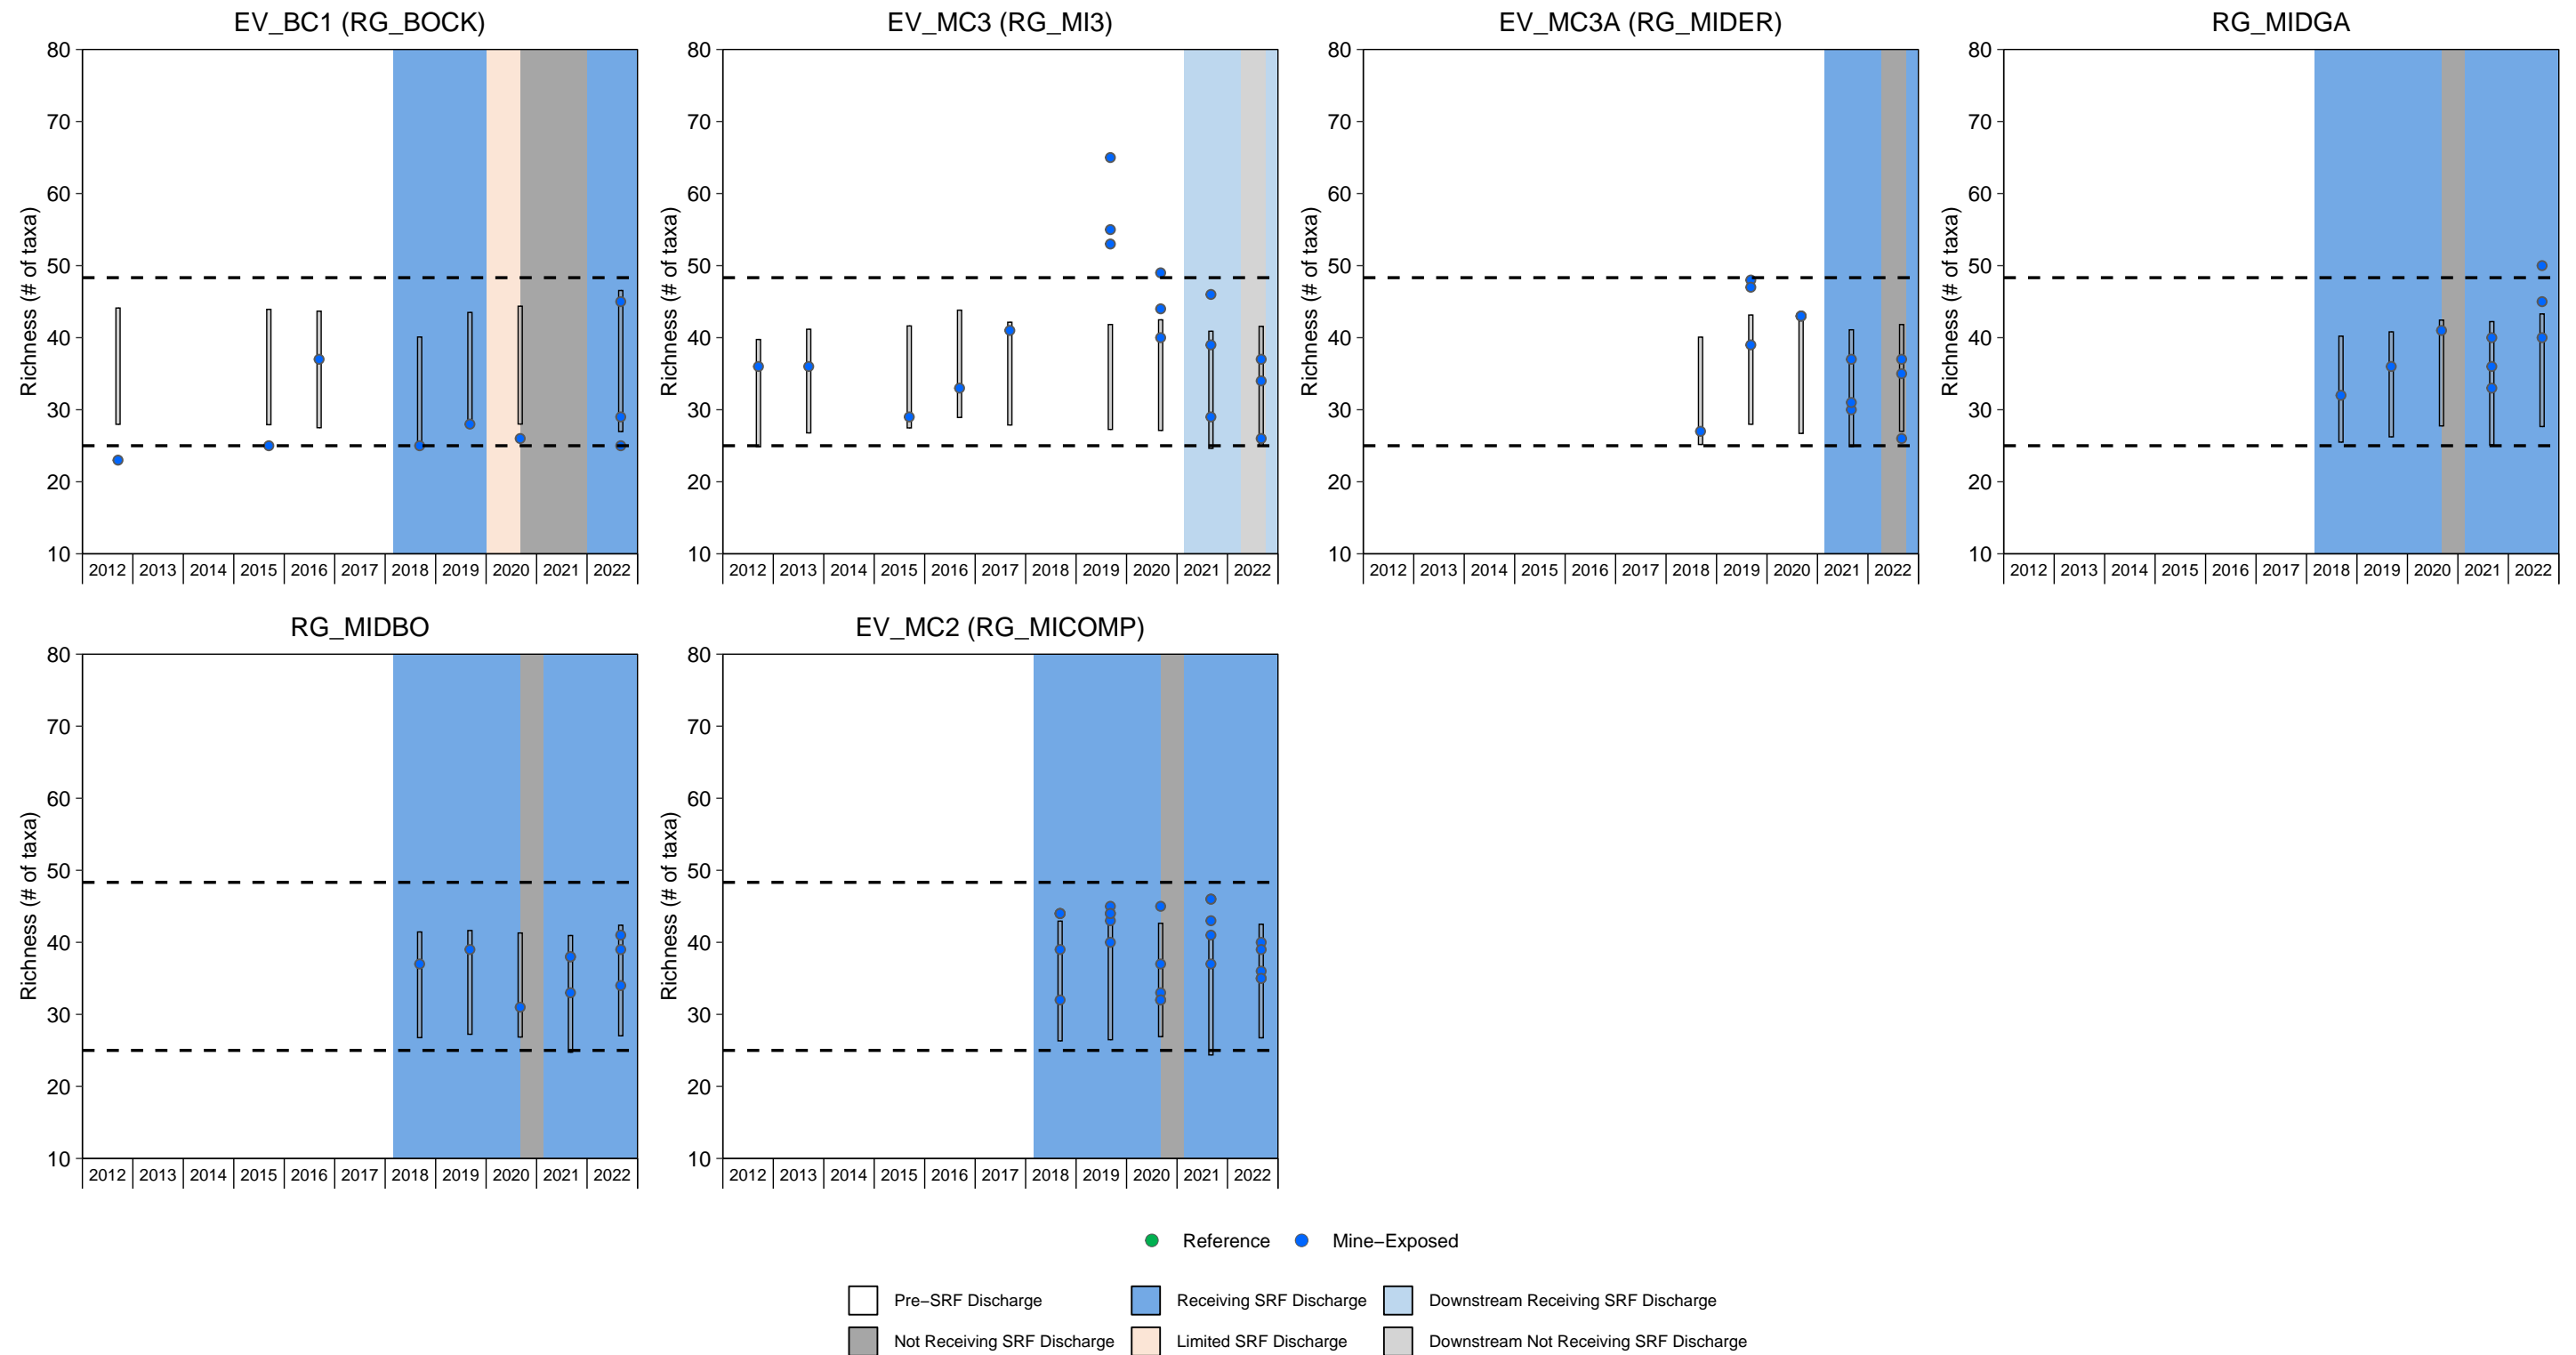

Figure F.1: Benthic Invertebrate Community Endpoints from EVO LAEMP Sampling Areas, September 2012 to 2022

Notes: Site specific normal ranges using regression models shown with grey shading and black rectangle (when available). Normal ranges using percentiles of reference areas from 2012 to 2019 shown as dashed horizontal lines. Values that were close to or equal to 0 were plotted as 1 on the y-axis (on a log₁₀-scale) for abundance

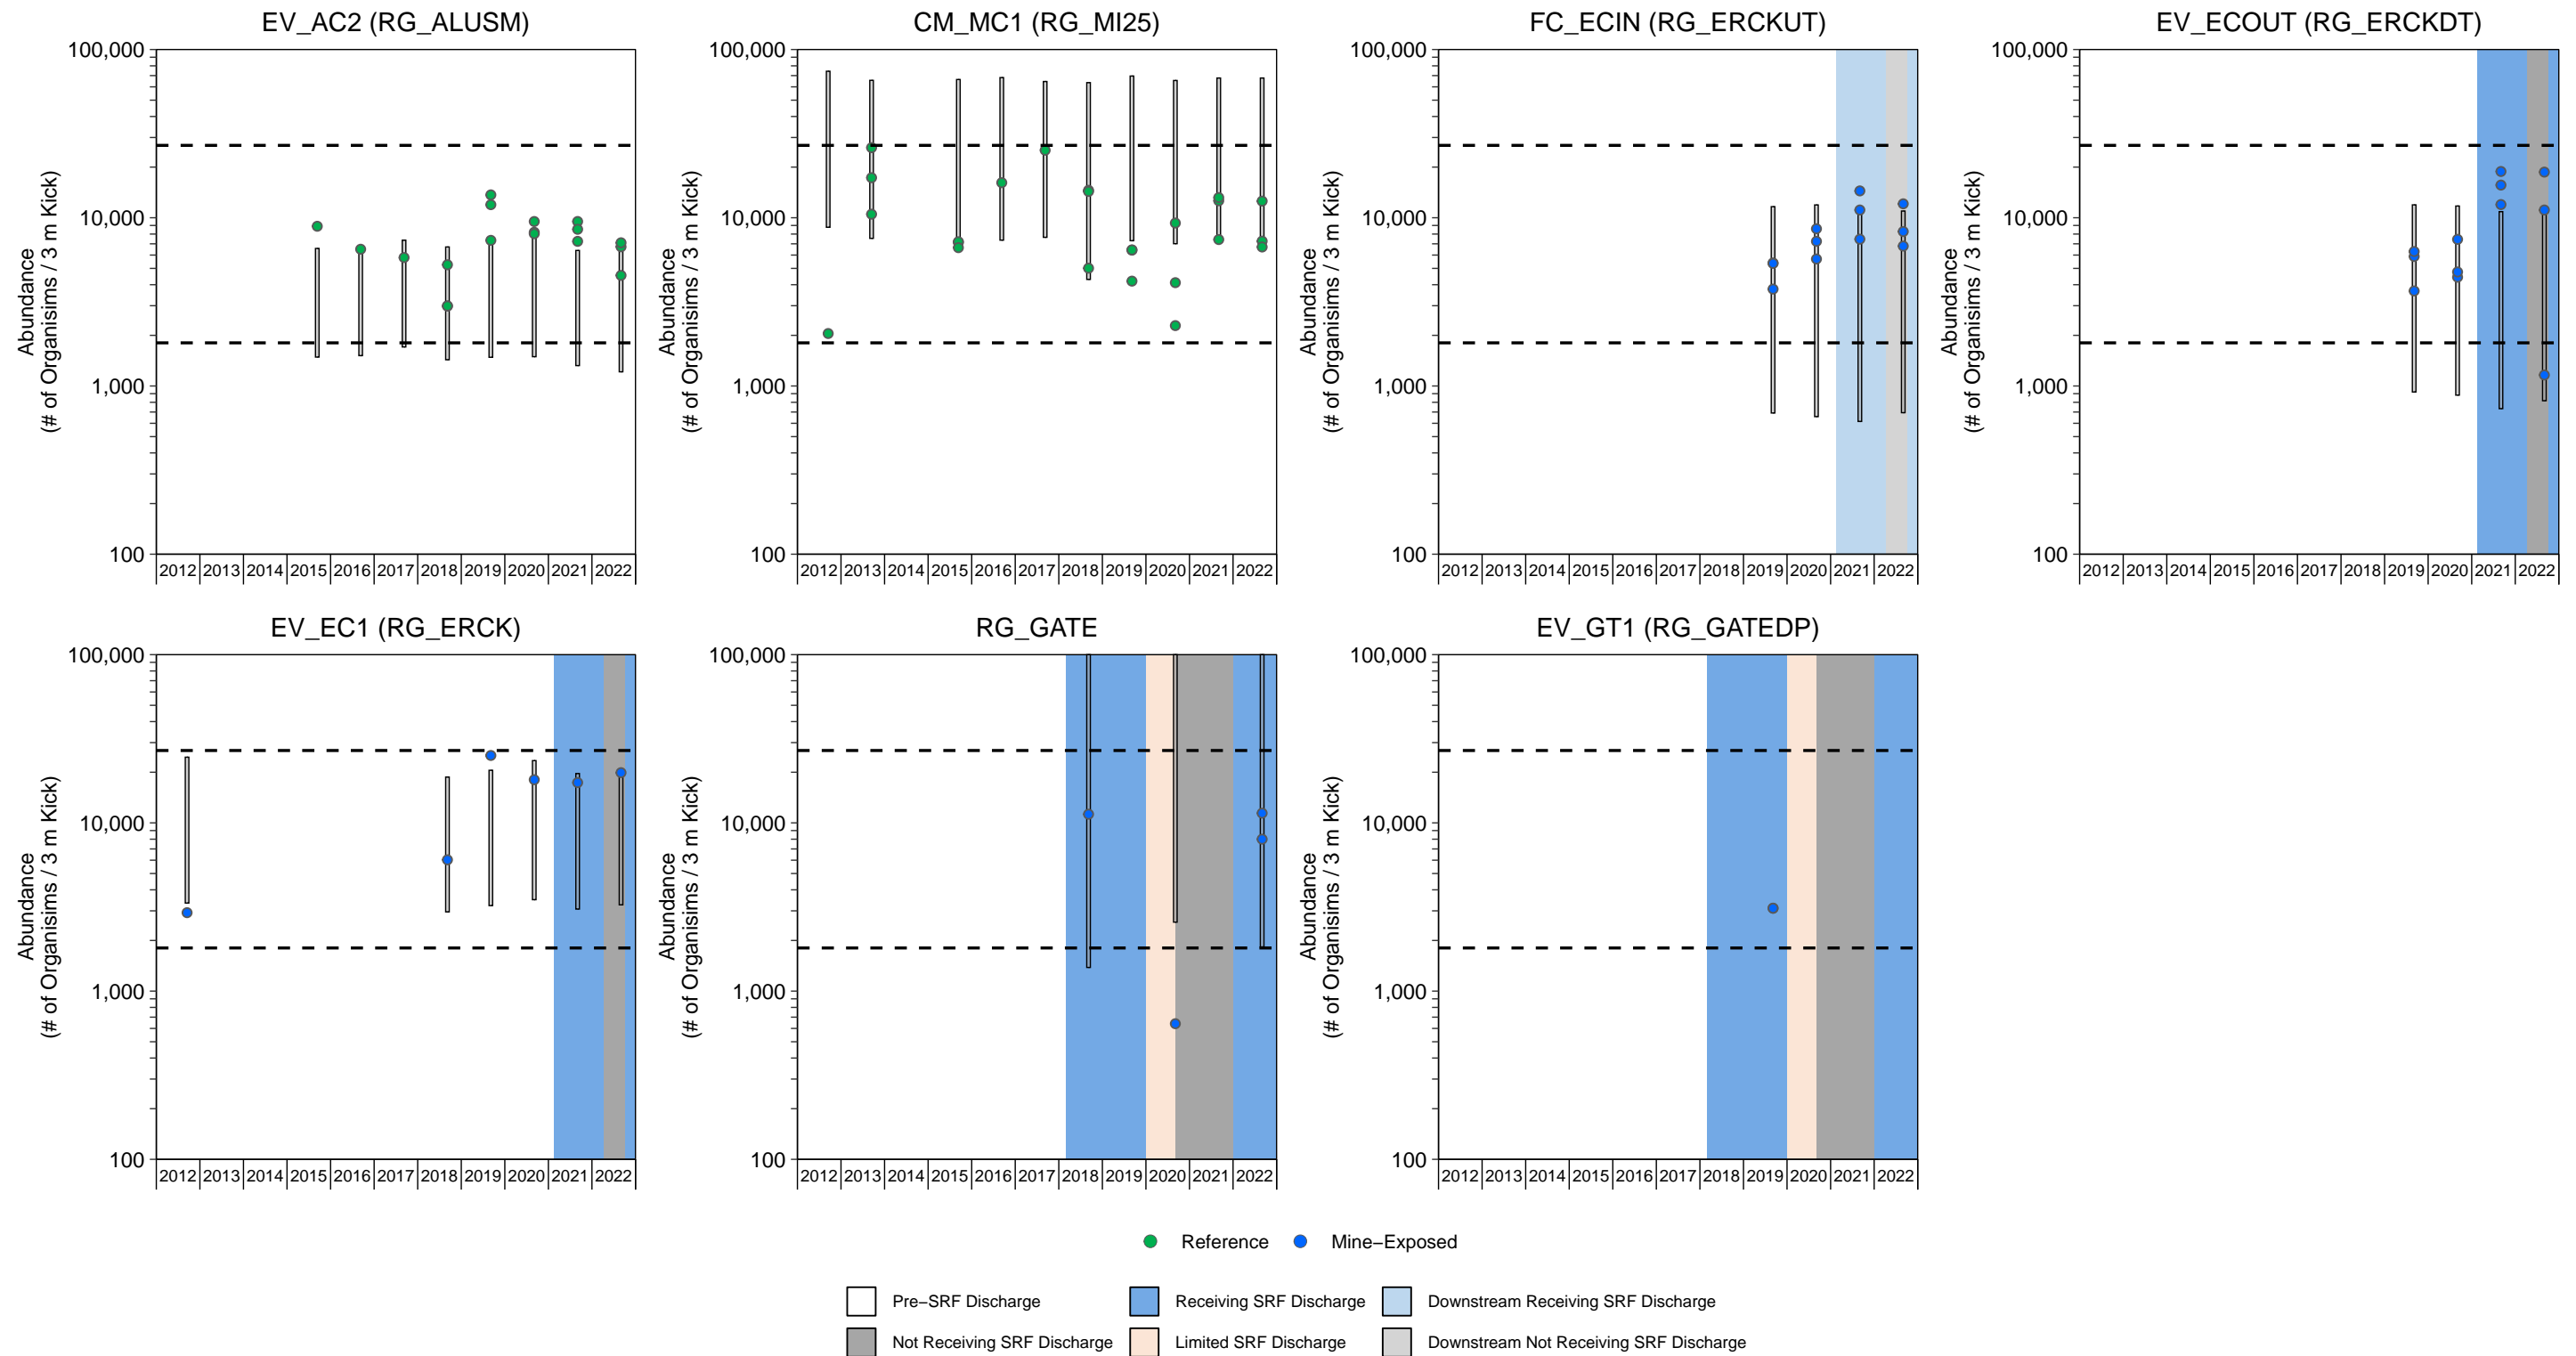

Figure F.2: Benthic Invertebrate Community Endpoints from EVO LAEMP Sampling Areas, September 2012 to 2022

Notes: Site specific normal ranges using regression models shown with grey shading and black rectangle (when available). Normal ranges using percentiles of reference areas from 2012 to 2019 shown as dashed horizontal lines. Values that were close to or equal to 0 were plotted as 1 on the y-axis (on a log10-scale) for abundance

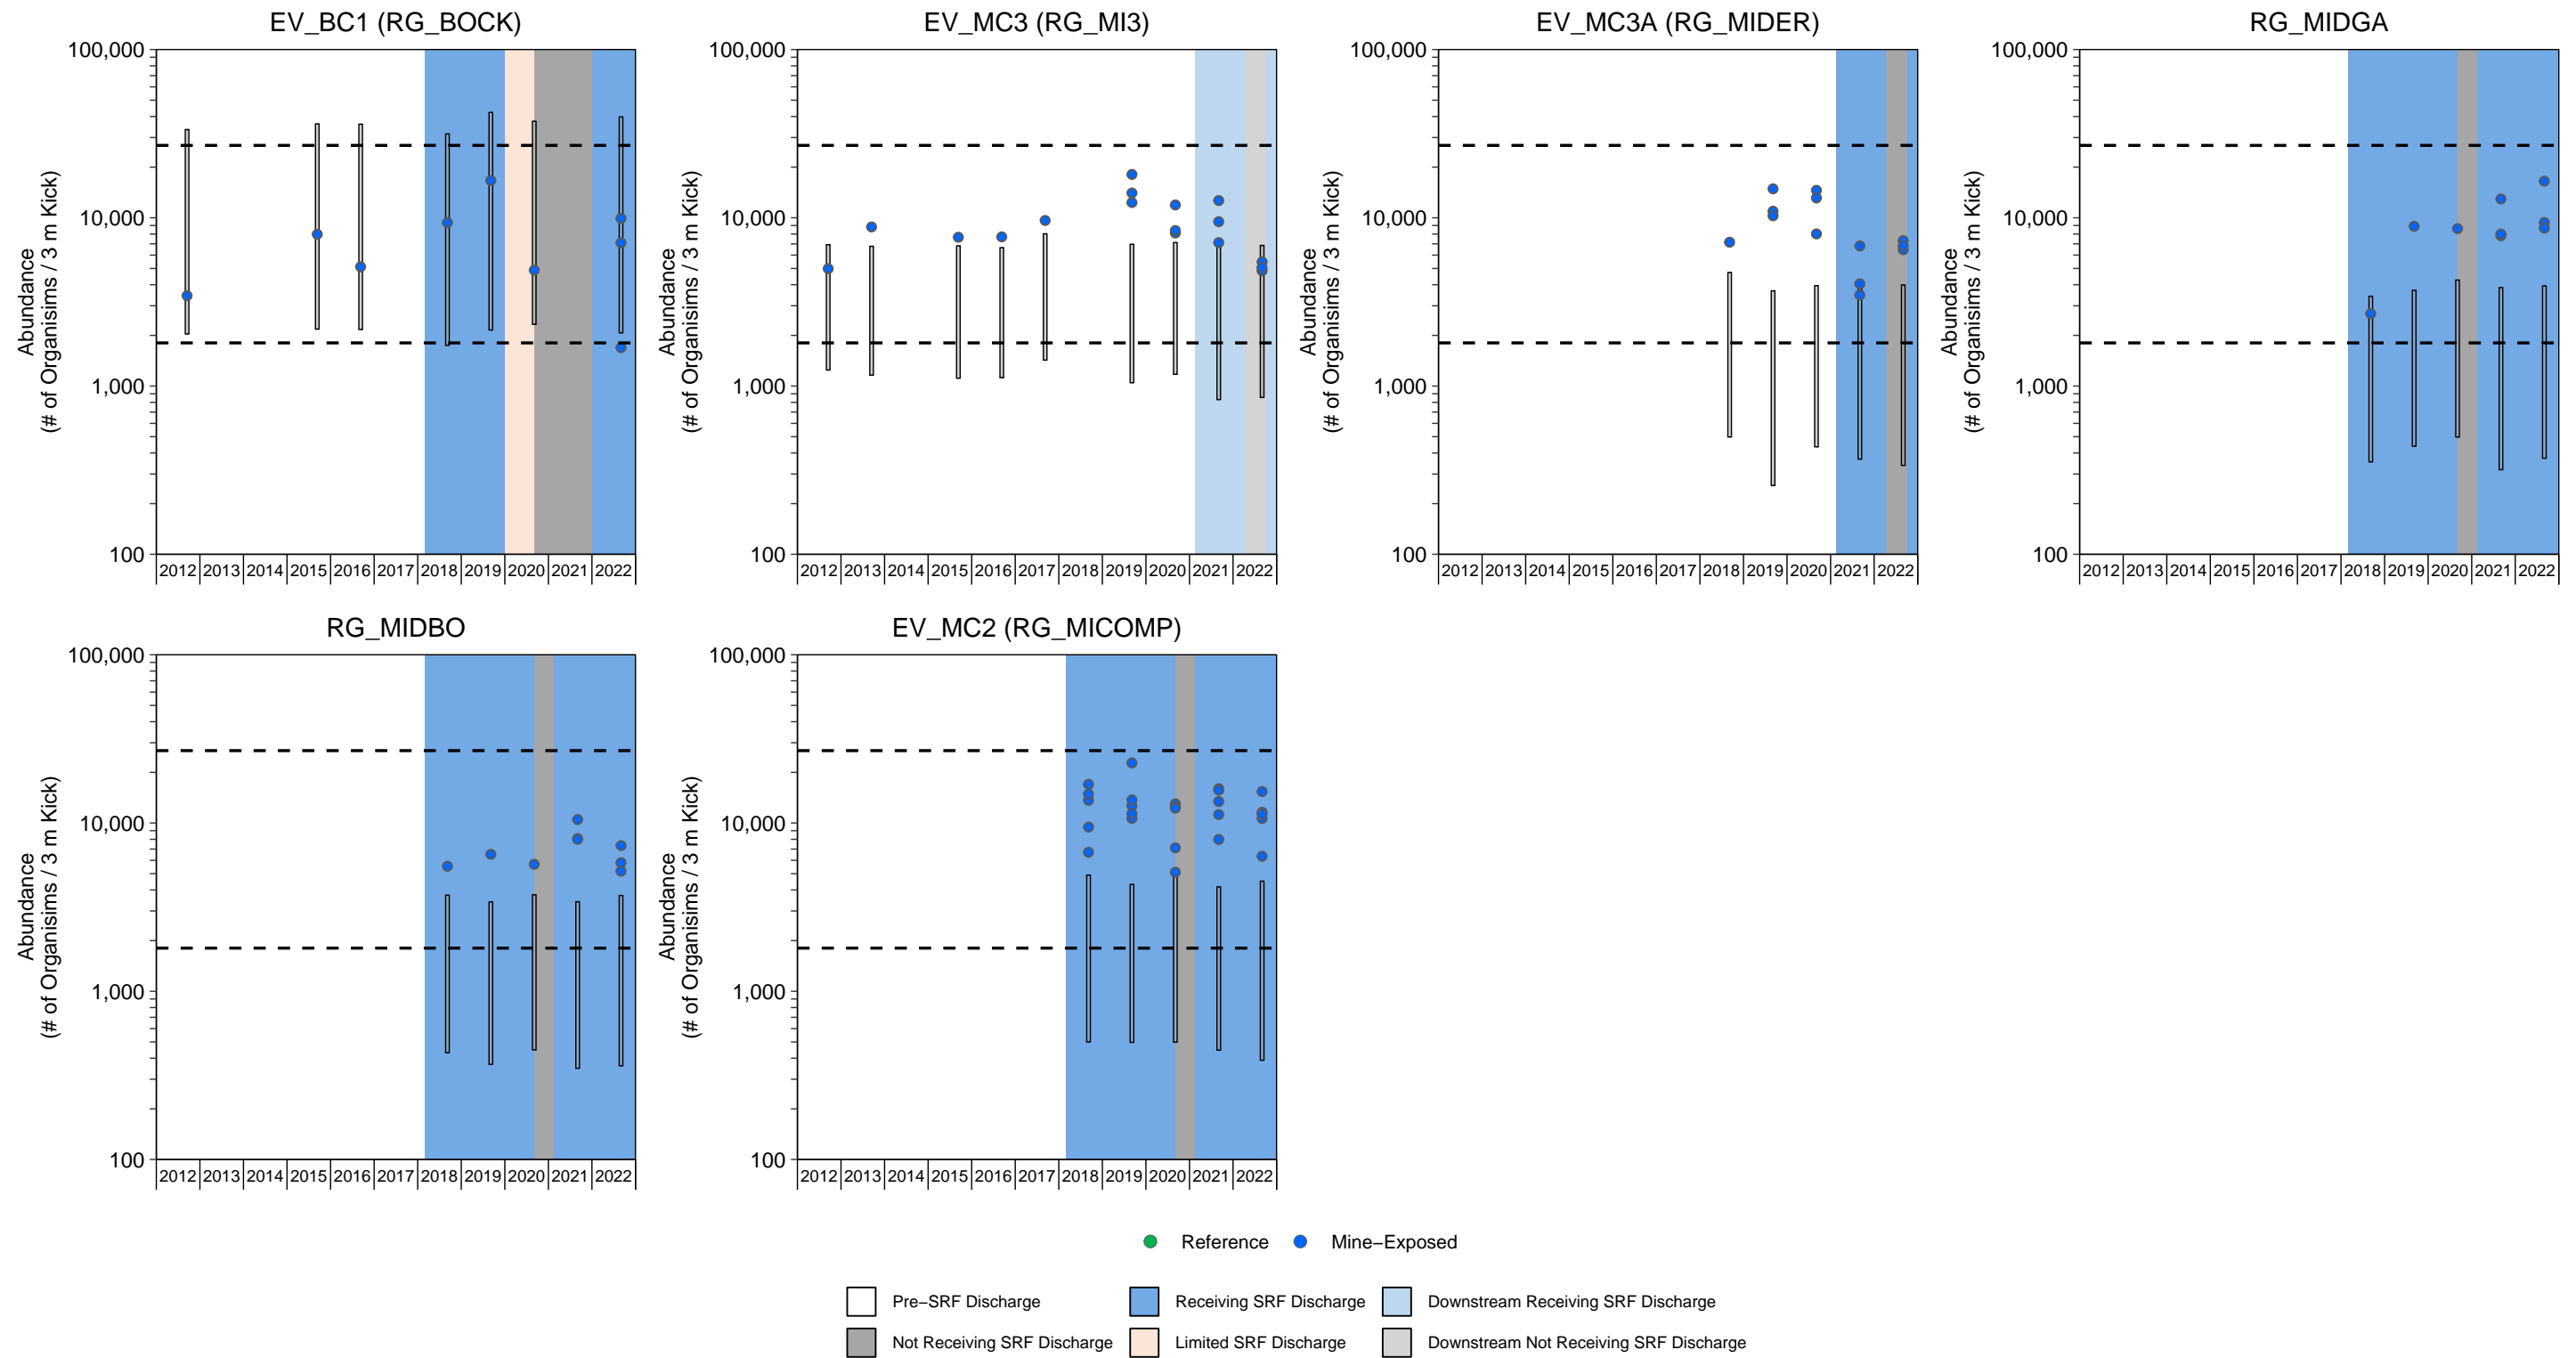

Figure F.2: Benthic Invertebrate Community Endpoints from EVO LAEMP Sampling Areas, September 2012 to 2022

Notes: Site specific normal ranges using regression models shown with grey shading and black rectangle (when available). Normal ranges using percentiles of reference areas from 2012 to 2019 shown as dashed horizontal lines. Values that were close to or equal to 0 were plotted as 1 on the y-axis (on a log₁₀-scale) for abundance

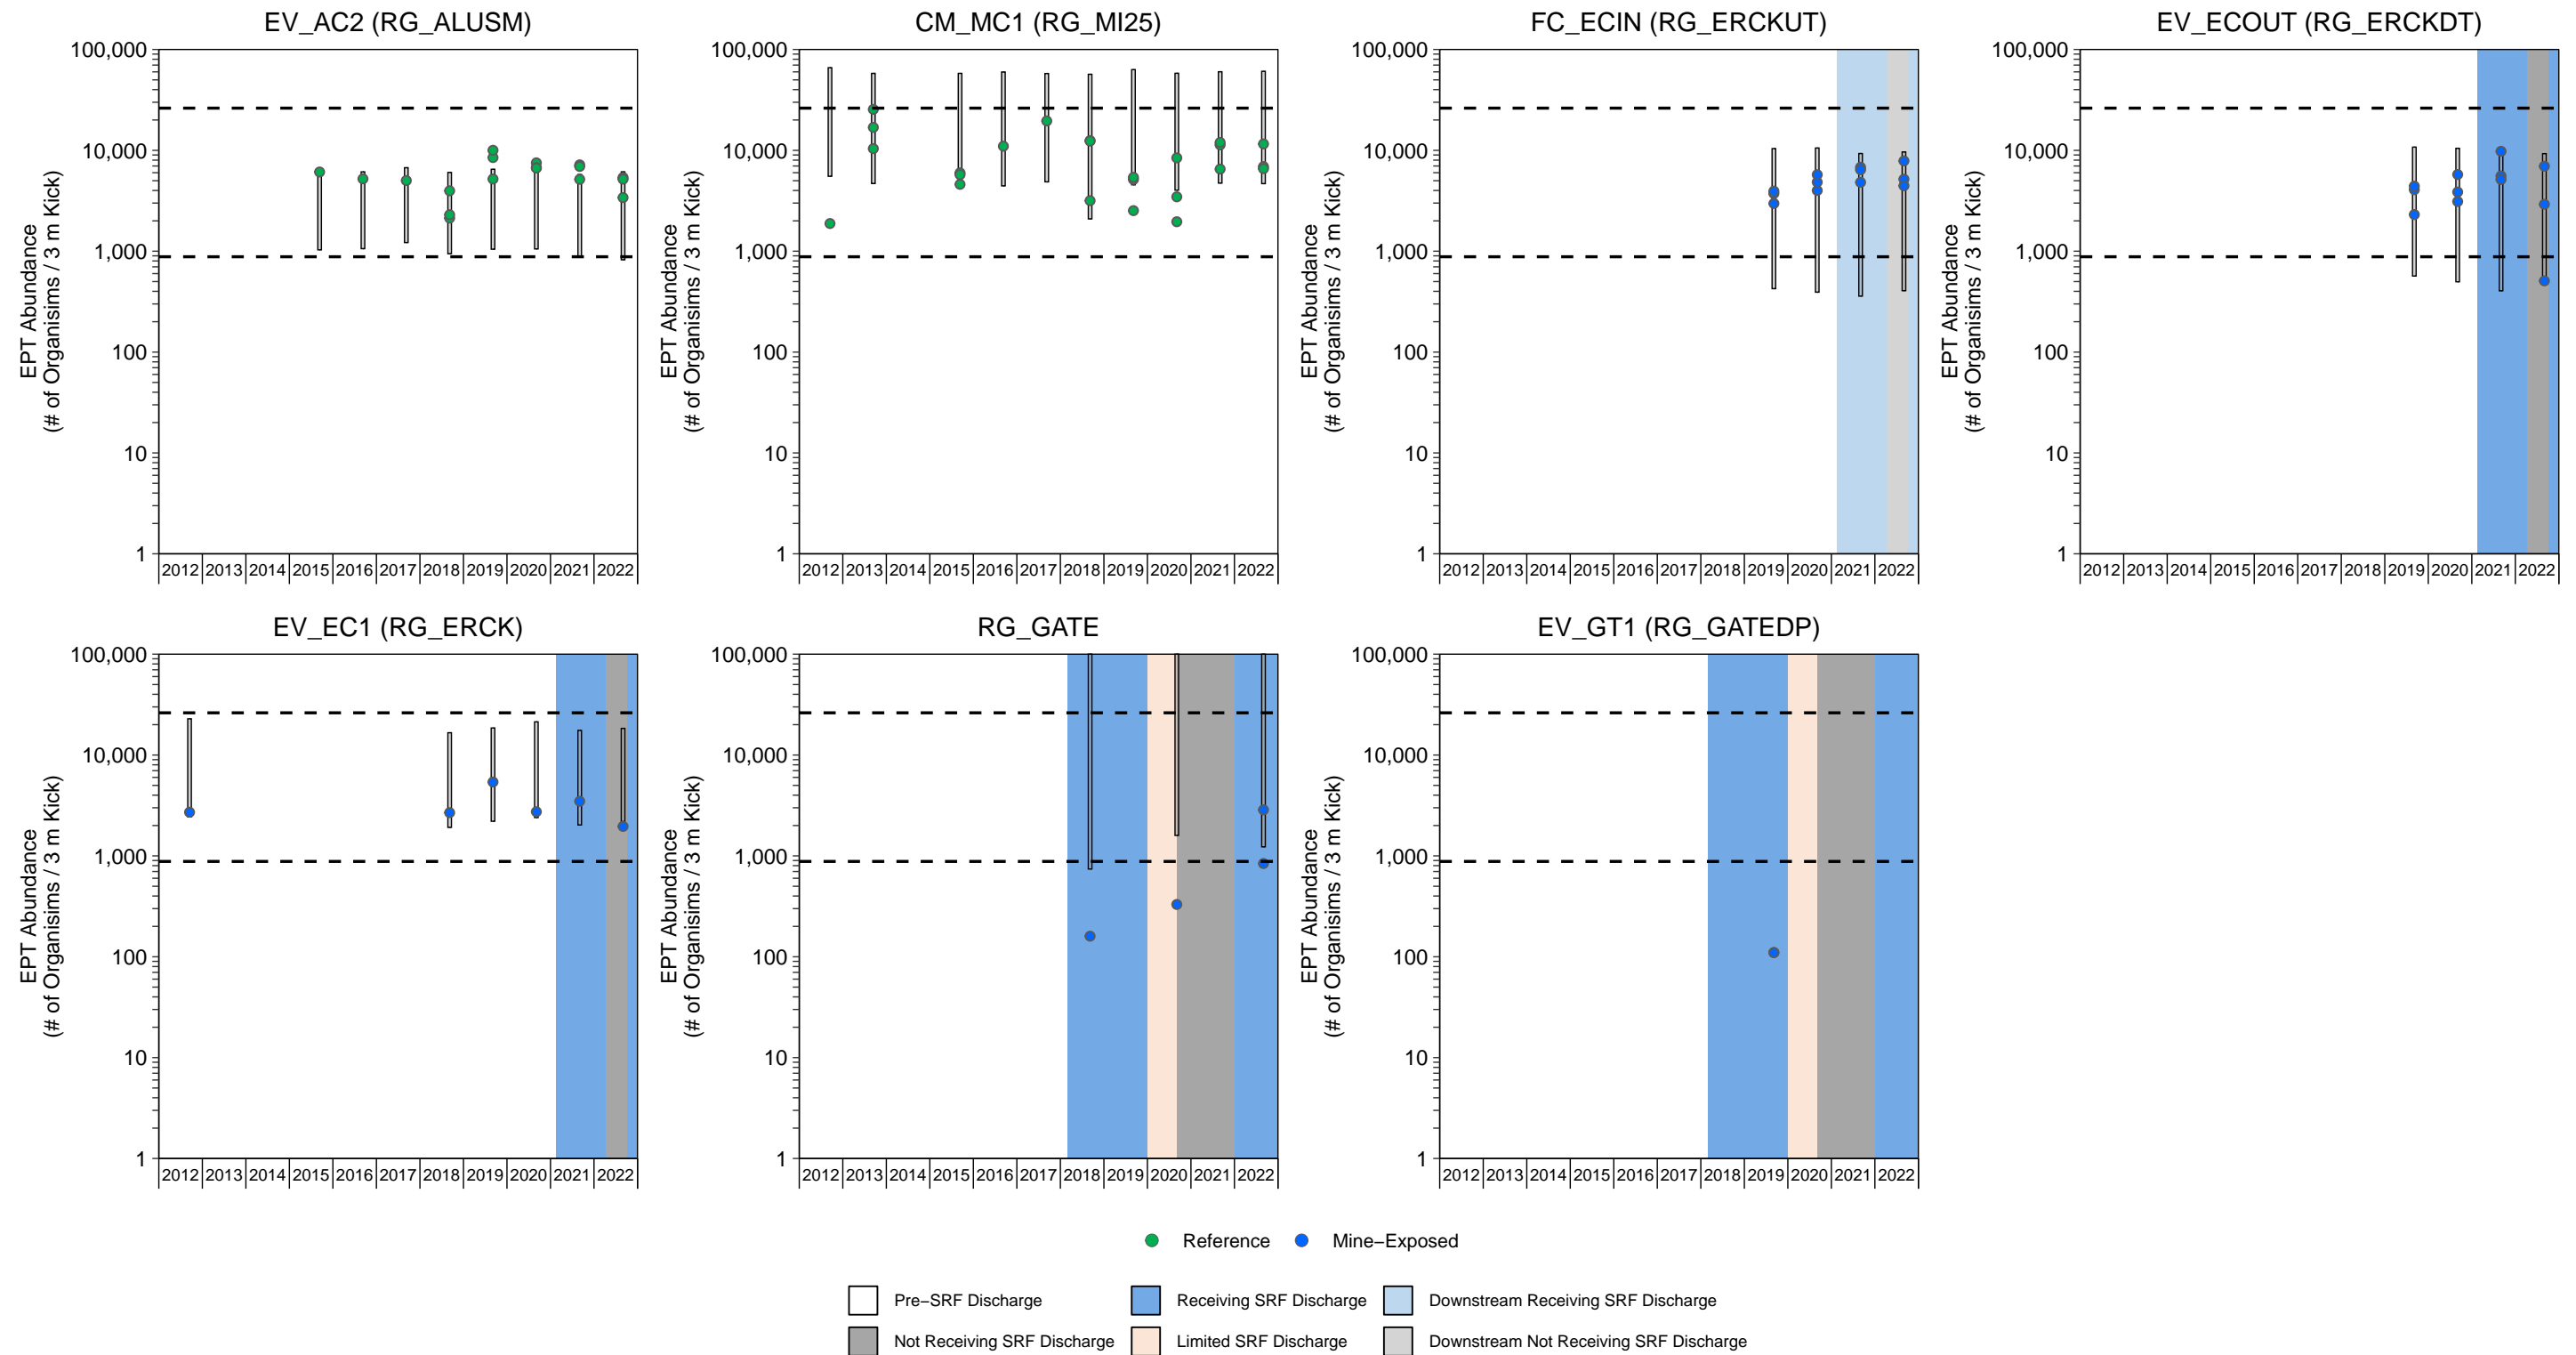

Figure F.3: Benthic Invertebrate Community Endpoints from EVO LAEMP Sampling Areas, September 2012 to 2022

Notes: Site specific normal ranges using regression models shown with grey shading and black rectangle (when available). Normal ranges using percentiles of reference areas from 2012 to 2019 shown as dashed horizontal lines. Values that were close to or equal to 0 were plotted as 1 on the y-axis (on a log₁₀-scale) for abundance

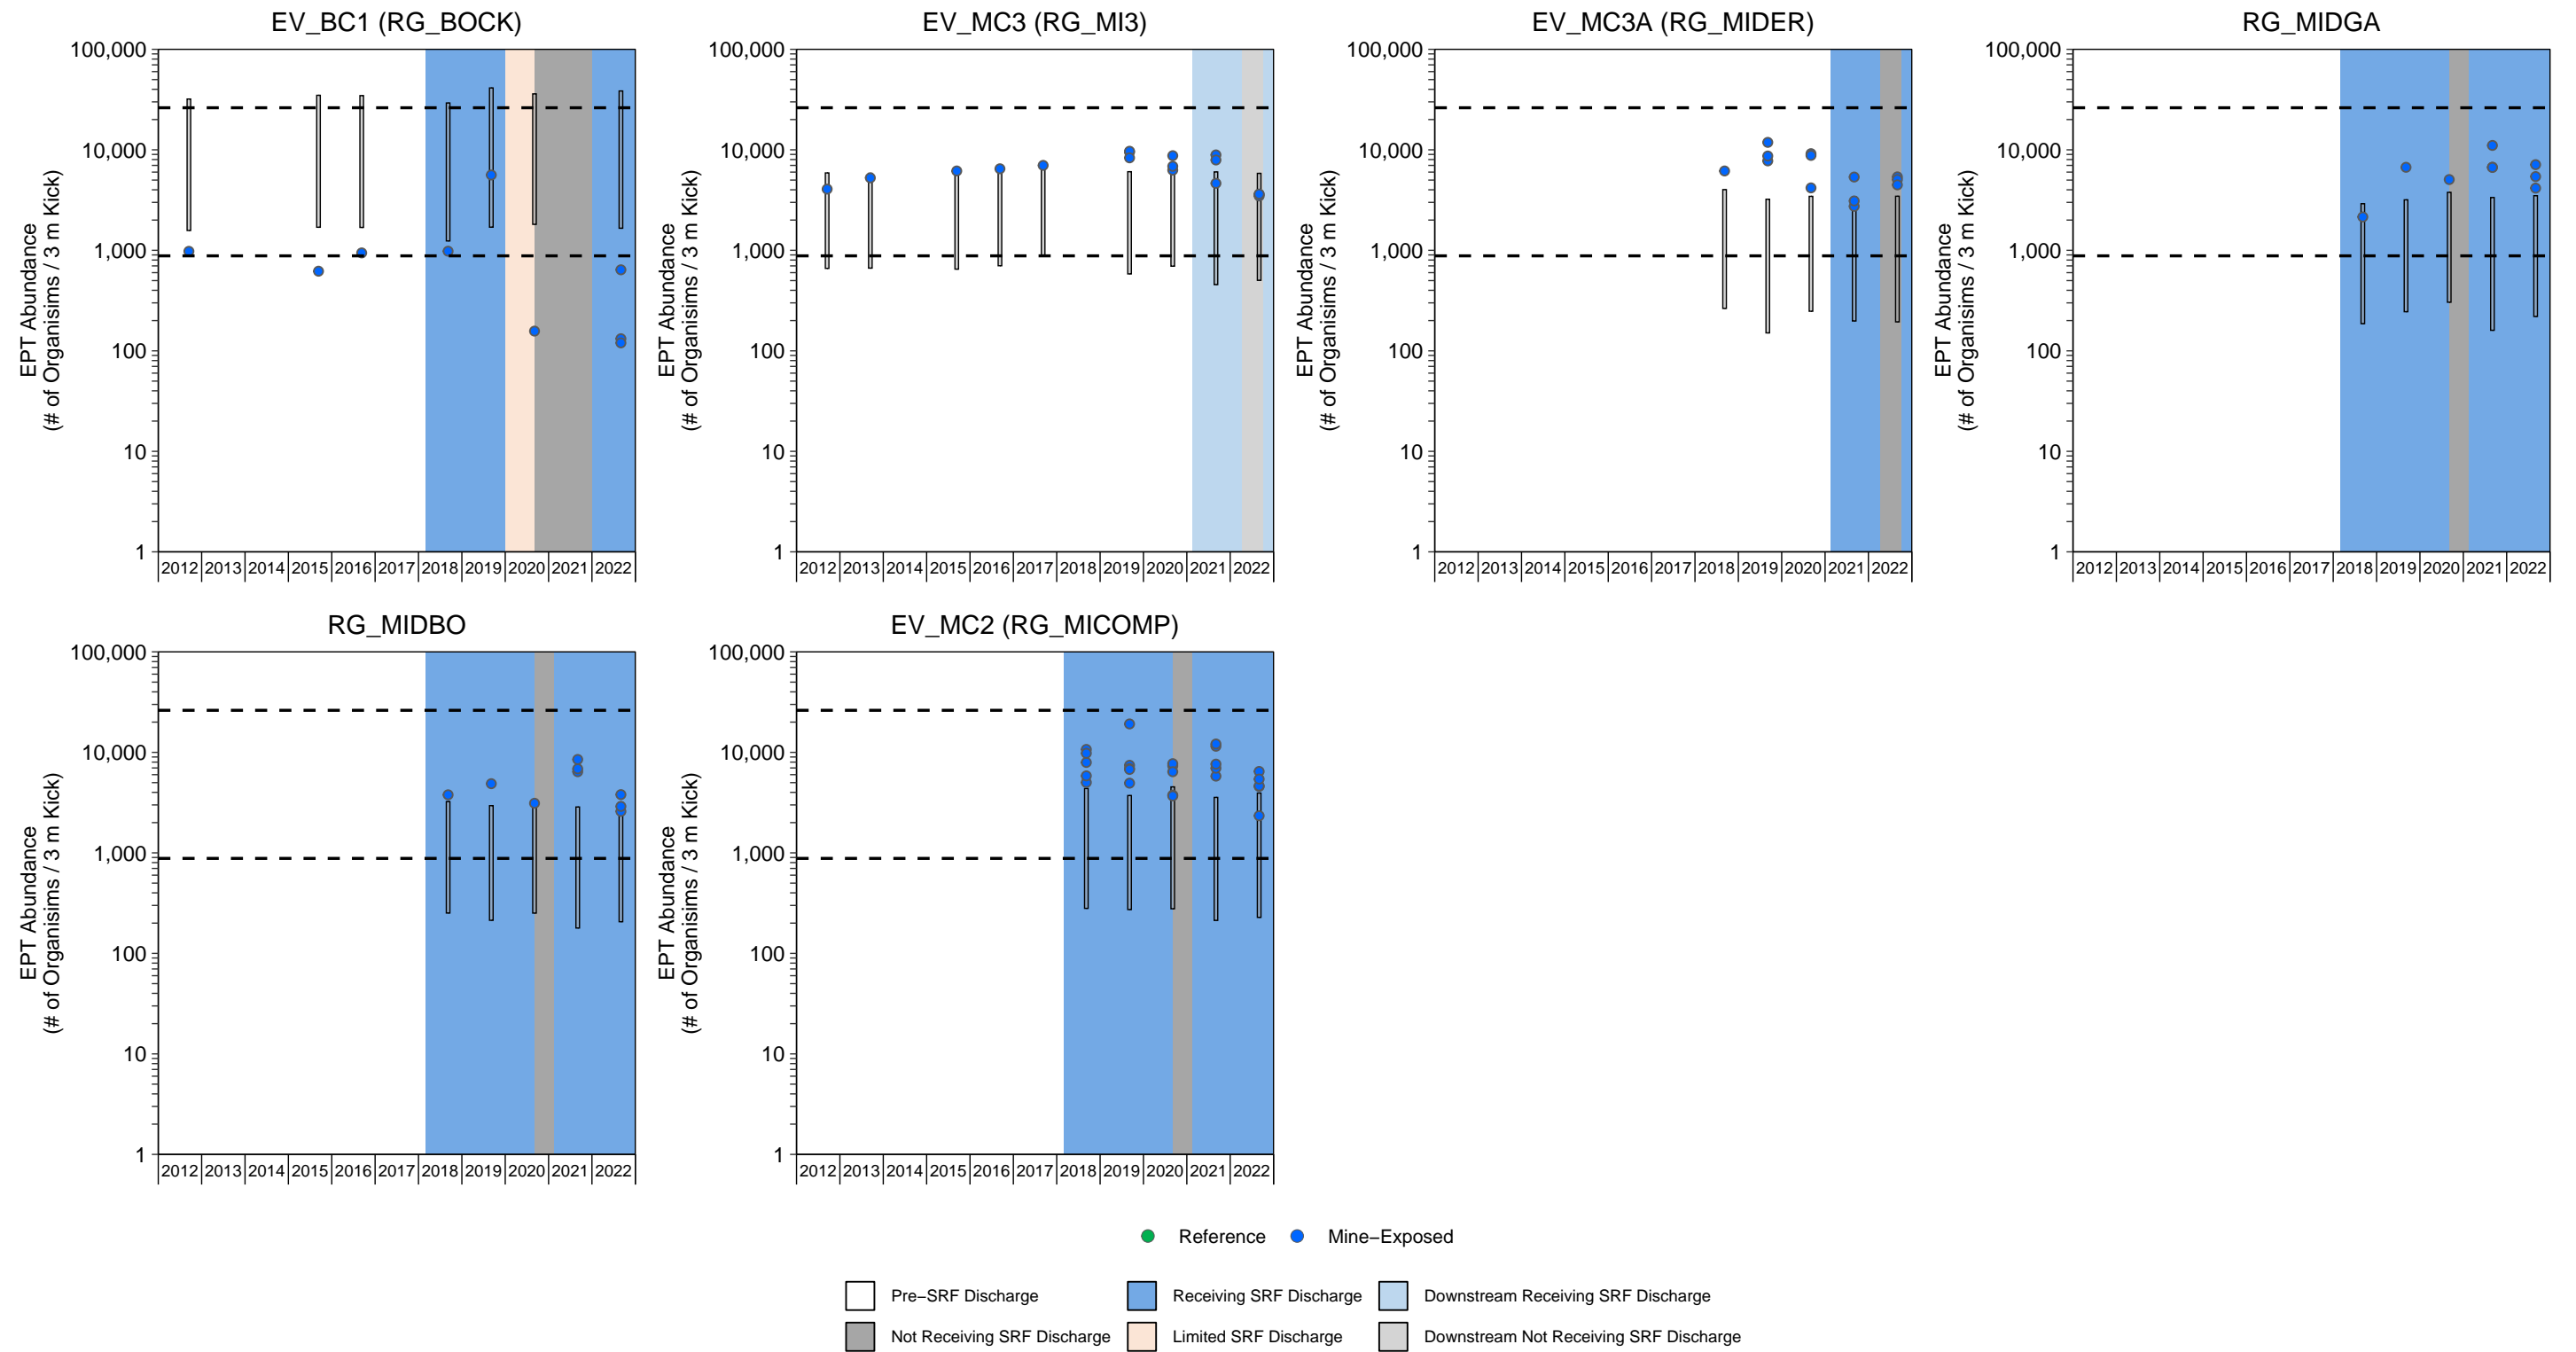

Figure F.3: Benthic Invertebrate Community Endpoints from EVO LAEMP Sampling Areas, September 2012 to 2022

Notes: Site specific normal ranges using regression models shown with grey shading and black rectangle (when available). Normal ranges using percentiles of reference areas from 2012 to 2019 shown as dashed horizontal lines. Values that were close to or equal to 0 were plotted as 1 on the y-axis (on a log₁₀-scale) for abundance

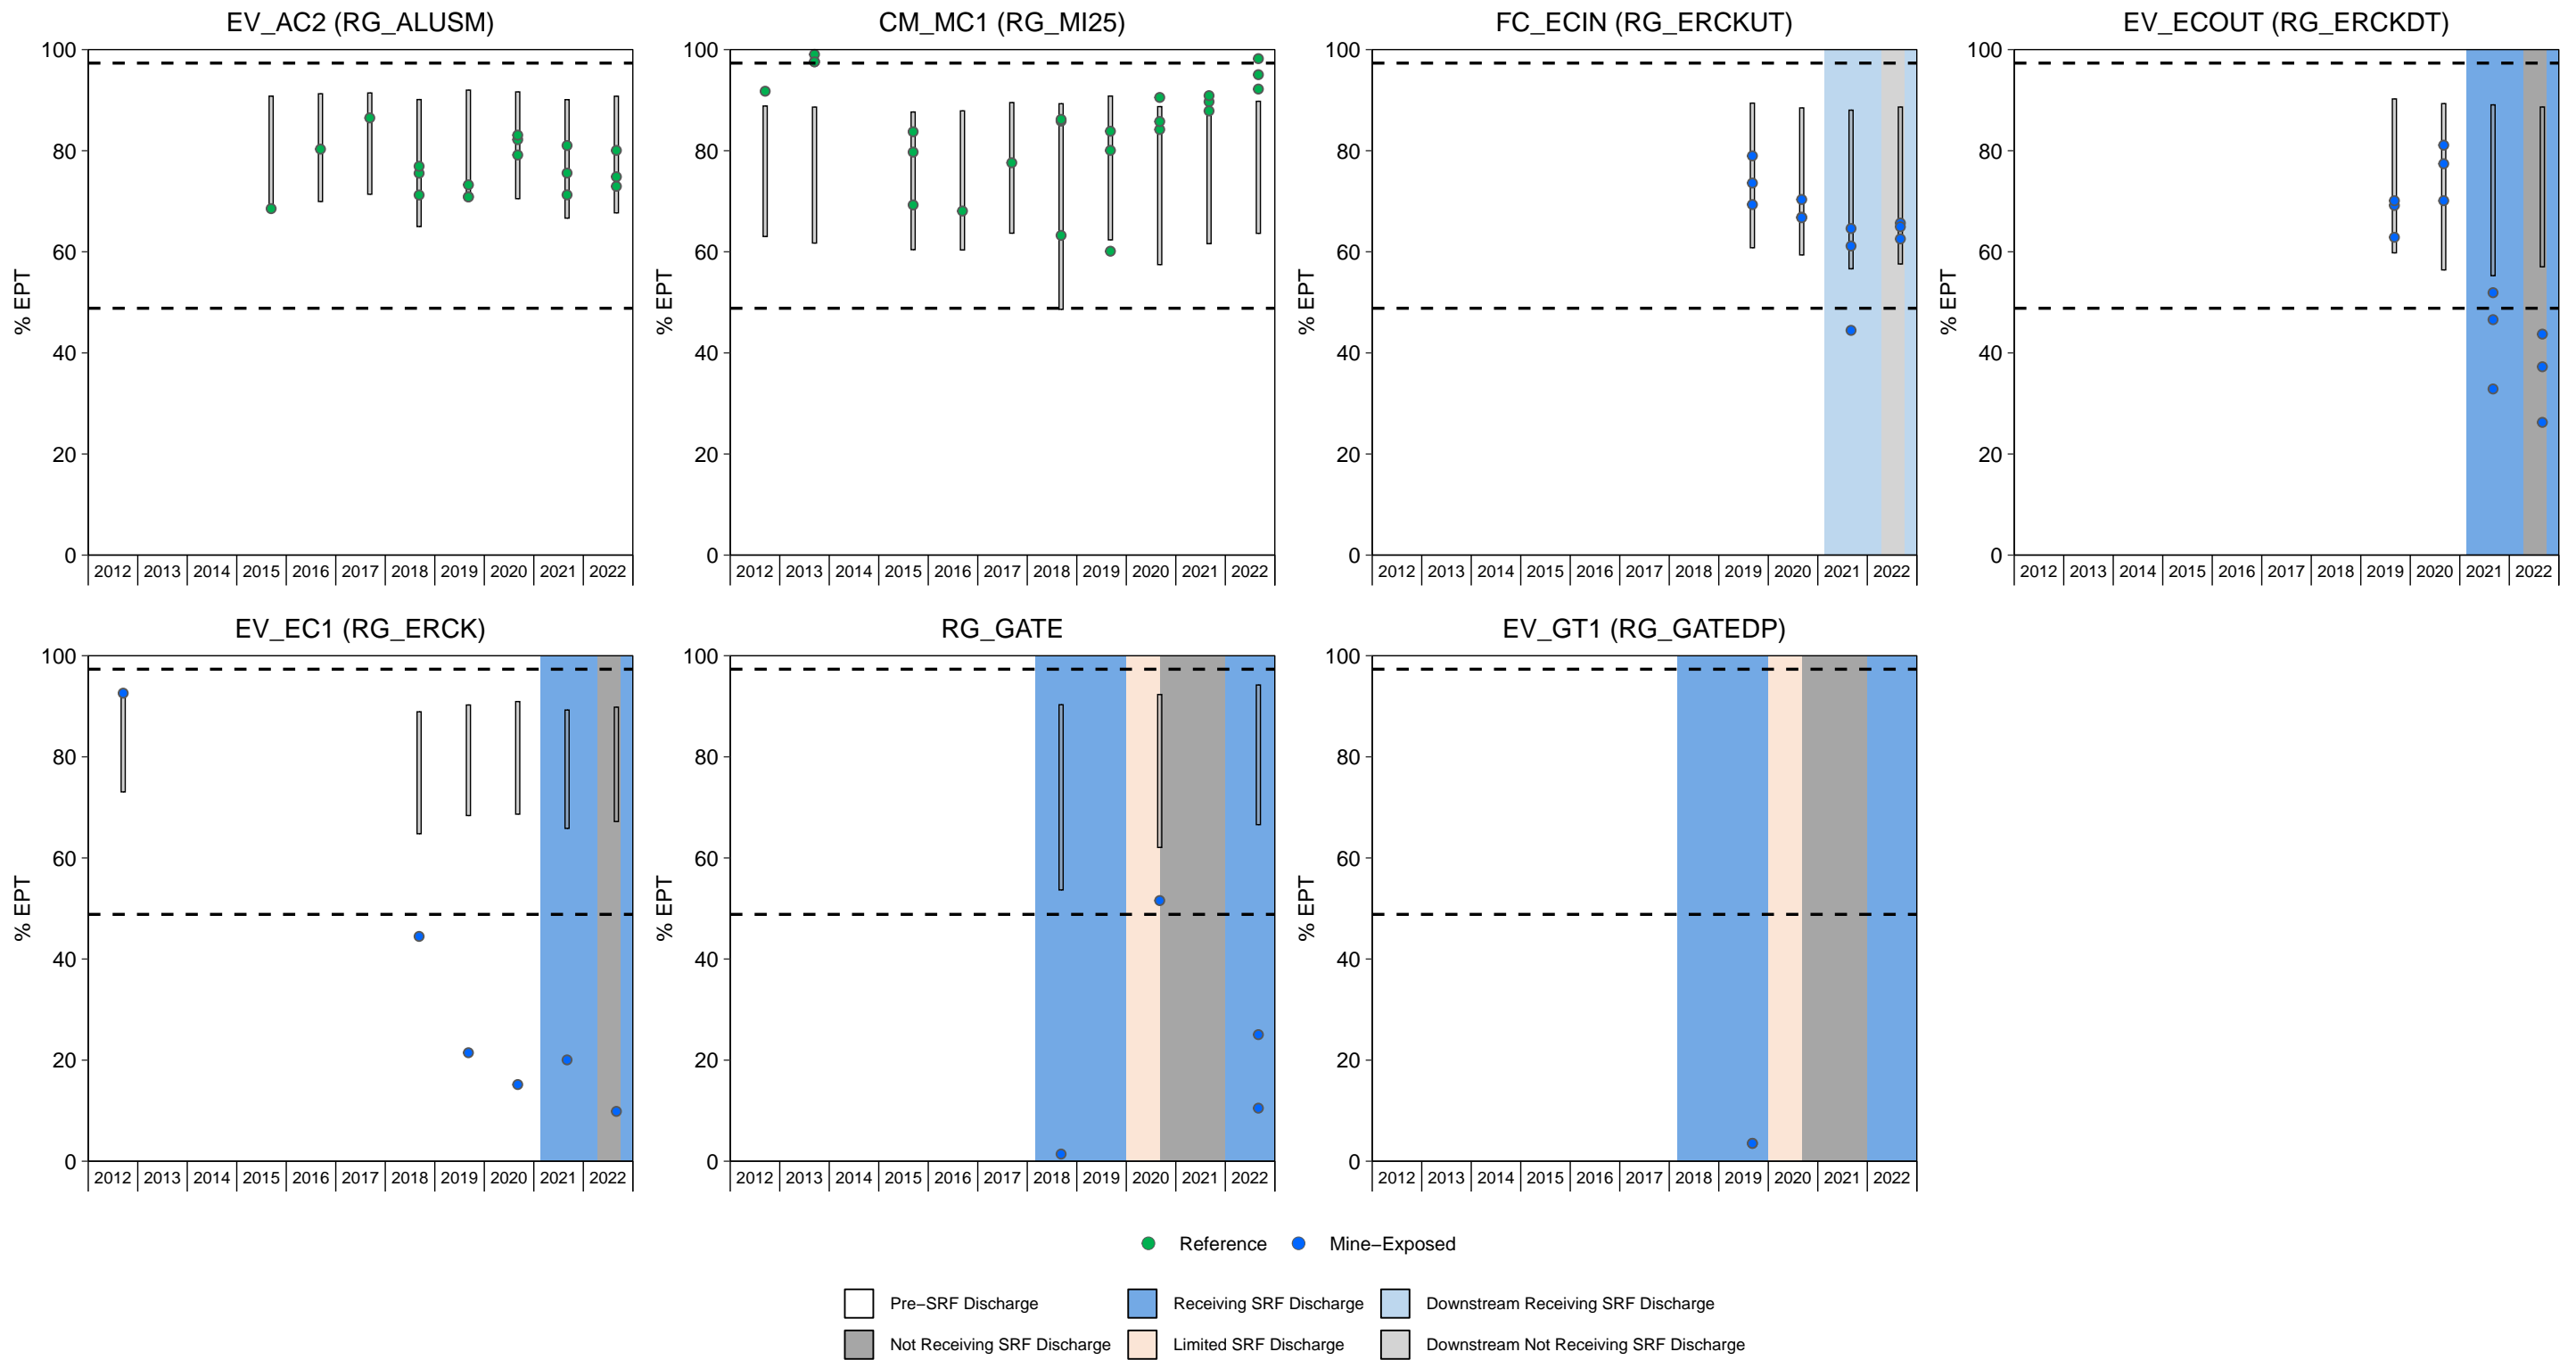

Figure F.4: Benthic Invertebrate Community Endpoints from EVO LAEMP Sampling Areas, September 2012 to 2022

Notes: Site specific normal ranges using regression models shown with grey shading and black rectangle (when available). Normal ranges using percentiles of reference areas from 2012 to 2019 shown as dashed horizontal lines. Values that were close to or equal to 0 were plotted as 1 on the y-axis (on a log₁₀-scale) for abundance

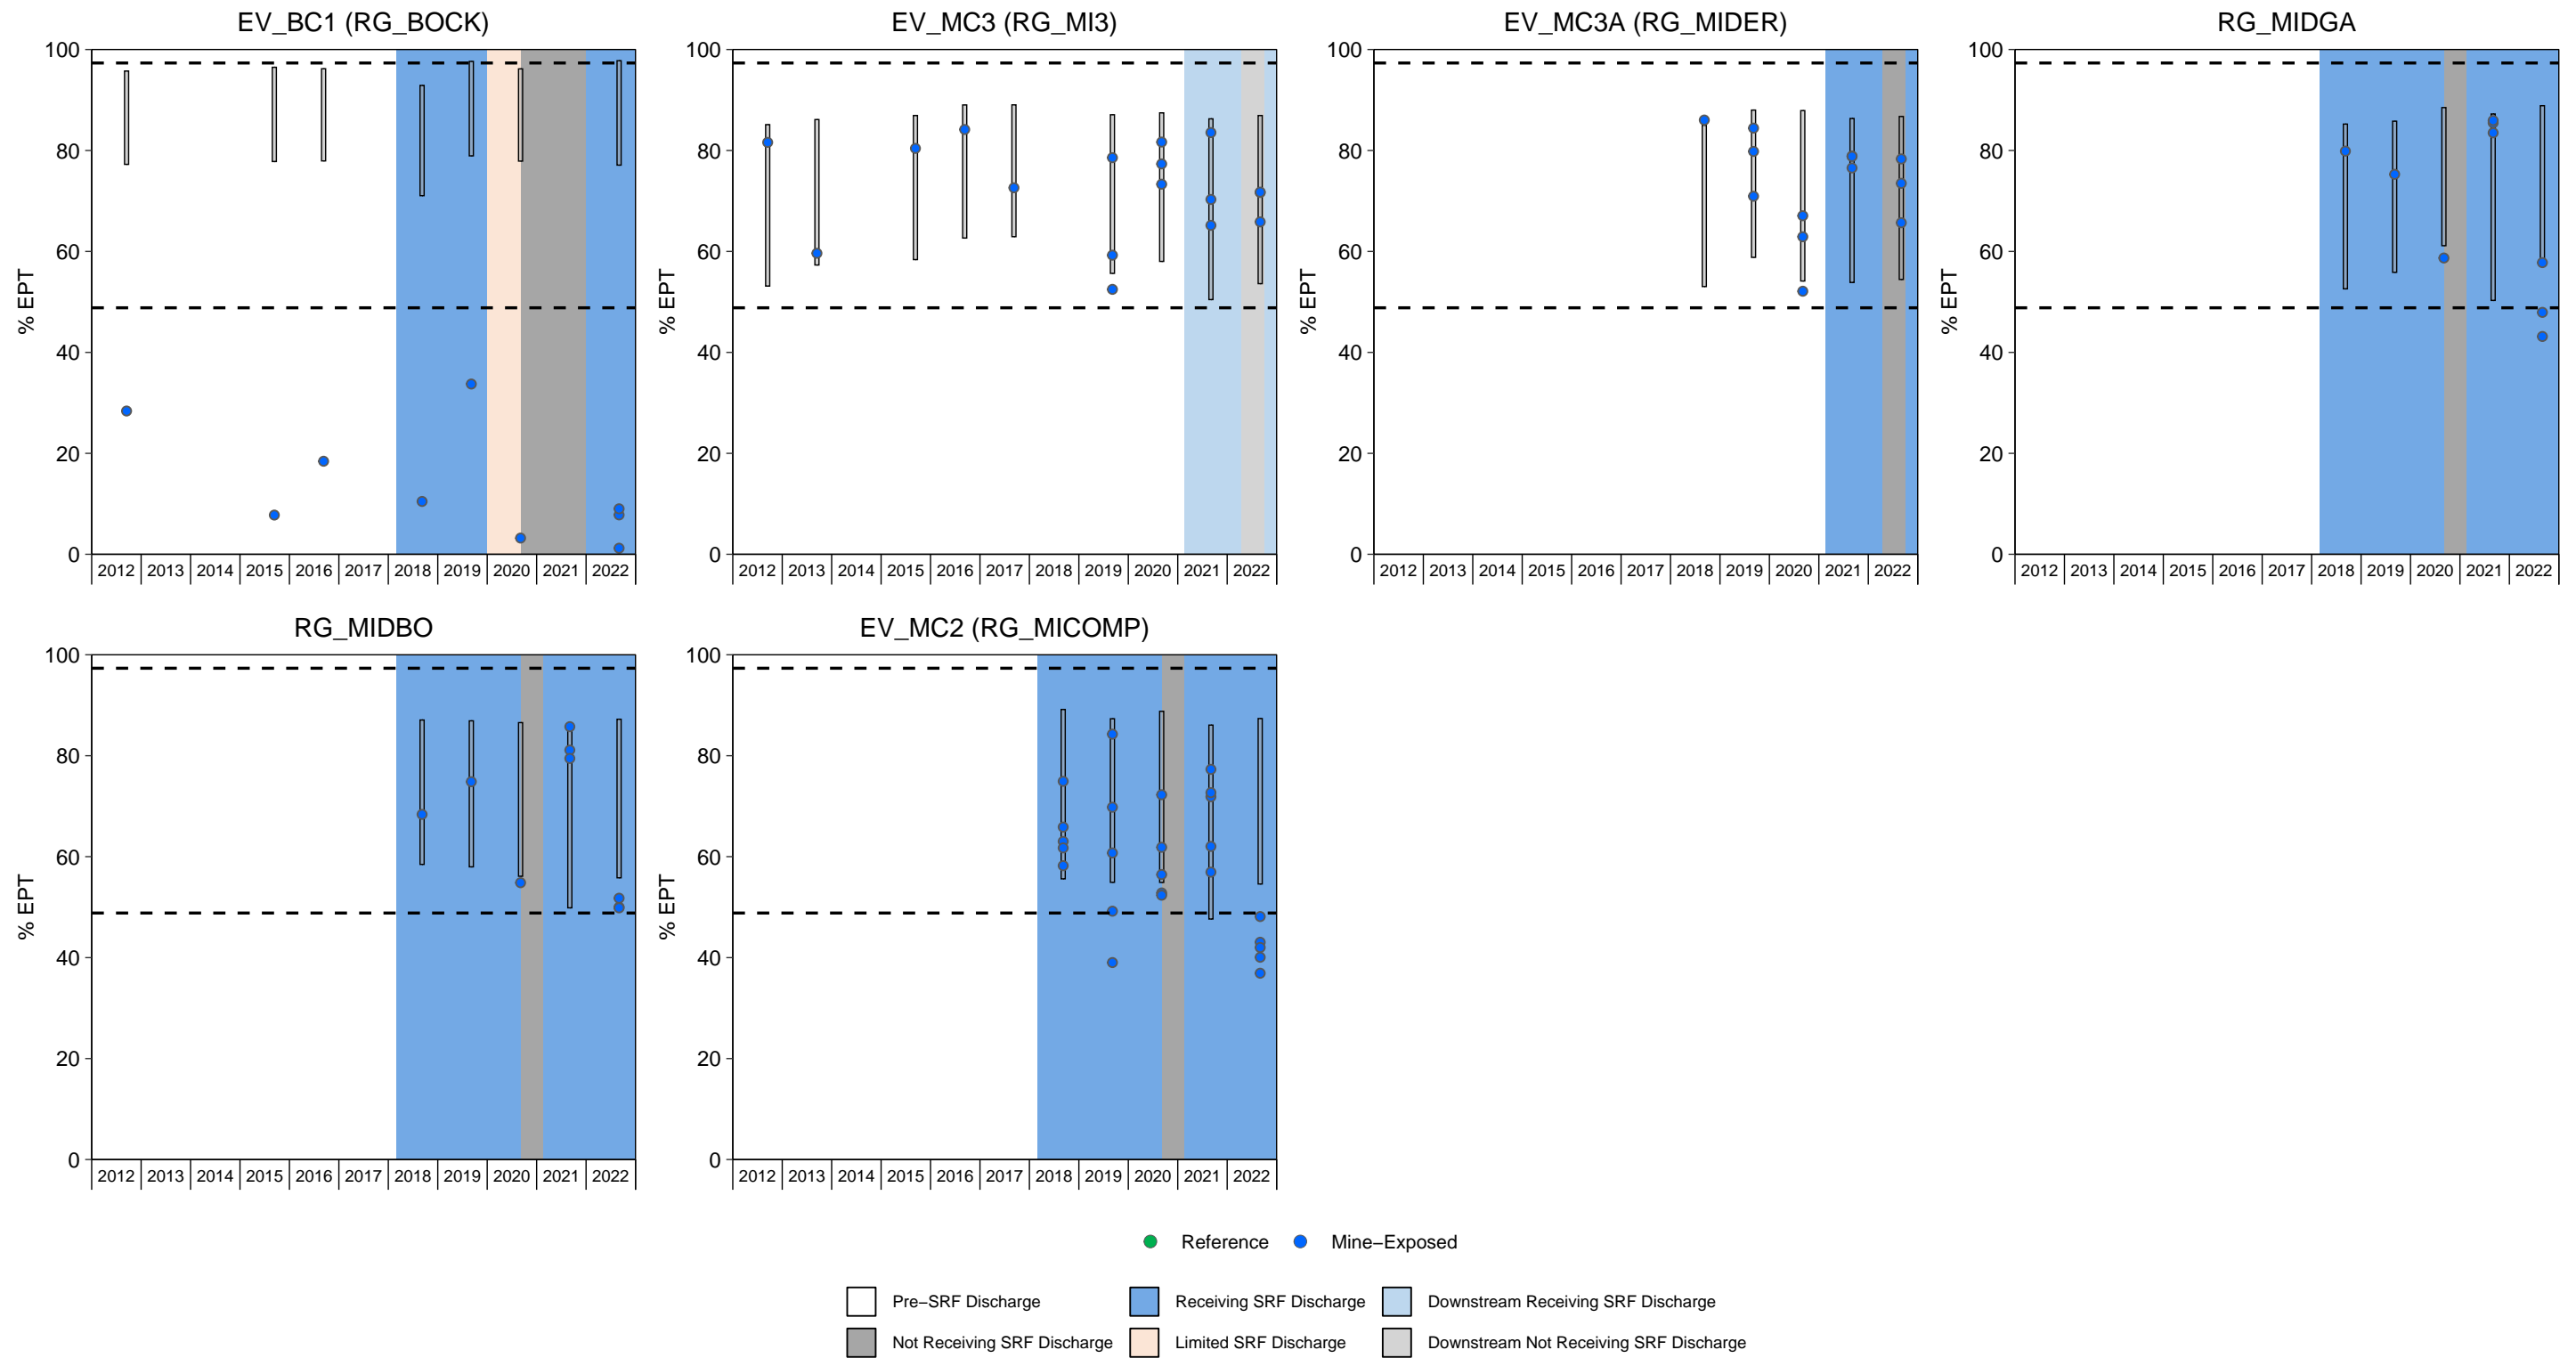

Figure F.4: Benthic Invertebrate Community Endpoints from EVO LAEMP Sampling Areas, September 2012 to 2022

Notes: Site specific normal ranges using regression models shown with grey shading and black rectangle (when available). Figure F.8: Benthic Invertebrate Community Endpoints from EVO LAEMP Sampling Areas, September 2012 to 2022

Notes: Site specific normal ranges using regression models shown with grey shading and black rectangle (when available). Normal ranges using percentiles of reference areas from 2012 to 2019 shown as dashed horizontal lines. Values that were close to or equal to 0 were plotted as 1 on the y-axis (on a log₁₀-scale) for abundance

Figure F.8: Benthic Invertebrate Community Endpoints from EVO LAEMP Sampling Areas, September 2012 to 2022

Notes: Site specific normal ranges using regression models shown with grey shading and black rectangle (when available). Normal ranges using percentiles of reference areas from 2012 to 2019 shown as dashed horizontal lines. Values that were close to or equal to 0 were plotted as 1 on the y-axis (on a log₁₀-scale) for abundance

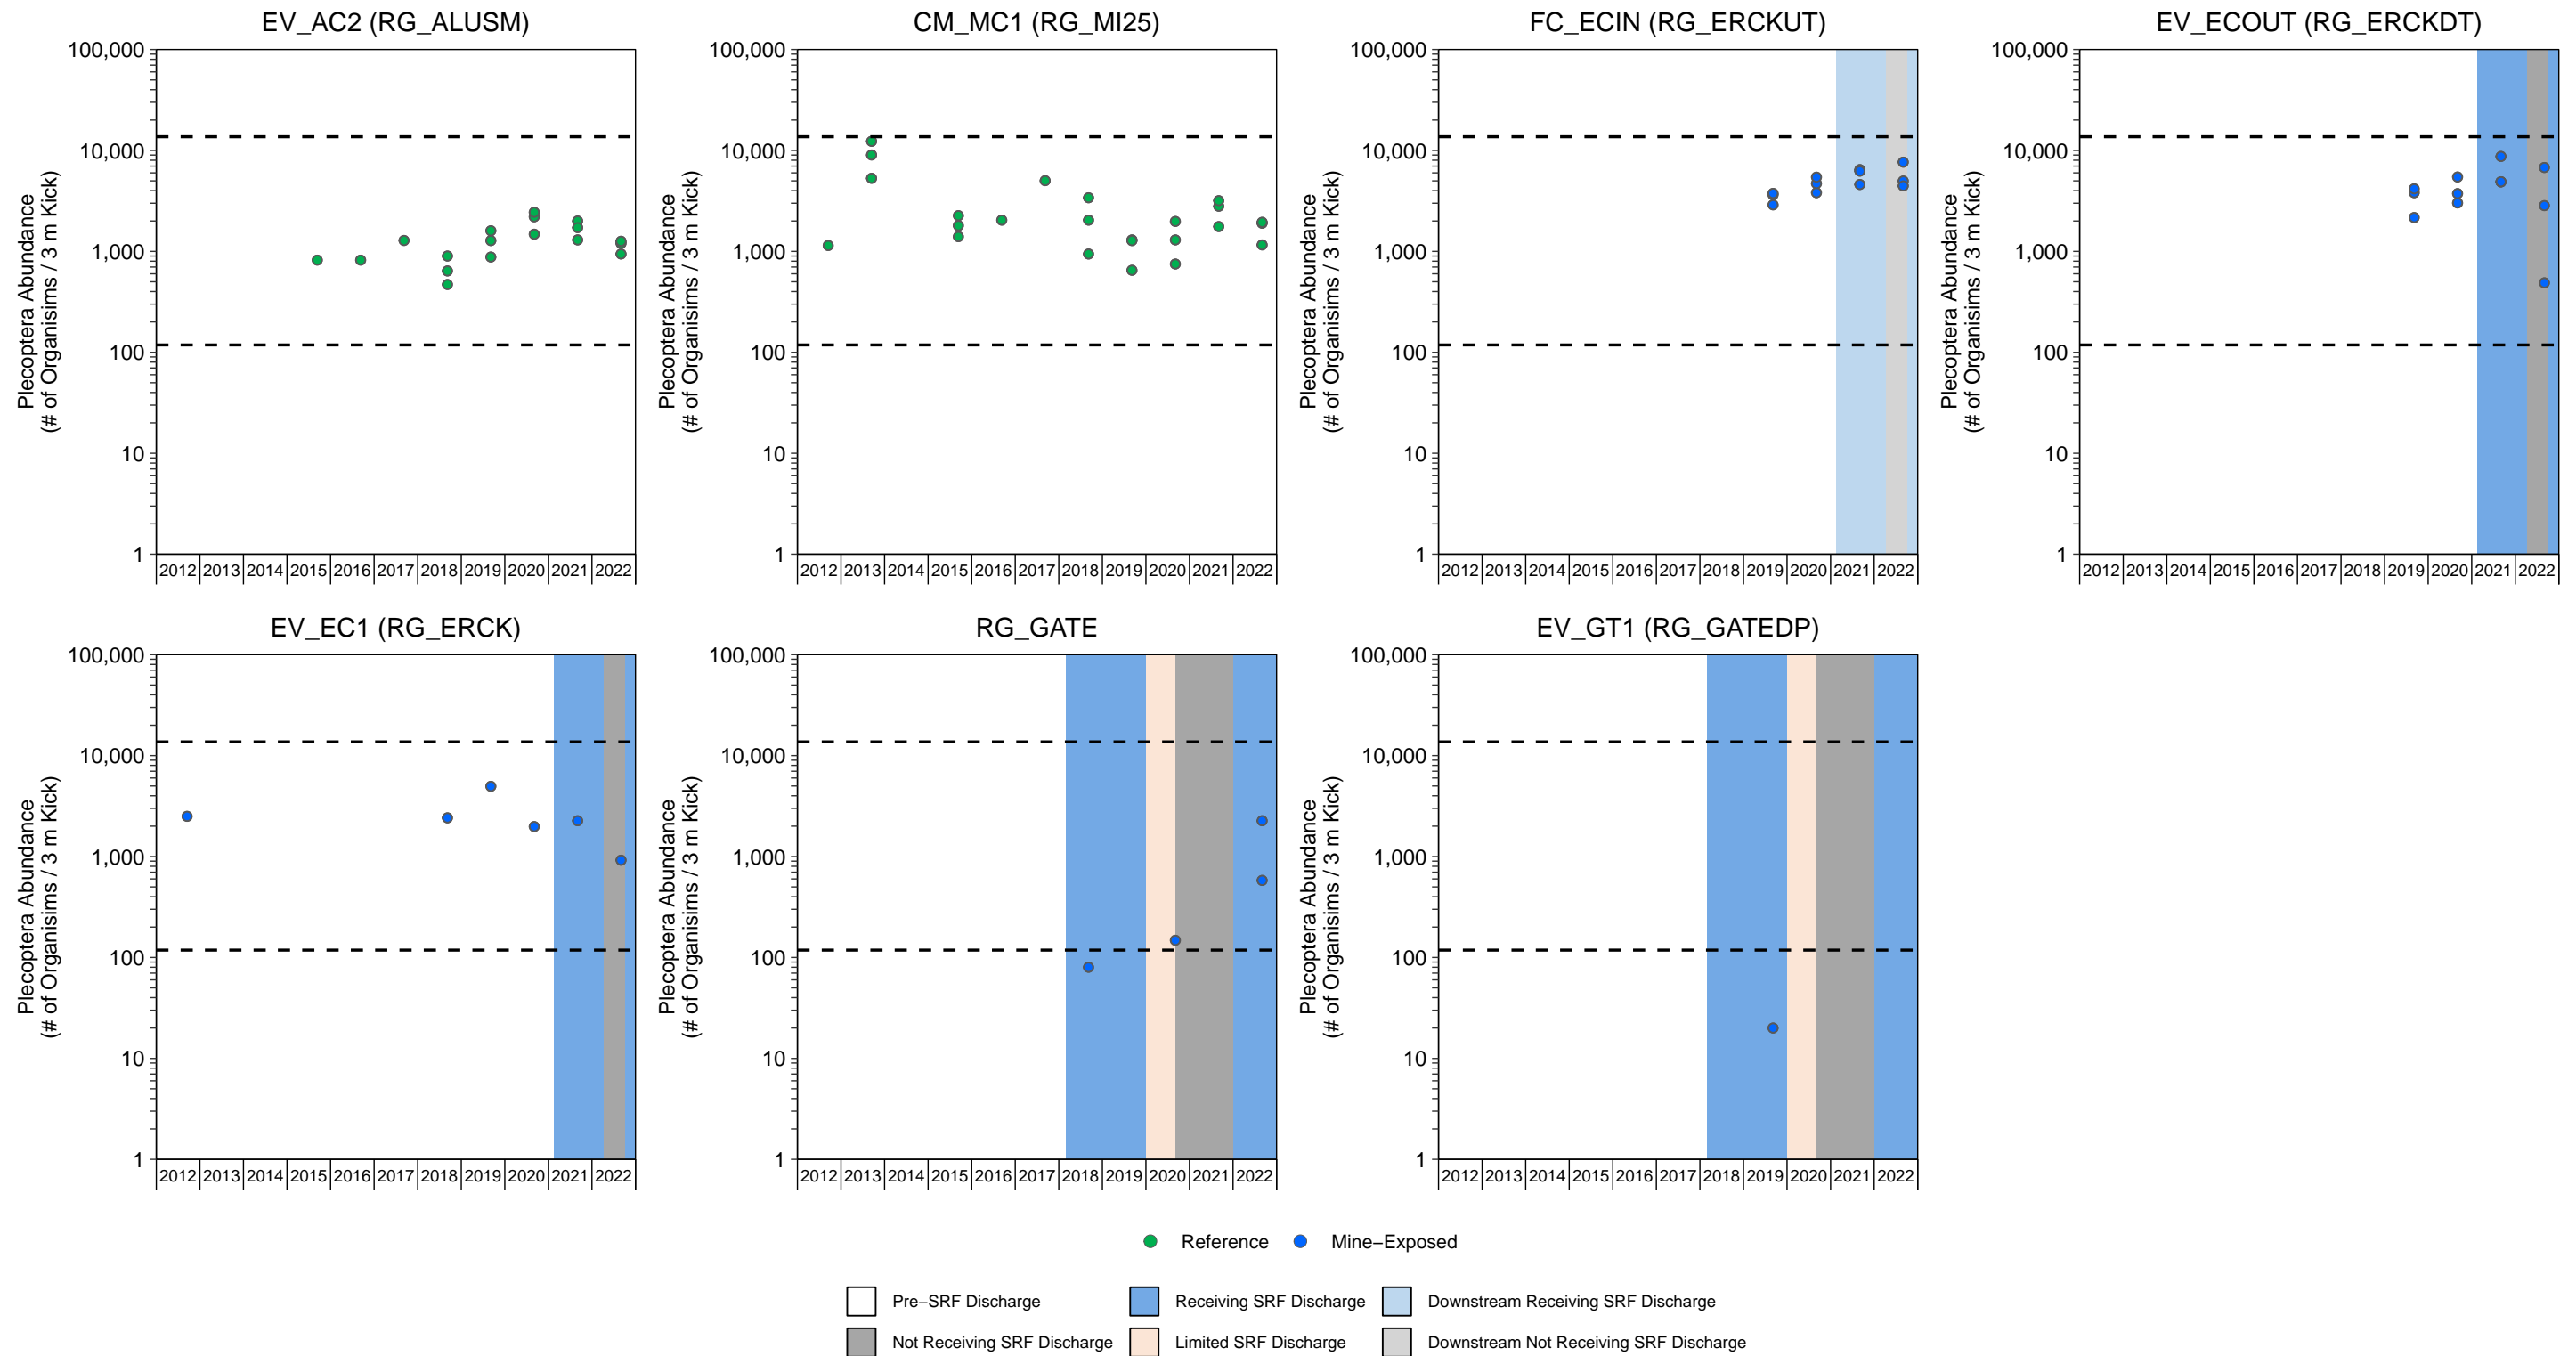

Figure 9.9: Benthic Invertebrate Community Endpoints from EVO LAEMP Sampling Areas, September 2012 to 2022

Notes: Site specific normal ranges using regression models shown with grey shading and black rectangle (when available). Normal ranges using percentiles of reference areas from 2012 to 2019 shown as dashed horizontal lines. Values that were close to or equal to 0 were plotted as 1 on the y-axis (on a log₁₀-scale) for abundance

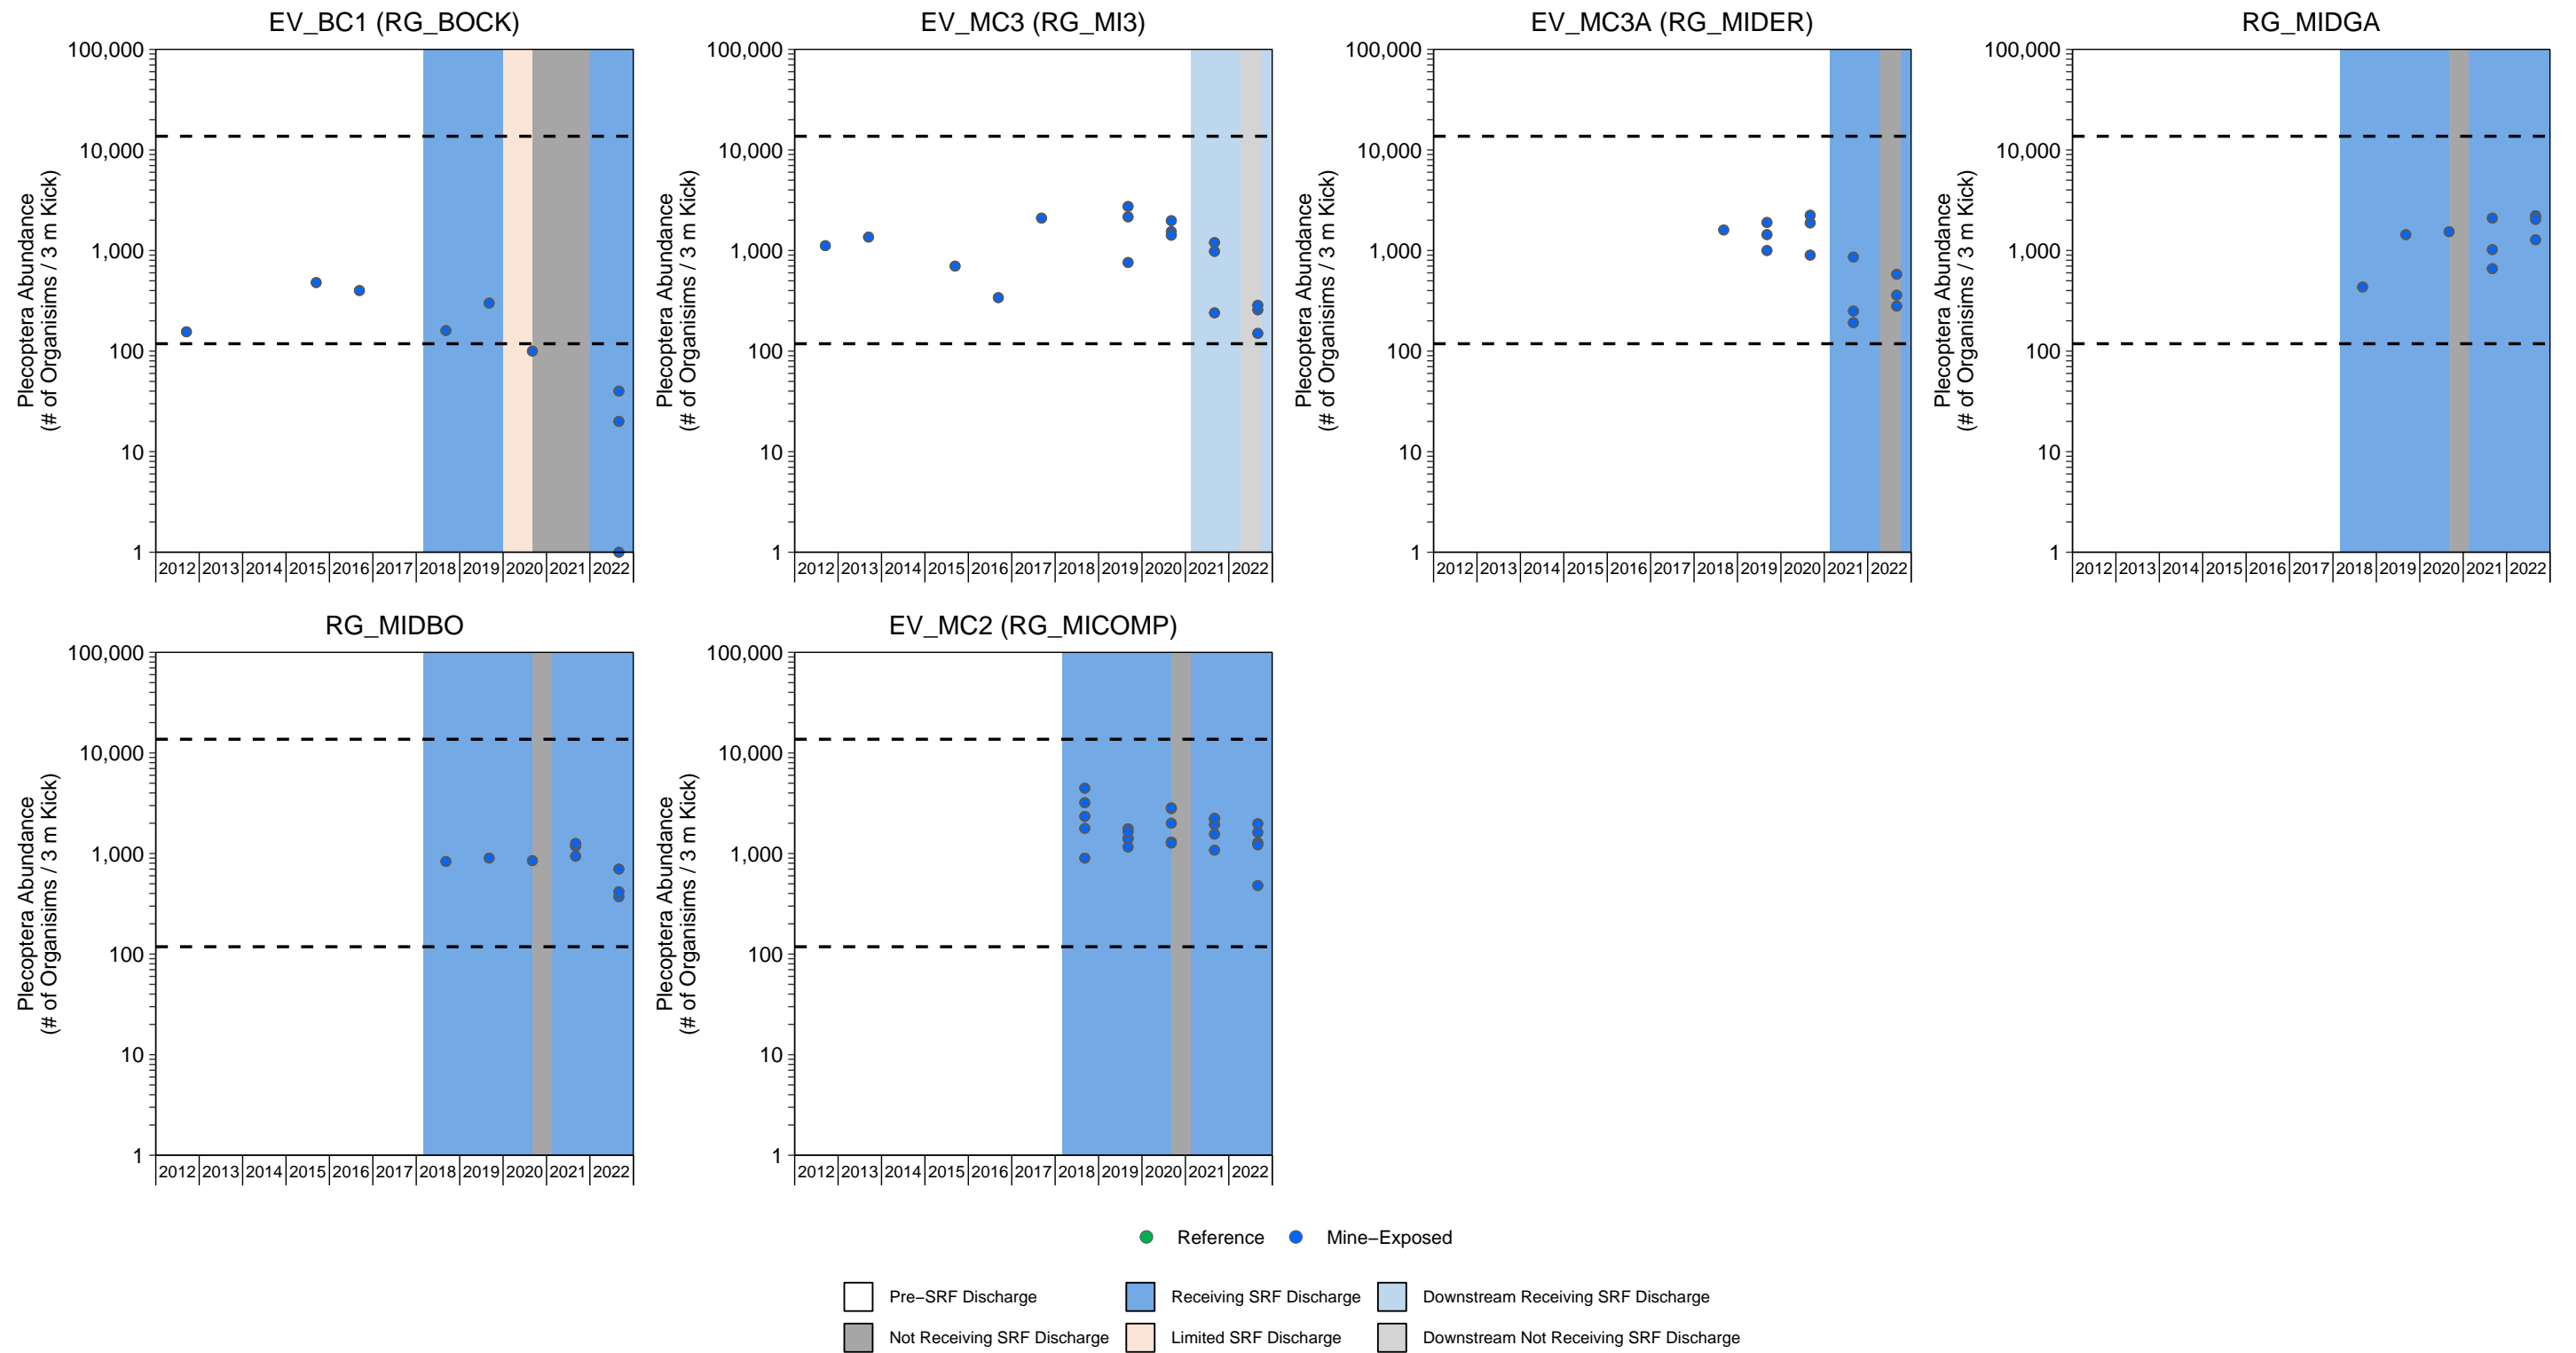

Figure F.9: Benthic Invertebrate Community Endpoints from EVO LAEMP Sampling Areas, September 2012 to 2022

Notes: Site specific normal ranges using regression models shown with grey shading and black rectangle (when available). Normal ranges using percentiles of reference areas from 2012 to 2019 shown as dashed horizontal lines. Values that were close to or equal to 0 were plotted as 1 on the y-axis (on a log₁₀-scale) for abundance

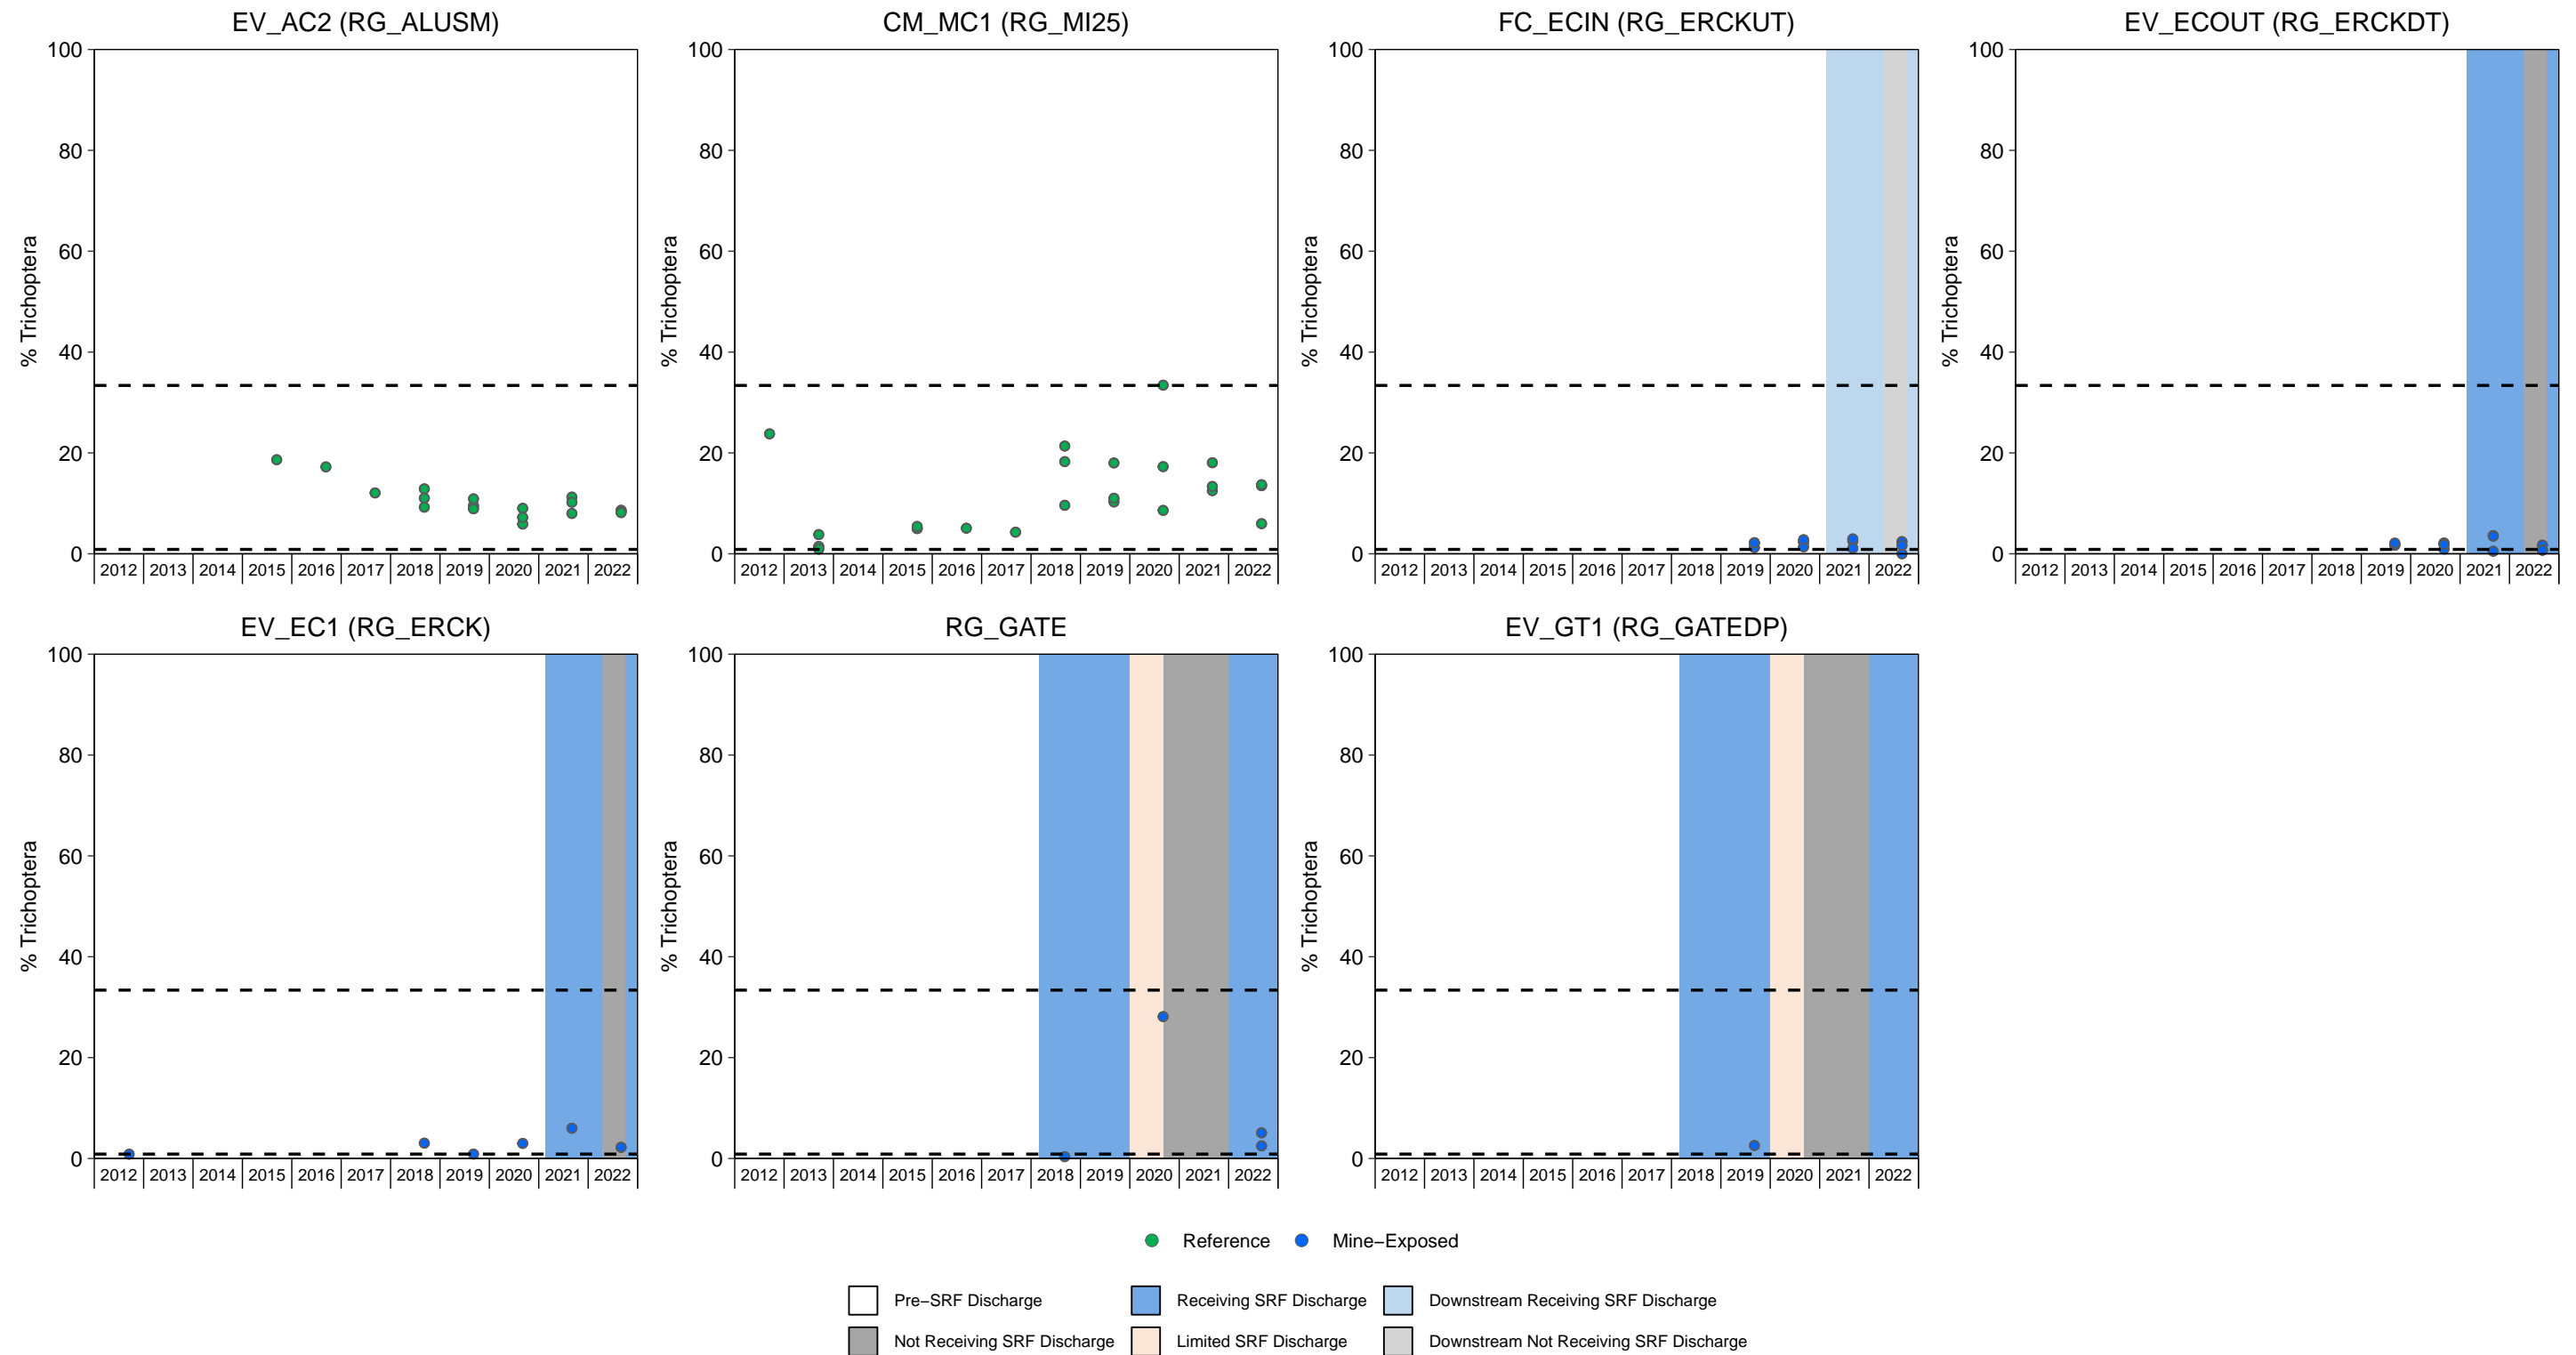

Figure F.10: Benthic Invertebrate Community Endpoints from EVO LAEMP Sampling Areas, September 2012 to 2022

Notes: Site specific normal ranges using regression models shown with grey shading and black rectangle (when available). Normal ranges using percentiles of reference areas from 2012 to 2019 shown as dashed horizontal lines. Values that were close to or equal to 0 were plotted as 1 on the y-axis (on a log₁₀-scale) for abundance

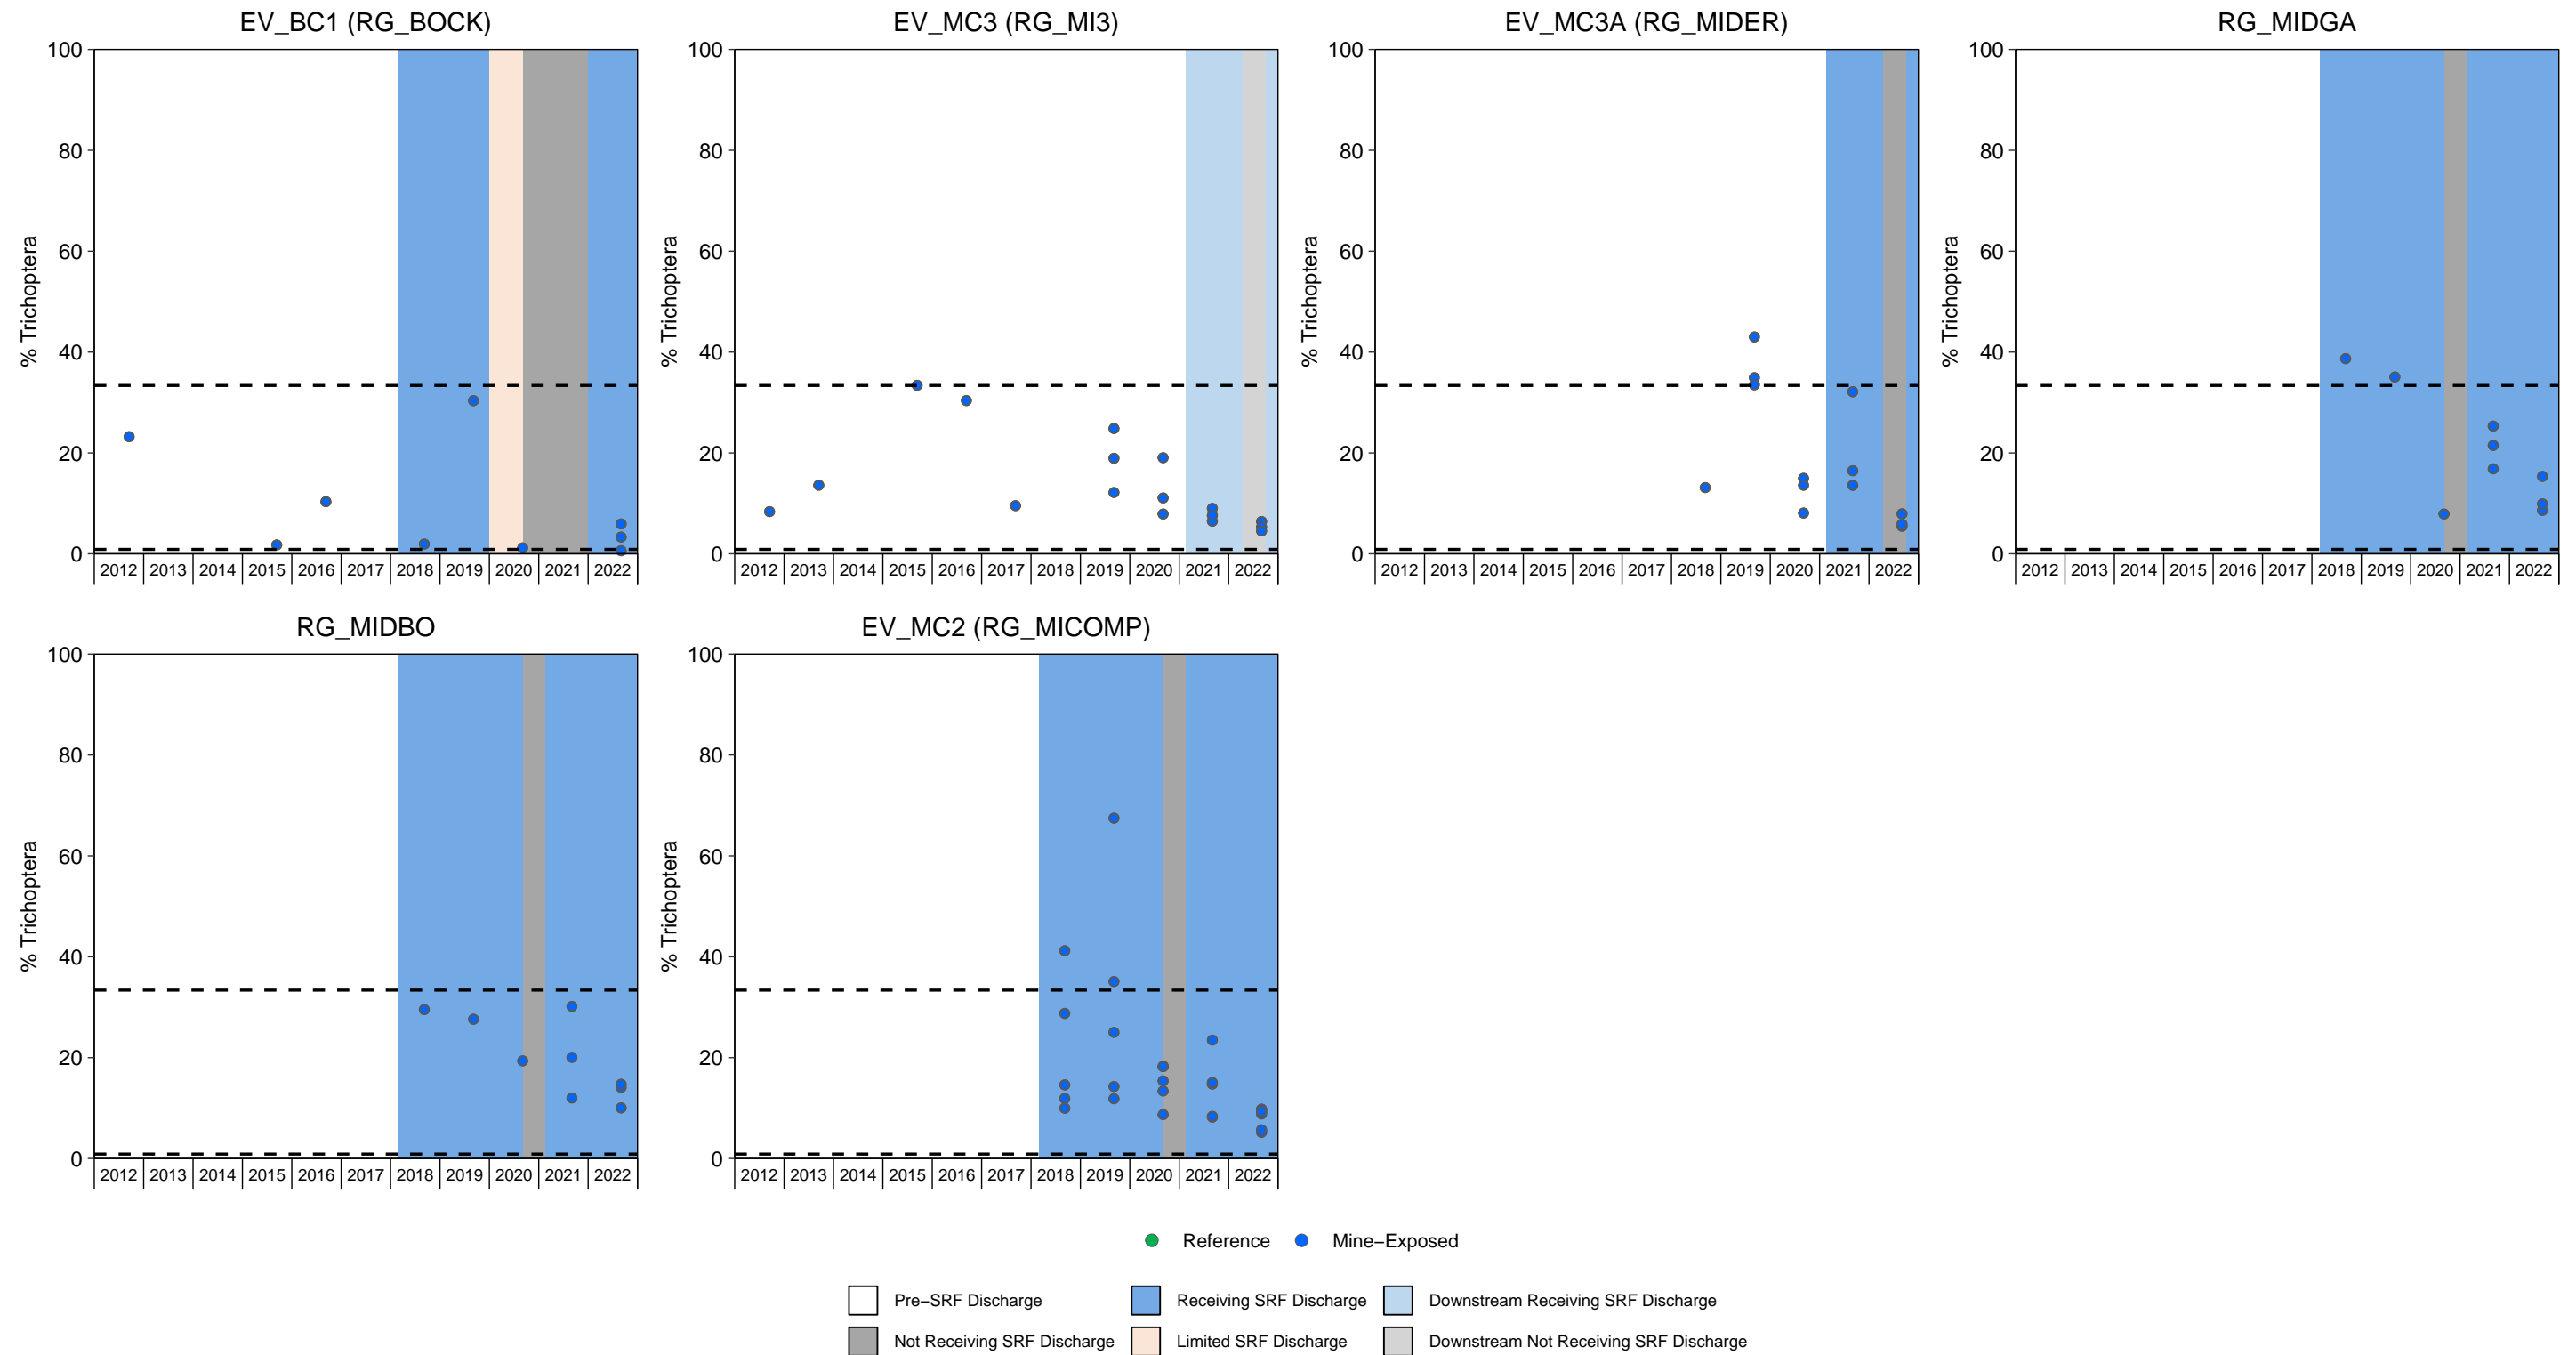

Figure F.10: Benthic Invertebrate Community Endpoints from EVO LAEMP Sampling Areas, September 2012 to 2022

Notes: Site specific normal ranges using regression models shown with grey shading and black rectangle (when available). Normal ranges using percentiles of reference areas from 2012 to 2019 shown as dashed horizontal lines. Values that were close to or equal to 0 were plotted as 1 on the y-axis (on a log₁₀-scale) for abundance

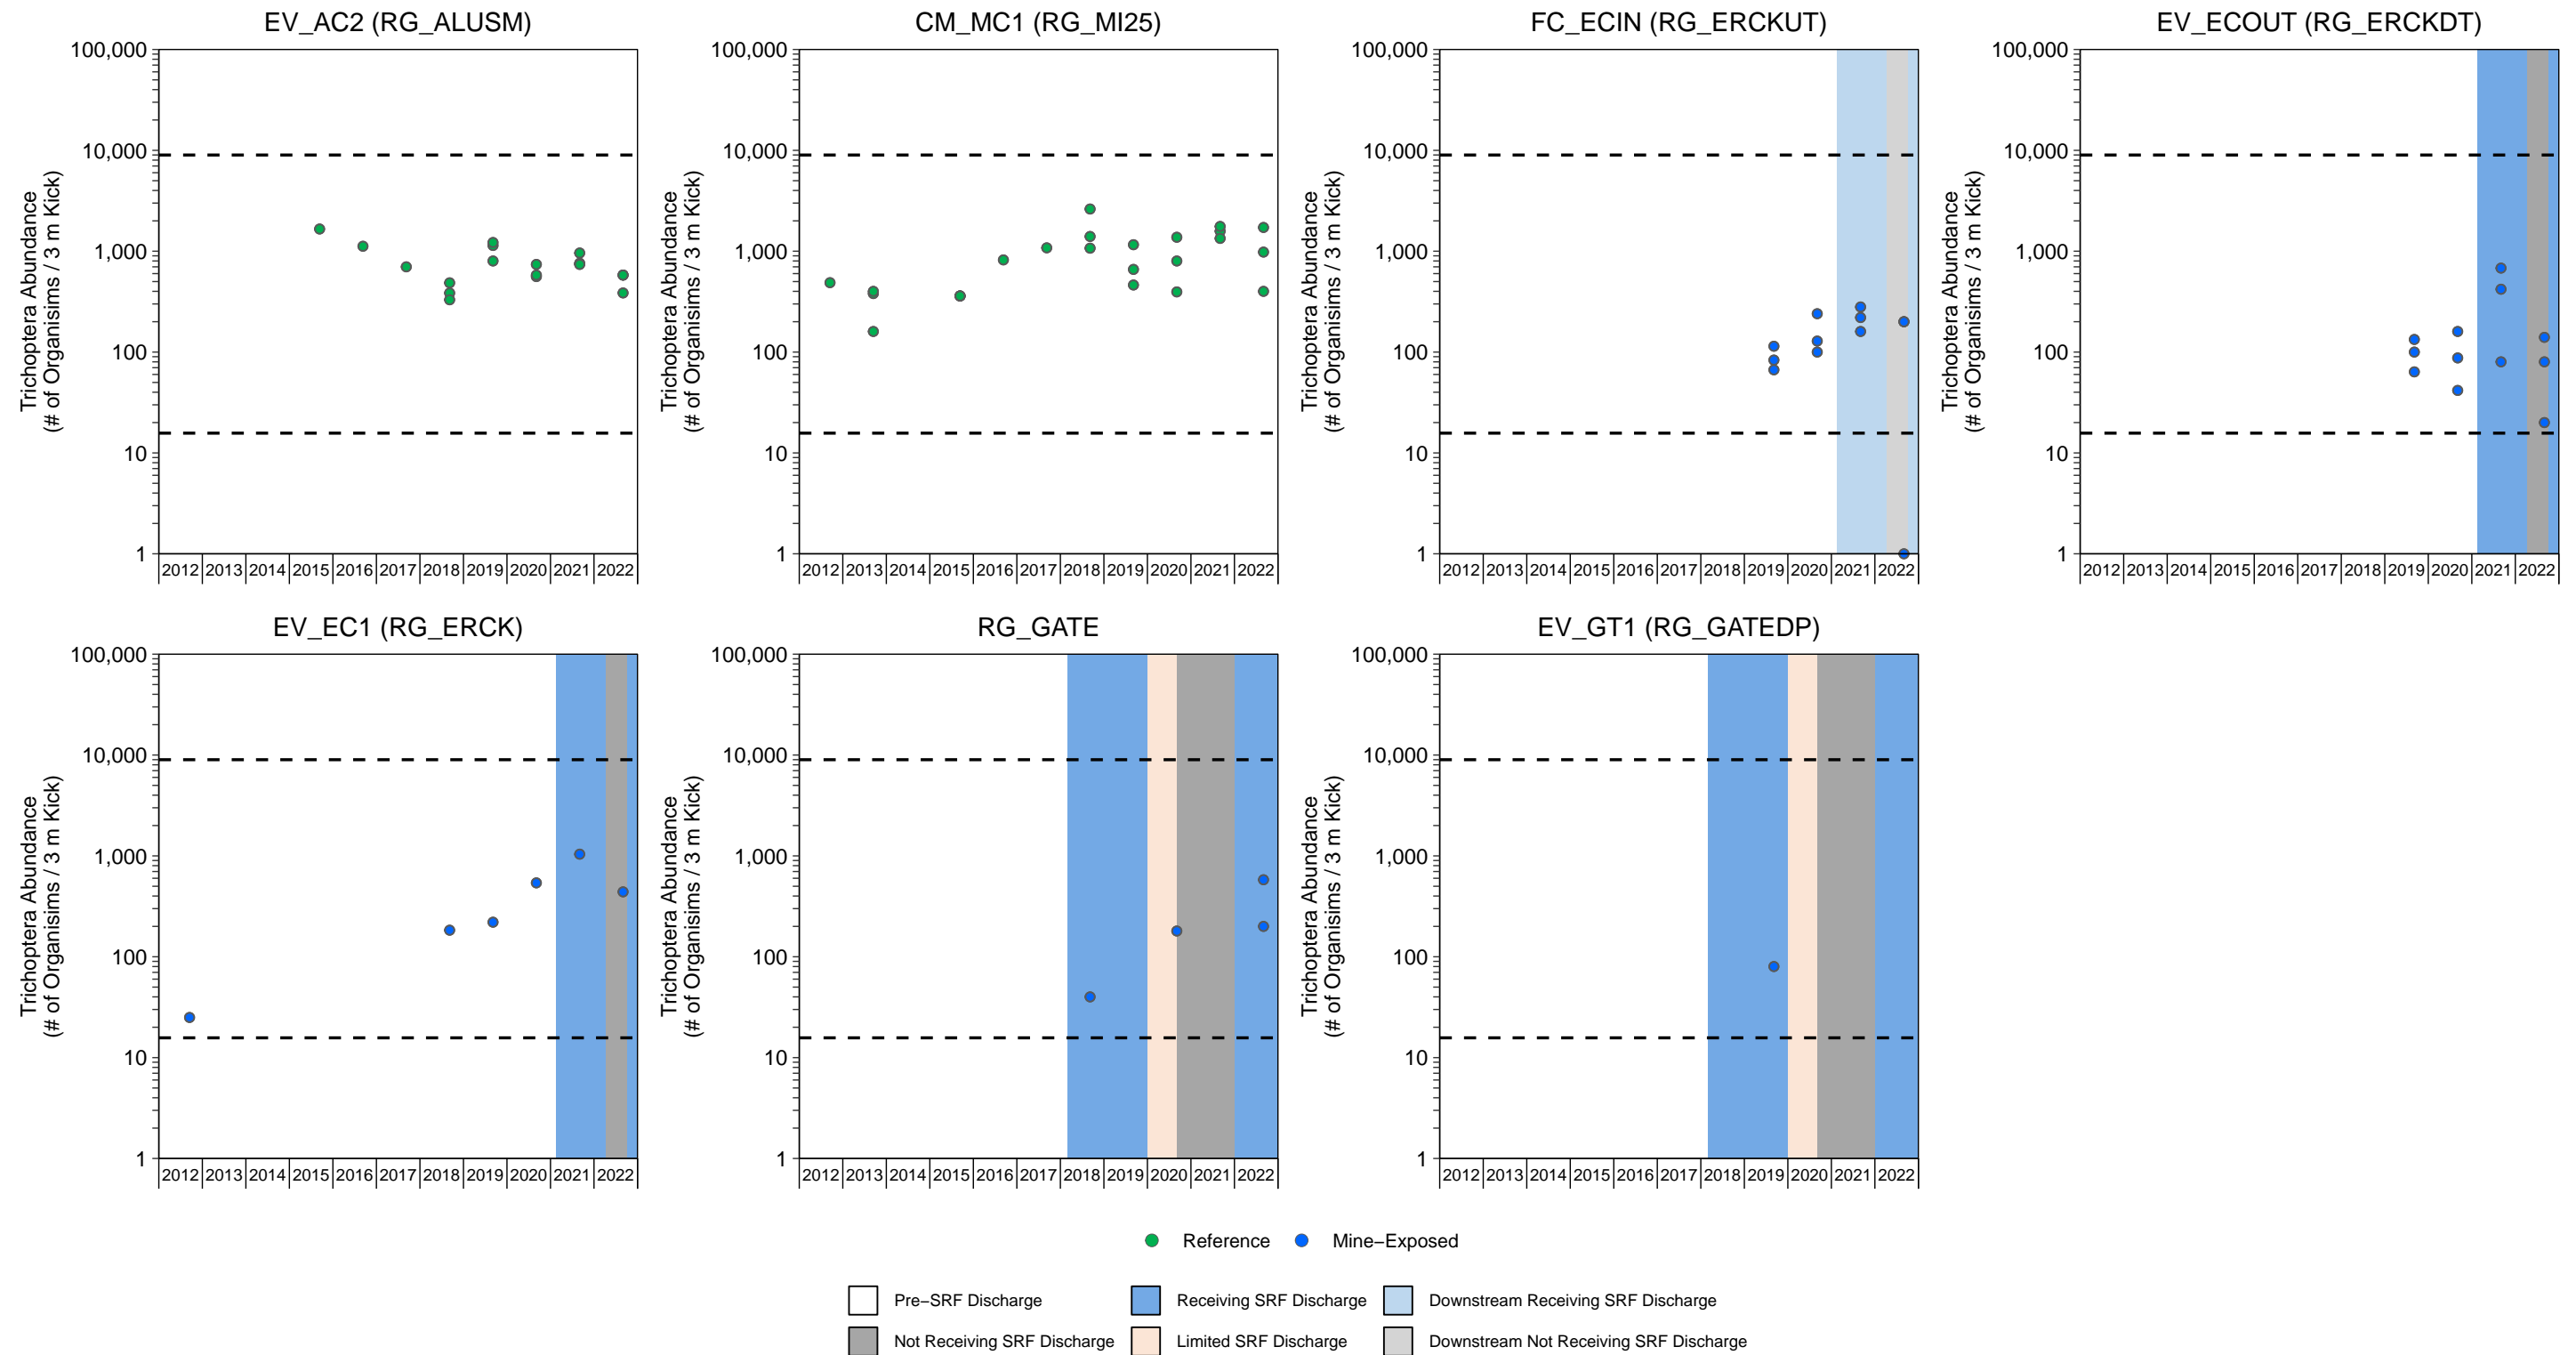

Figure F.11: Benthic Invertebrate Community Endpoints from EVO LAEMP Sampling Areas, September 2012 to 2022

Notes: Site specific normal ranges using regression models shown with grey shading and black rectangle (when available). Normal ranges using percentiles of reference areas from 2012 to 2019 shown as dashed horizontal lines. Values that were close to or equal to 0 were plotted as 1 on the y-axis (on a log₁₀-scale) for abundance

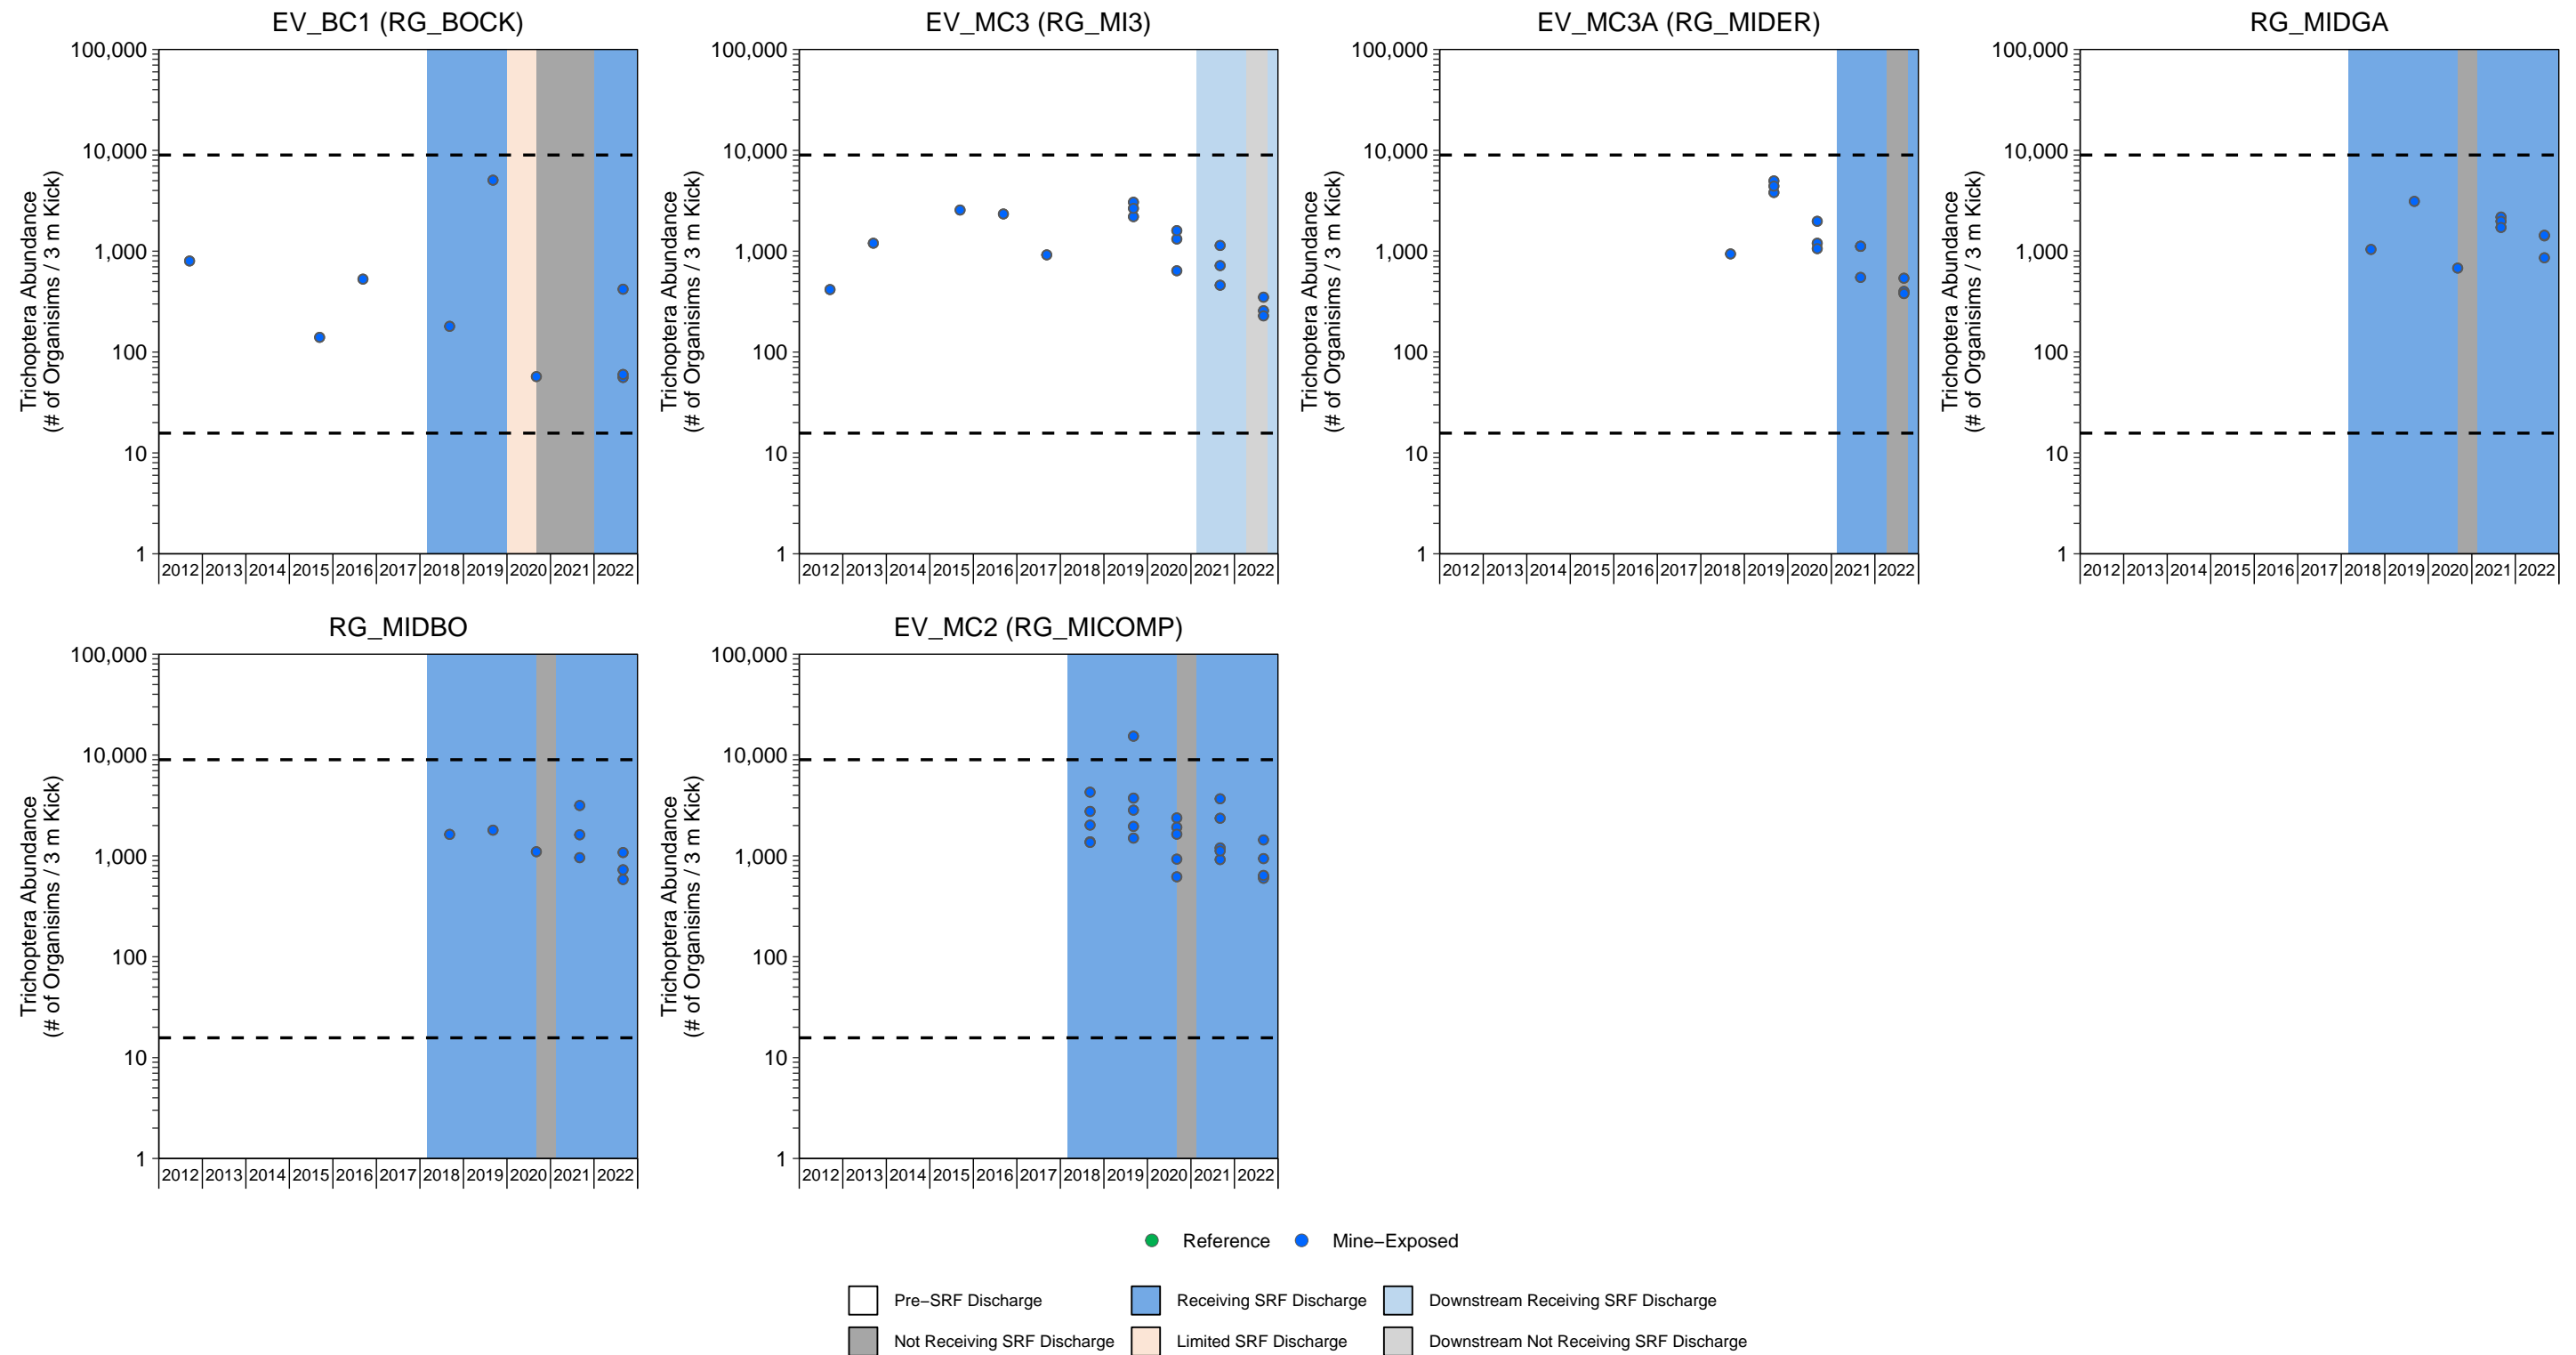

Figure F.11: Benthic Invertebrate Community Endpoints from EVO LAEMP Sampling Areas, September 2012 to 2022

Notes: Site specific normal ranges using regression models shown with grey shading and black rectangle (when available). Normal ranges using percentiles of reference areas from 2012 to 2019 shown as dashed horizontal lines. Values that were close to or equal to 0 were plotted as 1 on the y-axis (on a log₁₀-scale) for abundance

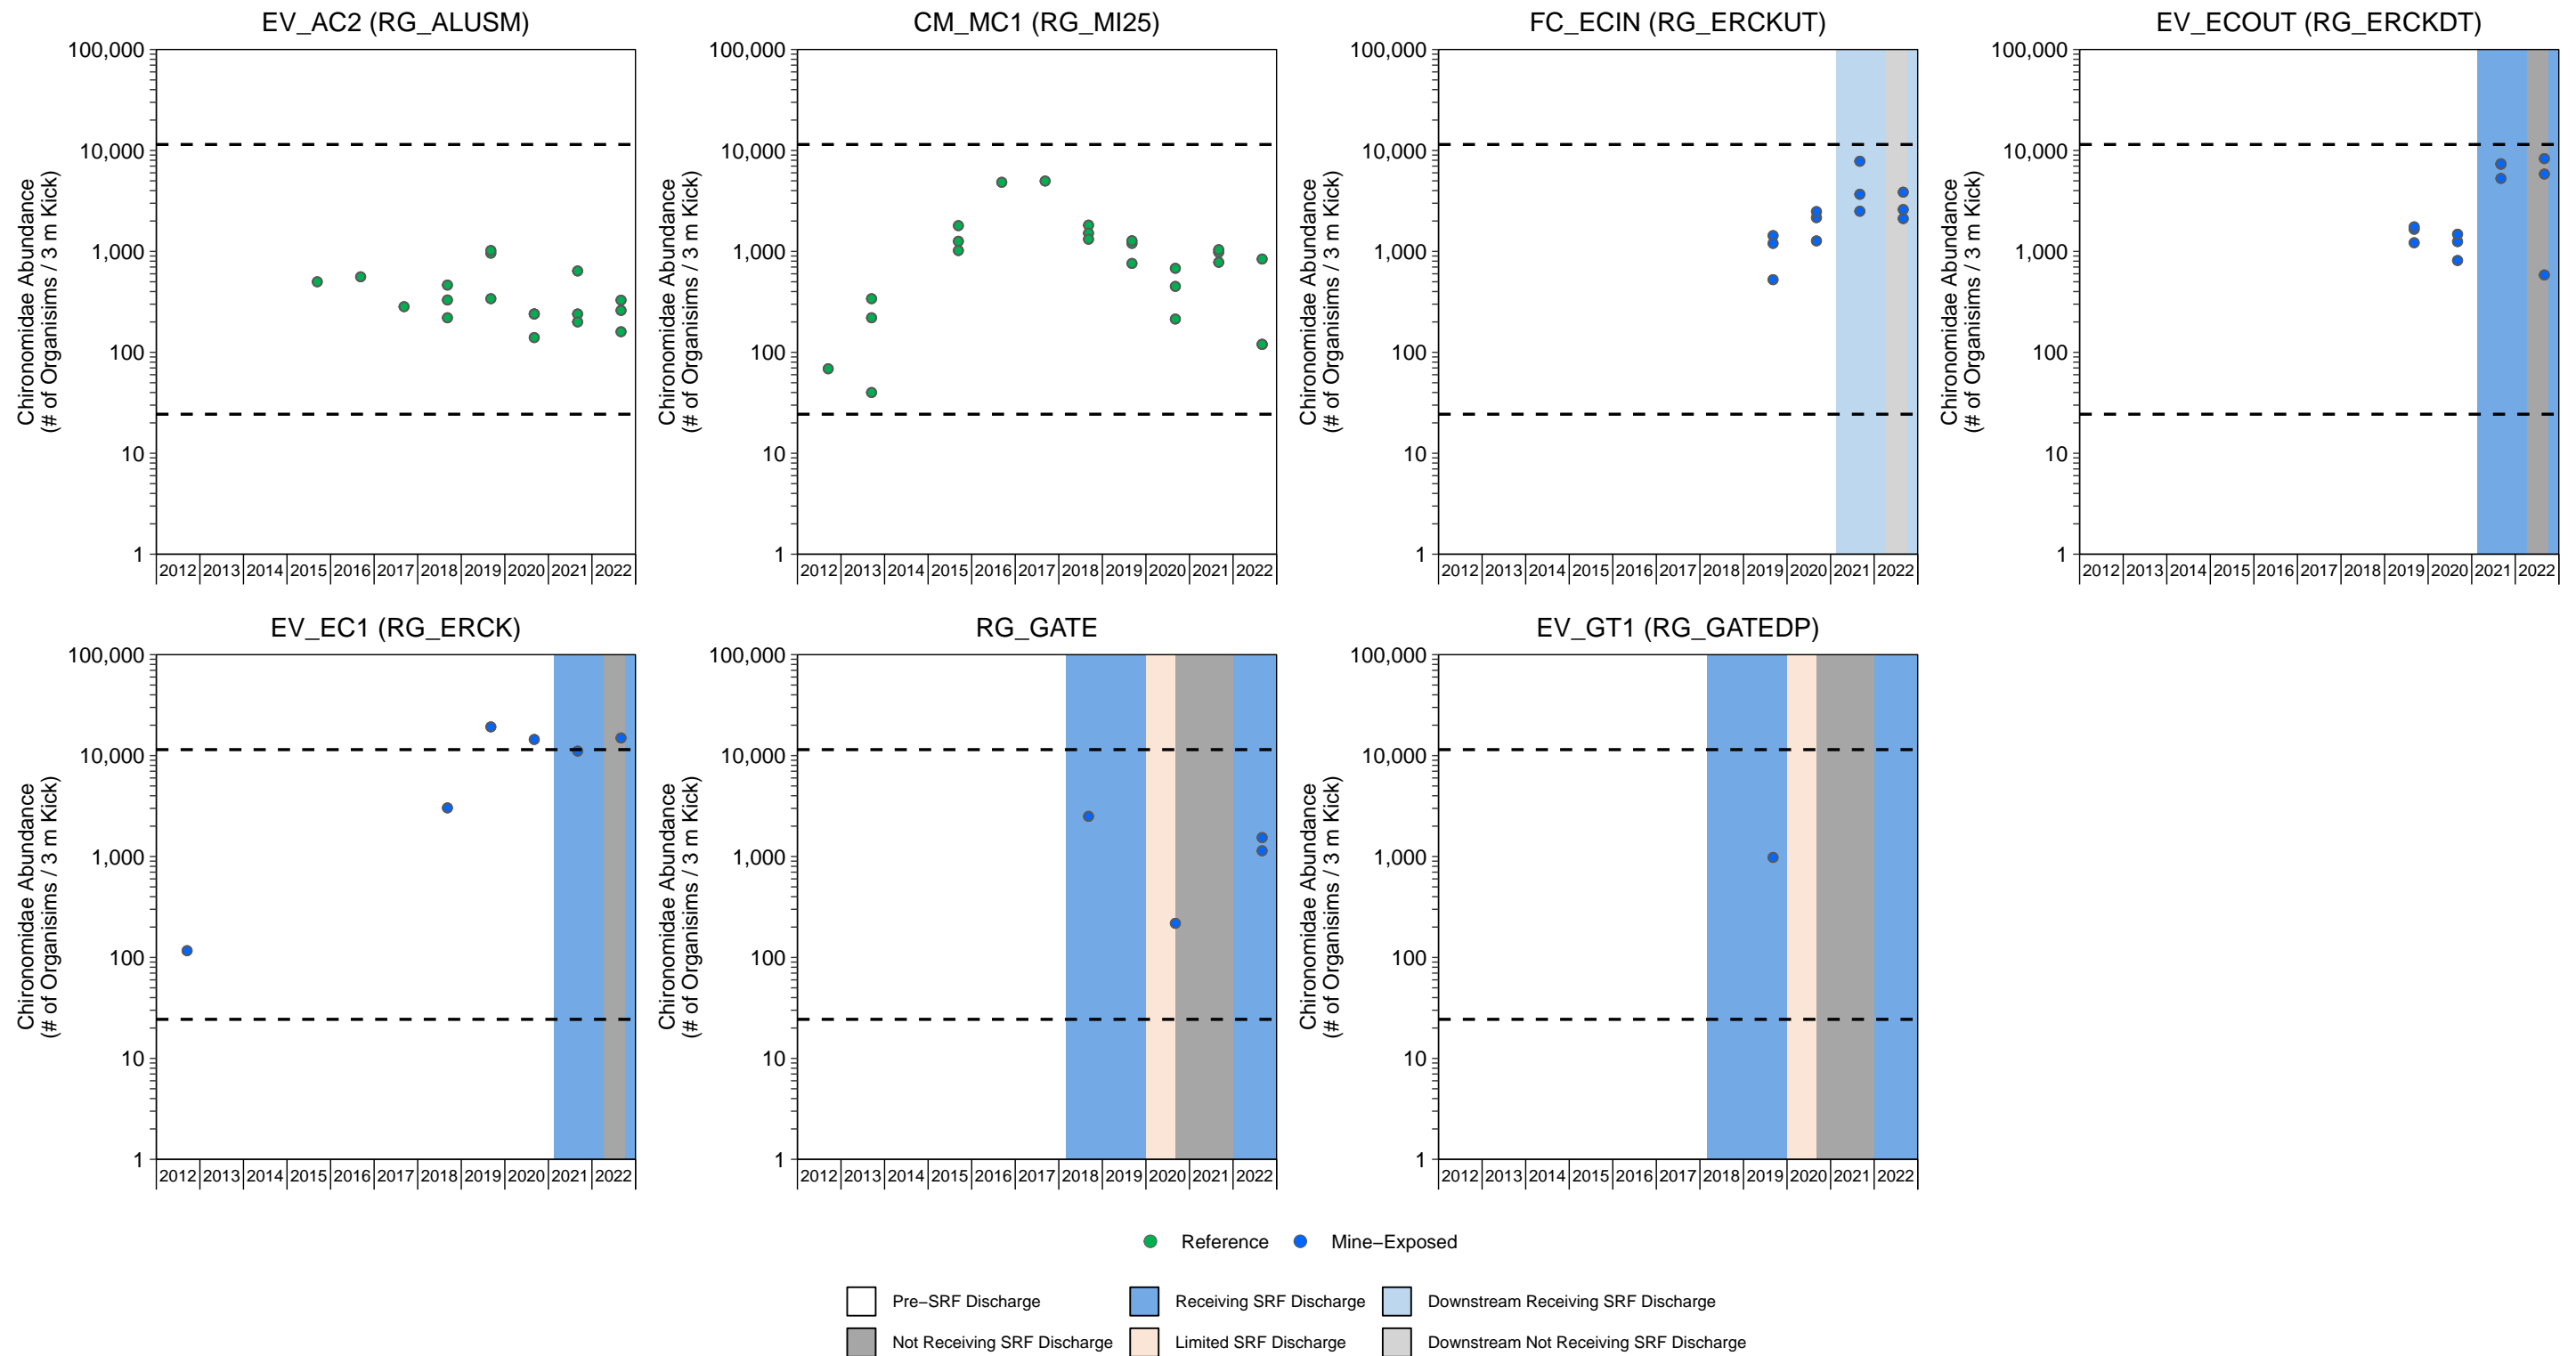

Figure F.12: Benthic Invertebrate Community Endpoints from EVO LAEMP Sampling Areas, September 2012 to 2022

Notes: Site specific normal ranges using regression models shown with grey shading and black rectangle (when available). Normal ranges using percentiles of reference areas from 2012 to 2019 shown as dashed horizontal lines. Values that were close to or equal to 0 were plotted as 1 on the y-axis (on a log₁₀-scale) for abundance

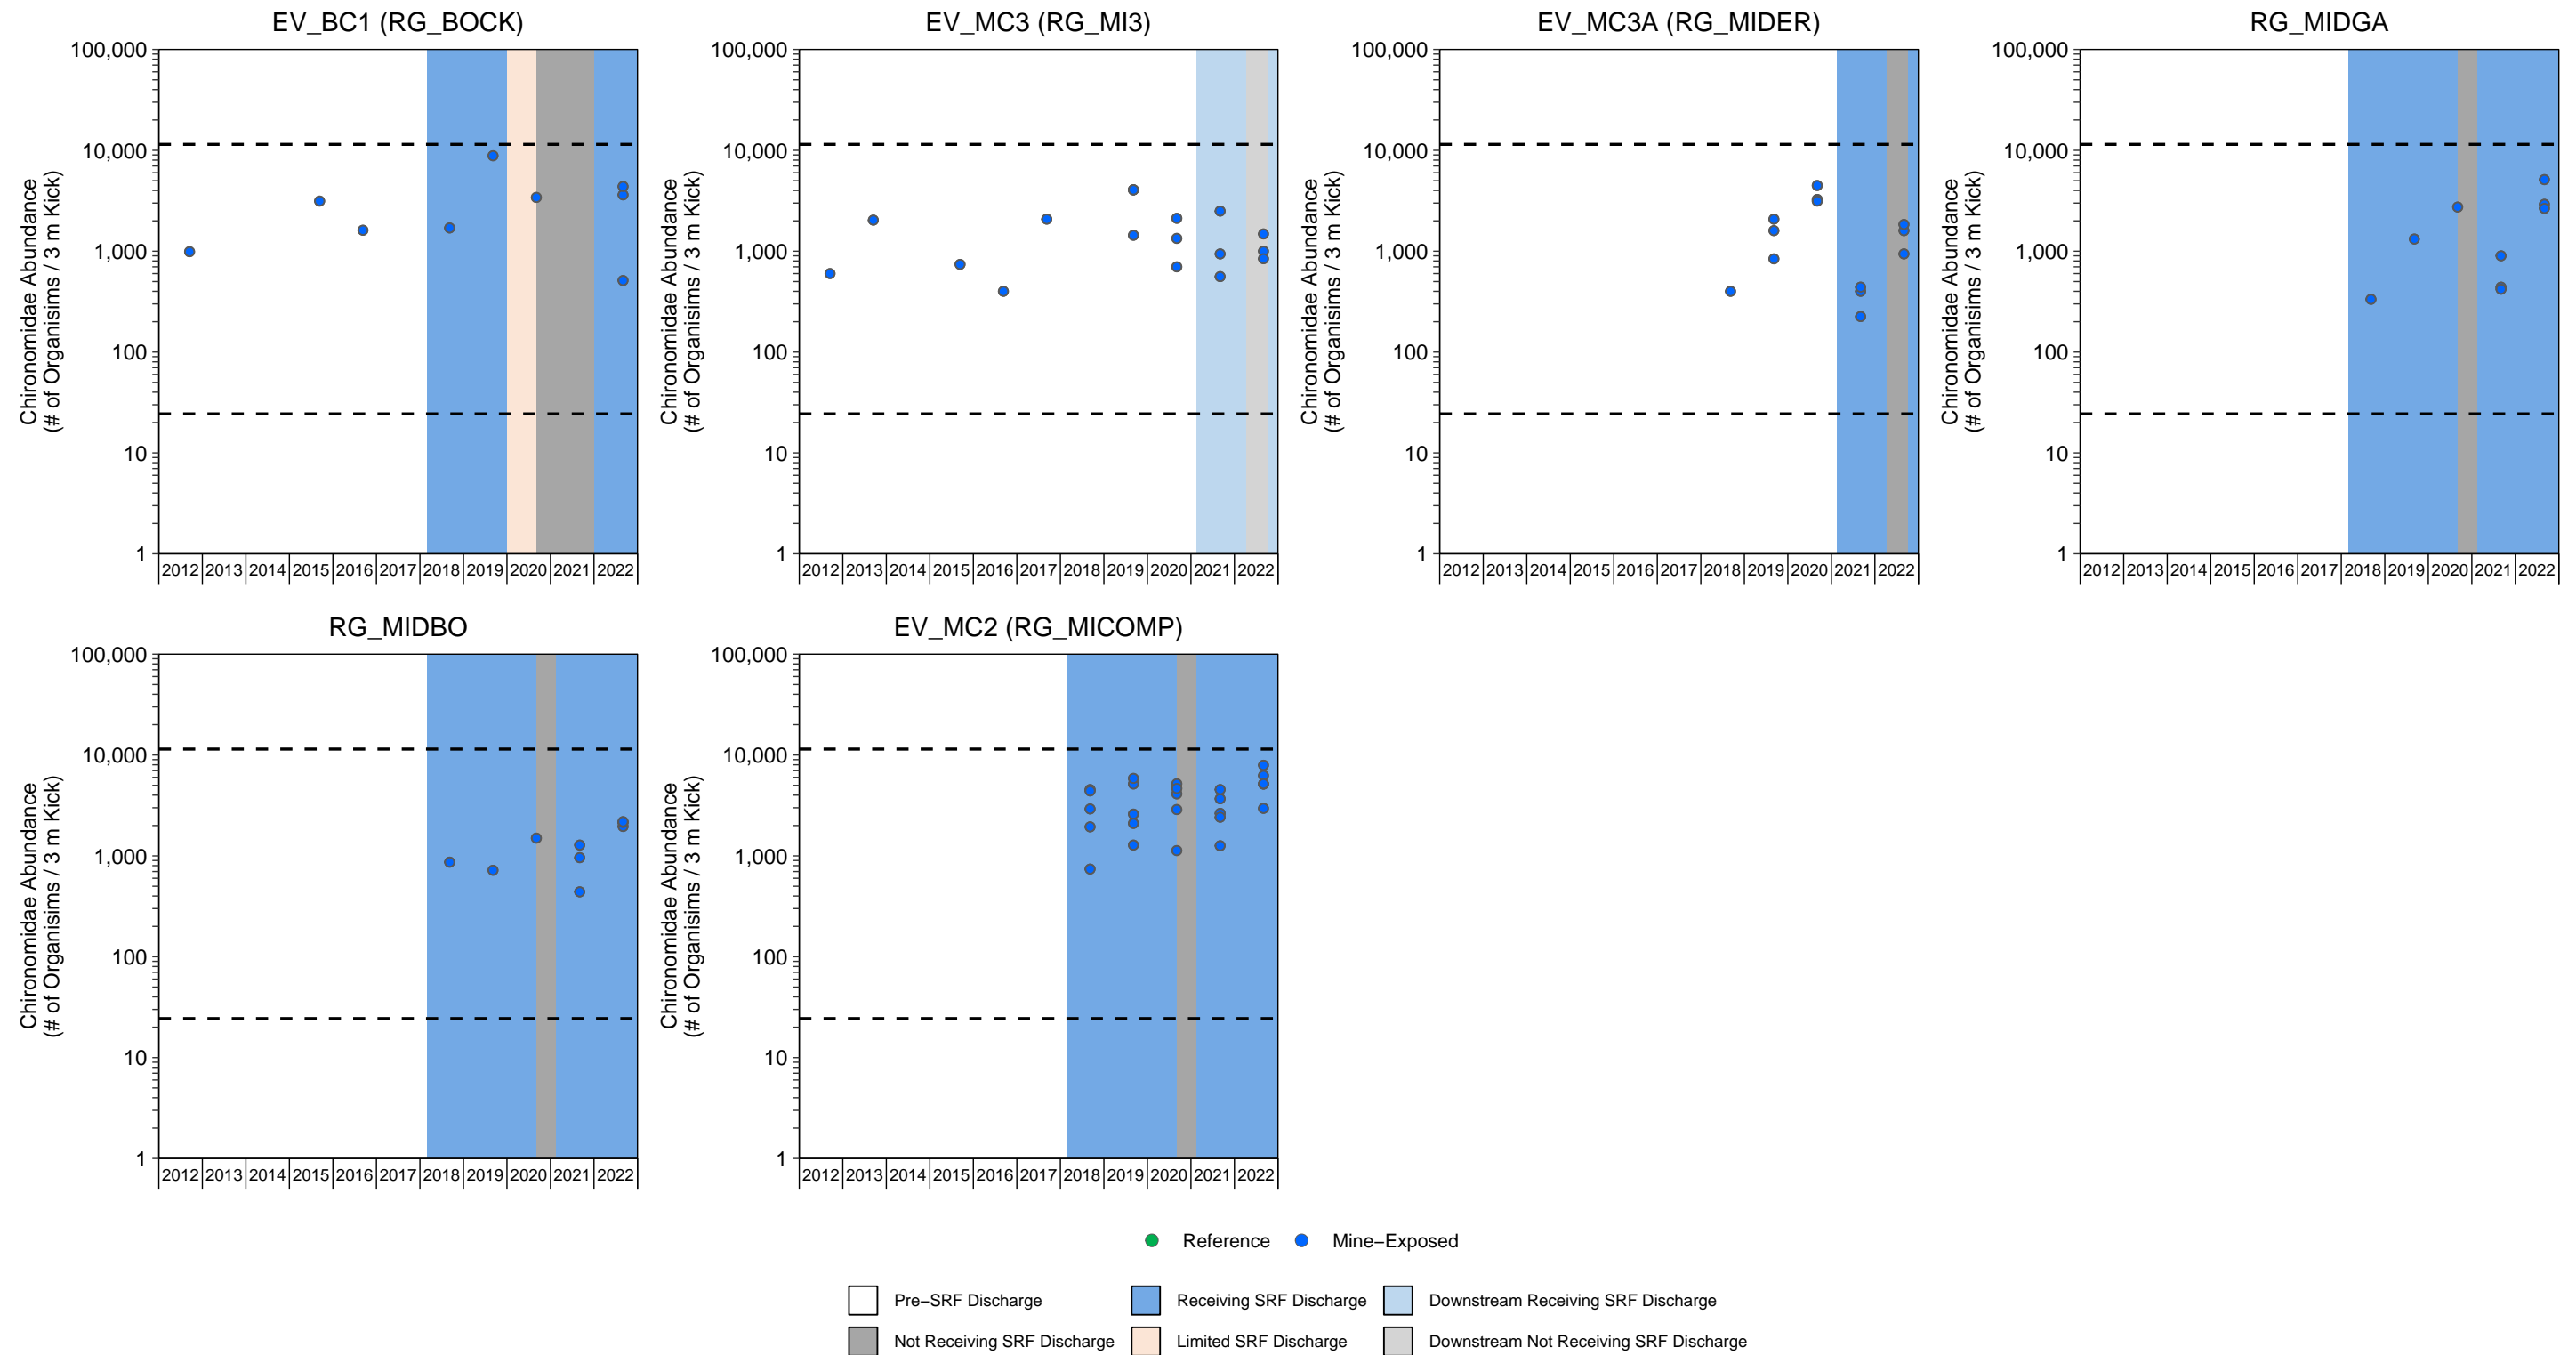

Figure F.12: Benthic Invertebrate Community Endpoints from EVO LAEMP Sampling Areas, September 2012 to 2022

Notes: Site specific normal ranges using regression models shown with grey shading and black rectangle (when available). Normal ranges using percentiles of reference areas from 2012 to 2019 shown as dashed horizontal lines. Values that were close to or equal to 0 were plotted as 1 on the y-axis (on a log₁₀-scale) for abundance

Tissue concentrations in benthic Invertebrates is equal to or exceeds the level 1 benchmark for growth, reproduction, and survival of benthic invertebrates (13 mg/kg dw).
 Tissue concentrations in benthic Invertebrates is equal to or exceeds the level 2 benchmark for growth, reproduction, and survival of benthic invertebrates (20 mg/kg dw).
 Tissue concentrations in benthic Invertebrates is equal to or exceeds the level 3 benchmark for growth, reproduction, and survival of benthic invertebrates (27 mg/kg dw).
 Sample contained annelids, separate annelid only sample available and composite sample without annelids.

Notes: "-" indicates no samples collected; SRF = Saturated Rock Fill; d/s = downstream; Hwy = highway; m = metres

Table F.2: Temporal Changes in Benthic Invertebrate Selenium Tissue Concentration for Reference and Mine-exposed Areas in the EVO LAEMP, September, 2012 to 2022

Status	Area	Year P-value ^a	Q1. Is there a positive or negative change since the base year (b) of monitoring?									Q2. Is the 2022 annual mean greater or less than all annual historical means (2012 to 2021) and the last year (2021)? ^c

- P-value < 0.05 (annual variation).
- > 20% Decrease in concentration.
- > 33% Decrease in concentration.
- > 43% Decrease in concentration.
- > 50% Decrease in concentration.
- > 25% Increase in concentration.
- > 50% Increase in concentration.
- > 75% Increase in concentration.
- > 100% Increase in concentration.

- *Bold Significant increase or decrease from base year (b).
- Significantly less than all historical years (or 2021).
- Significantly greater than all historical years (or 2021).

Notes: "ns" = not significant; "-" insufficient data for comparison.

^a Minimum p-value from post-hoc contrasts with corresponding station

^b Magnitude of Difference (MOD) = $[\text{Mean}_{\text{given year}} - \text{Mean}_{\text{year b}}] / \text{Mean}_{\text{year b}} \times 100\%$.

^c Significance among year determined using all pairwise comparisons using Tukey's honestly significant differences method. Years that share a letter are not significantly different. Letters assigned such that the mean with highest magnitude is assigned "A".

2022		Receiving SRF Discharge	131	<0.001	A	

Post-hoc p-value indicating a significant difference between areas.
 Upstream/mine-exposed area significantly higher than downstream/reference area for that year.
 Upstream/Mine-exposed area significantly lower than downstream/reference area for that year.

^a Planned contrasts comparing the difference between each area in each year from a two-way ANOVA with terms for Area and Year and their interaction. The Magnitude of Difference (MOD) was calculated as (mine-exposed-reference)/reference * 100%.

^b Post-hoc test comparing changes in the relative difference between areas among years. Years that do not share a letter differ in their relative difference between those two years and letters are arranged such that the greatest difference between the areas have the highest letter (i.e., A).

Notes: ns = not significant; SRF = saturated rock fill; MOD = magnitude of difference

Post-hoc p-value indicating a significant difference between areas.
 Upstream/mine-exposed area significantly higher than downstream/reference area for that month.
 Upstream/Mine-exposed area significantly lower than downstream/reference area for that month.

^a Planned contrasts comparing the difference between each area in each month from a two-way ANOVA with terms for Area and Month and their interaction. The Magnitude of Difference (MOD) was calculated as (mine-exposed-reference)/reference * 100%.

^b Post-hoc test comparing changes in the relative difference between areas among years. Months that do not share a letter differ in their relative difference between those two months and letters are arranged such that the greatest difference between the areas have the highest letter (i.e., A).

Notes: "-" indicates insufficient data for comparison; ns = not significant; SRF = saturated rock fill; MOD = magnitude of difference

Upstream/mine-exposed area significantly and ecologically higher than downstream/reference area for that year (<-2SD).

Upstream/Mine-exposed area significantly and ecologically lower than downstream/reference area for that year (>2SD).

^a Planned contrasts comparing the difference between each area in each year from a two-way ANOVA with terms for Area and Year and their interaction. The Magnitude of Difference (MOD) was calculated as (mine-exposed-reference)/estimated standard deviation of the errors from ANOVA model. Calculations conducted on the transformed scale.

^b Post-hoc test comparing changes in the relative difference between areas among years. Years that do not share a letter differ in their relative difference between those two years and letters are arranged such that the greatest difference between the areas have the highest letter (i.e., A).

G1 INTRODUCTION

G1.1 Background

Biological triggers were developed and implemented to assist with identifying and communicating unexpected and potentially important changes in aquatic ecosystem conditions and are required as part of Teck's Adaptive Management Plan (AMP; Teck 2018). Biological triggers were developed in consultation with the EMC for a subset of the biological monitoring endpoints that are effective indicators of changes at the ecosystem level. The purpose of the biological triggers is to quickly identify biological monitoring areas where unexpected biological conditions may be occurring that may require management action. Additionally, information provided from the analysis of biological triggers may lead to responses under the AMP response framework.

Draft biological triggers were developed in the 2018 AMP (Teck 2018) under Management Question 5, with these initially reported on in 2021 in the 2020 LAEMP reports and RAEMP data package, and summarized in the 2020 Annual AMP Report (Teck 2021a). When the 2018 AMP was approved, there was an expectation that the 2018 AMP draft/interim biological triggers would be finalized, through engagement with the EMC, prior to December 15, 2021 AMP Update. The biological triggers were finalized in 2021 (Teck 2021b) and the methods applied in this report reflect the finalized biological triggers (Teck 2021b). It is important to note that the process and/or biological triggers may adjust over time as the purpose of the biological triggers is to be reflective of not only changes in the Elk Valley, but also the current state of knowledge in the area.

The finalized biological triggers (Teck 2021b) include three measurement endpoints:

- Percent EPT (% EPT; Ephemeroptera, Plecoptera, and Trichoptera) – based on travelling kick samples (CABIN protocol), generally three replicates per location per sampling event.
- Benthic invertebrate tissue selenium (BIT Se) – generally several replicates collected per location per sampling event, where each replicate is a composite sample of invertebrates (i.e., composite-taxa sample).
- Westslope cutthroat trout muscle tissue selenium (WCT Se) – generally 8 replicates collected per location per sampling event, where each replicate corresponds to a sample from a single fish.

Evaluation of these three biological trigger endpoints is complementary to the fulsome evaluation of biological endpoints that is integrated into the Local Aquatic Effects

Monitoring Program (LAEMP) and the Regional Aquatic Effects Monitoring Program (RAEMP) data evaluations. The more fulsome evaluation of biological endpoints is used to support answering the specific LAEMP and RAEMP study questions through the consideration of not only the endpoints used in the biological trigger evaluation, but also a full suite of additional biological, chemical, and physical endpoints. Biological triggers do not provide information on cause and effect, report on trends, or feed directly into decision-making processes. Instead, the biological triggers act to flag areas for further evaluation, which would then take place under existing monitoring programs, through the development of supporting studies or through the response framework, as necessary.

Biological monitoring data are compared to triggers annually, and summaries of the LAEMP and RAEMP trigger evaluations and responses are summarized within annual AMP reports.

G2 METHODS

G2.1 Overview

As outlined in Section G1.1, analyses for biological triggers are meant to be complementary to other analyses conducted in the LAEMPs and RAEMP. Biological trigger analyses included two of three trigger endpoints (%EPT and BIT Se [collected under the 2022 EVO LAEMP], as WCT were not sampled as part of the EVO LAEMP.

For the purpose of application of the biological triggers, expectations for the endpoints evaluated (%EPT and BIT Se) were based on projected water quality, not on measured water quality. Thus, the triggers should detect biological results that were unexpected, regardless of whether those results are due to unexpected water quality or due to unexpected relationships between water quality and biological endpoints. Biological triggers were therefore only applied at locations where water quality projections were available. Specifically, five of the mine-exposed areas (RG_ERCK, RG_GATE, RG_BOCK, RG_MI3, and RG_MICOMP) included in the EVO LAEMP were evaluated for benthic invertebrate tissue selenium trigger events and three mine-exposed areas (RG_ERCK, RG_MI3 and RG_MICOMP) were evaluated for the percent EPT biological trigger. Data for other areas studied under the EVO LAEMP were not evaluated relative to biological triggers but were assessed elsewhere as part of the main EVO LAEMP report.

Methodological details are discussed for each of the biological trigger metrics below.

G2.2 Percent EPT

Data for percent EPT were compared to:

- Normal range: The lower limit of habitat-adjusted normal range (2.5th percentile). Up-to-date limits of normal ranges¹ are provided in the RAEMP and LAEMPs, where they are recalculated as needed as new data become available (Teck 2019). The derivation of habitat-adjusted normal ranges is described in Appendix J of the 2020 RAEMP, and was based on consideration of more than 30 habitat, substrate, GIS, and land cover variables (Minnow 2020).
- Expectations: The lower limit of the range of %EPT corresponds to the predicted aquatic data integration tool (ADIT) score. The predicted ADIT scores correspond to potential effects on benthic invertebrate community (BIC) endpoints, based on

¹ The normal range will be updated as part of the three-year reporting cycle of the RAEMP (Minnow 2021b).

relationships between water quality projections (for nitrate, sulphate and cadmium)² and invertebrate toxicity endpoints originally developed for the EVWQP (Teck 2014; Golder 2020a). A predicted ADIT score of 3 corresponds to 50% or greater effects to reproduction of the water flea *Ceriodaphnia dubia*, 2 corresponds to 20 to 50% effects, 1 corresponds to 10 to 20% effects, and 0 corresponds to effect levels of 10% or less. Once %EPT is actually measured, the measured results are converted to a measured ADIT score in relation to the habitat adjusted normal range as follows: An ADIT score of 0 corresponds to expected %EPT \geq the 10th percentile of the habitat-adjusted normal range; an ADIT score of 1 corresponds to expected %EPT between the 10th percentile and the 2.5th percentile of the habitat-adjusted normal range (and is therefore identical in application to the lower limit of normal range); an ADIT score of 2 corresponds to expected %EPT between the 2.5th percentile and half of the 2.5th percentile of the habitat-adjusted normal range; finally, an ADIT score of 3 corresponds to expected %EPT \leq half of the 2.5th percentile and ≥ 0 . Individual replicate habitat-adjusted normal ranges were used at each location for establishing the %EPT limits associated with each ADIT score. In summary, this component of the biological trigger for %EPT asks whether the measured ADIT score – calculated based on measured %EPT relative to normal ranges – is greater than the ADIT score that was predicted based on water quality projections.

Benthic invertebrate community data for %EPT collected in the fall (September) for the 2022 EVO LAEMP were included in the biological trigger analysis.

G2.3 Benthic Invertebrate Tissue Selenium (BIT Se)

Data for BIT Se were compared to:

- **Normal range:** The upper limit of regional normal range (97.5th percentile) for individual replicates. Up-to-date limits of normal ranges³ are provided in the RAEMP and LAEMPs, where they are recalculated as needed as new data become available (Teck 2019).
- **Expectations:** The upper limit of the 95% prediction interval based on the water to BIT bioaccumulation model for lotic environments. The model originally developed in the EVWQP (Golder 2014) was updated (Golder 2020b) and the updated data set was used to calculate prediction intervals for individual replicates. Methodology for estimating the upper limit of the 95% prediction for BIT Se (given any projected value

² Selenium was not included because selenium effects on BIC endpoints are not expected. Projections were based on the highest maximum monthly mean across all flow scenarios (low, average, and high).

³ The normal range will be updated as part of the three-year reporting cycle of the RAEMP (Minnow 2021b).

of aqueous selenium) is discussed further in the Biological Trigger Development for the Elk Valley Adaptive Management Plan (Azimuth 2021 [In Preparation]).

Benthic invertebrate tissue selenium data from sampling events completed throughout 2022 for the EVO LAEMP (April, June, August, September and November [RG_BOCK], March, April, June, July, September, November [RG_ERCK], April, June, July, Aug, September and November [RG_GATE], April, June, July, September and November [RG_MICOMP]), and December [RG_ERCK] were included in the biological trigger analysis although normal range information is based on fall (September) information.

Although effects benchmarks are not part of the trigger, they are relevant for interpreting potential significance and responses. Consequently, the level 1, 2 and 3 benchmarks for the most sensitive receptor (juvenile fish via dietary exposure) are included in plots (11, 18, and 26 mg/kg, respectively).

G3 RESULTS

G3.1 Percent EPT

Individual replicates for the %EPT endpoint for each of the three mine-exposed areas (RG_ERCK, RG_MI3, and RG_MICOMP) were each assessed against their respective biological triggers for the September sampling period (Appendix Table G.1 and Appendix Figure G.1). The mine-exposed area, RG_ERCK, had a % EPT of 9.86%, which was lower than the biological trigger value of 67.2%. However, only one replicate was measured at this location. RG_ERCK is located just upstream of the confluence of Erickson Creek and Michel Creek and downstream from the saturated rock fille (SRF). Another mine-exposed area RG_MICOMP, which is downstream of the confluences of Erickson, Gate, and Bodie Creeks with Michel Creek, also had %EPT values in five replicates (43.0%, 36.9%, 40.1%, 42.0%, and 48.1%) lower than the biological triggers (55.2%, 58.6%, 54.6%, 57.6%, and 57.9%, respectively). The third mine-exposed areas in Michel Creek, RG_MI3 (which is above the confluence of Erickson and Michel Creek) had results above their biological trigger value in all replicates and the lower 2.5th percentile of habitat-adjusted normal range.

G3.2 Benthic Invertebrate Tissue Selenium (BIT Se)

Benthic invertebrate tissue selenium concentrations for each mine-exposed area was assessed against their respective biological trigger for individual replicate samples from each of the three sampling events in 2022 (March, April, June, July, August, September, and November; Appendix Table G.2 and Appendix Figure G.2). At RG_GATE, benthic invertebrate tissue selenium concentrations for all April, June, and July, and one replicate in August, two in September, and three in November exceeded the biological trigger value, ranging from 21 to 49 mg/kg. These values were higher than both the upper 95% prediction limit of 15.2 mg/kg (as based on predicted water quality) and the upper 97.5th percentile of normal range, which was 8.7 mg/kg. At RG_BOCK, all replicates had benthic invertebrate tissue selenium concentrations which exceeded the biological trigger values in April (reported concentrations of 17 to 22 mg/kg), June (reported concentrations of 53 to 83 mg/kg), and September (reported concentrations of 27 to 59 mg/kg), and November (reported concentrations of 31 and 35 mg/kg). In August, all but one replicate exceeded the biological trigger (reported concentrations of 28 and 35 mg/kg). Benthic invertebrate tissue selenium concentrations, however, did not exceed the biological trigger value at RG_ERCK (the confluence of Erickson Creek and Michel Creek) in any sampling event (March, April, June, July, September or November), as concentrations of benthic invertebrate tissue selenium ranged from 3.4 to 8.2 mg/kg in 2022. Benthic invertebrate tissue selenium concentrations in Michel Creek,

specifically RG_MICOMP (3.7 to 11 mg/kg), were all below their respective biological trigger value.

G4 SUMMARY

A single replicate from RG_ERCK was lower than the %EPT biological trigger and at RG_MICOMP, which is downstream of the confluences of Erickson, Gate, and Bodie Creeks with Michel Creek, all replicates were lower than the biological triggers. The %EPT results for these mine-exposed areas was consistent with results classified as 'unexpected' in the most recent RAEMP (Minnow 2020). Additionally, the biological trigger for benthic invertebrate tissue selenium concentrations was exceeded in most replicates from both RG_BOCK and RG_GATE (during the all sampling events). The BIT selenium concentration at RG_ERCK in Erickson Creek and the area evaluated in Michel Creek (RG_MICOMP), were below the biological trigger threshold in all samples.

The results from the biological triggers evaluation are consistent with the findings of the EVO LAEMP. Current biological triggers were sufficient to identify monitoring areas where biological responses are occurring, based on the integrated assessment conducted in the LAEMP, and no additional triggers are recommended at this time. In an effort to resolve uncertainty around the combined and individual effects of water quality, habitat, and other mine-related stressors on benthic invertebrate communities in lotic areas in the Elk River watershed, Minnow is developing a predictive model for benthic invertebrate community endpoints. Uncertainties are expected to be reduced through these efforts, and additional monitoring or potential management responses will continue to be assessed through Teck's adaptive management framework.

Figure G.1: % EPT Compared to Predicted Values, EVO LAEMP, 2022

Notes: Black bars indicate the lower limit of the predicted ADIT score for the location. Blue dots represent values exceeding the trigger (below 2.5th percentile of NR and below lower limit of predicted ADIT score). Gray shading represents the habitat-adjusted normal range for each replicate. T = Tributary, M = Mainstem.

Figure G.2: Selenium Concentrations in Benthic Invertebrate Composite-Taxa Samples Compared to Predicted Values, EVO LAEMP, 2022

Notes: Black bars indicate the upper 95th prediction interval of the bioaccumulation model. Blue dots represent values exceeding the trigger (above the 97.5th percentile of normal range and above upper 95% prediction interval). Dotted lines indicate EVWQP benchmarks (11, 18, and 26 mg/kg respectively) for juvenile fish. Gray shading represents the reference area normal range defined as the 2.5th and 97.5th percentiles of the distribution of reference area data (pooled 1996 to 2019 data) reported in the RAEMP.

Table G.1: Biological Trigger Analysis for %EPT in EVO LAEMP, September 2022

Exposure	Area	Type	rep	Reported Value	ADIT Value ^a	Lower 2.5th Percentile of the Habitat Adjusted Normal Range
Mine-exposed	RG_ERCK	T	1	9.86	67.2	67.2
	RG_MI3	M	1	65.8	64.3	58.8
	RG_MI3	M	2	71.7	60.7	54.3
	RG_MI3	M	3	71.8	59.9	53.6
	RG_MICOMP	M	1	43.0	62.3	55.2
	RG_MICOMP	M	2	36.9	64.5	58.6
	RG_MICOMP	M	3	40.1	61.2	54.6
	RG_MICOMP	M	4	42.0	63.6	57.6
	RG_MICOMP	M	5	48.1	65.1	57.9

Shaded cells signify those individual replicates that were associated with a biological trigger (i.e. lower than both the ADIT value [as based on predicted water quality] and the lower 2.5th percentile of habitat-adjusted normal range).

Notes: M= Mainstem and T = Tributary.

^a Information pertaining to the calculation of the ADIT value is shown in Section E3.1.

Table G.2: Biological Trigger Analysis for Selenium Concentrations in Benthic Invertebrate Tissue, EVO LAEMP, 2022

Shaded cells signify those individual replicates that were associated with a biological trigger (i.e. higher than both the upper 95% prediction limit [as based on predicted water quality] and the upper 97.5th percentile of normal range).

Notes: M= Mainstem and T = Tributary.

Table G.2: Biological Trigger Analysis for Selenium Concentrations in Benthic Invertebrate Tissue, EVO LAEMP, 2022

Waterbody	Stream Type	Area	Date	Predicted Selenium Water Concentration (mg/L)	Benthic Invertebrate Selenium Tissue			
					Upper 95% Prediction Limit (mg/kg dw)	Upper 97.5th Percentile of Normal Range (mg/kg dw)	Reported Concentration (mg/kg dw)

WATER CHEMISTRY

ALS Laboratory Reports

CERTIFICATE OF ANALYSIS

Work Order : CG2202405
Client : Teck Coal Limited
Contact : Allie Ferguson
Address : Eagle 4 Facility 421 Pine Avenue
Sparwood BC Canada V0B 2G0
Telephone : ---
Project : F2 SRF FST
PO : VPO00816101
C-O-C number : March EVO LAEMP 2022
Sampler : Alex McClymont/ Minnow
Site : ---
Quote number : Teck Coal Master Quote
No. of samples received : 1
No. of samples analysed : 1

Page : 1 of 6
Laboratory : Calgary - Environmental
Account Manager : Lyudmyla Shvets
Address : 2559 29th Street NE
Calgary AB Canada T1Y 7B5
Telephone : +1 403 407 1800
Date Samples Received : 03-Mar-2022 09:05
Date Analysis Commenced : 03-Mar-2022
Issue Date : 15-Mar-2022 15:25

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Table with 3 columns: Signatories, Position, Laboratory Department. Lists names like Angela Ren, Caleb Deroche, Dan Gebert, Erin Sanchez, Harpreet Chawla, Kim Jensen, Lindsay Gung, Oscar Ruiz, Owen Cheng, Ruifang Zheng, Sara Niroomand and their respective roles and departments.

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

<i>Unit</i>	<i>Description</i>
-	No Unit
%	percent
µg/L	micrograms per litre
µS/cm	Microsiemens per centimetre
meq/L	milliequivalents per litre
mg/L	milligrams per litre
mV	millivolts
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Qualifiers

<i>Qualifier</i>	<i>Description</i>
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).

QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: CG2202405	Page	: 1 of 13
Client	: Teck Coal Limited	Laboratory	: Calgary - Environmental
Contact	: Allie Ferguson	Account Manager	: Lyudmyla Shvets
Address	: Eagle 4 Facility 421 Pine Avenue Sparwood BC Canada V0B 2G0	Address	: 2559 29th Street NE Calgary, Alberta Canada T1Y 7B5
Telephone	: ----	Telephone	: +1 403 407 1800
Project	: F2 SRF FST	Date Samples Received	: 03-Mar-2022 09:05
PO	: VPO00816101	Issue Date	: 15-Mar-2022 15:25
C-O-C number	: March EVO LAEMP 2022		
Sampler	: Alex McClymont/ Minnow		
Site	: ----		
Quote number	: Teck Coal Master Quote		
No. of samples received	: 1		
No. of samples analysed	: 1		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.

CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.

DQO: Data Quality Objective.

LOR: Limit of Reporting (detection limit).

RPD: Relative Percent Difference.

Workorder Comments

Holding times are displayed as "----" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Matrix: **Water** Evaluation: * = Holding time exceedance ; ✓ = Within Holding Time

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water** Evaluation: * = QC frequency outside specification; ✓ = QC frequency within specification.

Quality Control Sample Type	Method	QC Lot #	Count		Frequency (%)		Evaluation
			QC	Regular	Actual	Expected	
Analytical Methods							
Laboratory Duplicates (DUP)							
Acidity by Titration	E283	422842	1	19	5.2	5.0	✓

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 Calgary - Environmental	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 Calgary - Environmental	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
Turbidity by Nephelometry	E121 Calgary - Environmental	Water	APHA 2130 B (mod)	Turbidity is measured by the nephelometric method, by measuring the intensity of light scatter under defined conditions.
ORP by Electrode	E125 Calgary - Environmental	Water	ASTM D1498 (mod)	Oxidation reduction potential is reported as the oxidation-reduction potential of the platinum metal-reference electrode employed, measured in mV. For high accuracy test results, it is recommended that this analysis be conducted in the field.
TSS by Gravimetry (Low Level)	E160-L Calgary - Environmental	Water	APHA 2540 D (mod)	Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, following by drying of the filter at 104 ± 1°C, with gravimetric measurement of the filtered solids. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.
TDS by Gravimetry	E162 Calgary - Environmental	Water	APHA 2540 C (mod)	Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, with evaporation of the filtrate at 180 ± 2°C for 16 hours or to constant weight, with gravimetric measurement of the residue.
Bromide in Water by IC (Low Level)	E235.Br-L Calgary - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Chloride in Water by IC (Low Level)	E235.Cl-L Calgary - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Fluoride in Water by IC	E235.F Calgary - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC (Low Level)	E235.NO2-L Calgary - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC (Low Level)	E235.NO3-L Calgary - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Sulfate in Water by IC	E235.SO4 Calgary - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Acidity by Titration	E283 Calgary - Environmental	Water	APHA 2310 B (mod)	Acidity is determined by potentiometric titration to pH endpoint of 8.3

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Alkalinity Species by Titration	E290 Calgary - Environmental	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 Calgary - Environmental	Water	J. Environ. Monit., 2005, 7, 37-42 (mod)	Ammonia in water is analyzed by flow-injection analysis with fluorescence detection after reaction with orthophthaldialdehyde (OPA).
Total Kjeldahl Nitrogen by Fluorescence (Low Level)	E318 Vancouver - Environmental	Water	APHA 4500-Norg D (mod)	Total Kjeldahl Nitrogen is determined using block digestion followed by flow-injection analysis with fluorescence detection.
Total Organic Carbon (Non-Purgeable) by Combustion (Low Level)	E355-L Calgary - Environmental	Water	APHA 5310 B (mod)	Total Organic Carbon (Non-Purgeable), also known as NPOC (total), is a direct measurement of TOC after an acidified sample has been purged to remove inorganic carbon (IC). Analysis is by high temperature combustion with infrared detection of CO ₂ . NPOC does not include volatile organic species that are purged off with IC. For samples where the majority of total carbon (TC) is comprised of IC (which is common), this method is more accurate and more reliable than the TOC by subtraction method (i.e. TC minus TIC).
Dissolved Organic Carbon by Combustion (Low Level)	E358-L Calgary - Environmental	Water	APHA 5310 B (mod)	Dissolved Organic Carbon (Non-Purgeable), also known as NPOC (dissolved), is a direct measurement of DOC after a filtered (0.45 micron) sample has been acidified and purged to remove inorganic carbon (IC). Analysis is by high temperature combustion with infrared detection of CO ₂ . NPOC does not include volatile organic species that are purged off with IC. For samples where the majority of DC (dissolved carbon) is comprised of IC (which is common), this method is more accurate and more reliable than the DOC by subtraction method (i.e. DC minus DIC).
Total Phosphorus by Colourimetry (Ultra Trace)	E372-U Calgary - Environmental	Water	APHA 4500-P E (mod).	Total Phosphorus is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Dissolved Orthophosphate by Colourimetry (Ultra Trace Level)	E378-U Calgary - Environmental	Water	APHA 4500-P F (mod)	Dissolved Orthophosphate is determined colourimetrically on a sample that has been lab or field filtered through a 0.45 micron membrane filter. Field filtration is recommended to ensure test results represent conditions at time of sampling.
Total Metals in Water by CRC ICPMS	E420 Vancouver - Environmental	Water	EPA 200.2/6020B (mod)	Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Total Chromium in Water by CRC ICPMS (Low Level)	E420.Cr-L Vancouver - Environmental	Water	EPA 200.2/6020B (mod)	Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS.
Dissolved Metals in Water by CRC ICPMS	E421 Vancouver - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Chromium in Water by CRC ICPMS (Low Level)	E421.Cr-L Vancouver - Environmental	Water	APHA 3030 B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS
Total Mercury in Water by CVAFS (Low Level, LOR = 0.5 ppt)	E508-L Vancouver - Environmental	Water	EPA 1631E (mod)	Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAFS.
Dissolved Mercury in Water by CVAAS	E509 Vancouver - Environmental	Water	APHA 3030B/EPA 1631E (mod)	Water samples are filtered (0.45 um), preserved with HCl, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.
Dissolved Hardness (Calculated)	EC100 Vancouver - Environmental	Water	APHA 2340B	"Hardness (as CaCO ₃), dissolved" is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO ₃ equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Ion Balance using Dissolved Metals	EC101 Calgary - Environmental	Water	APHA 1030E	Cation Sum, Anion Sum, and Ion Balance are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Dissolved species are used where available. Minor ions are included where data is present. Ion Balance cannot be calculated accurately for waters with very low electrical conductivity (EC).

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Ammonia	EP298 Calgary - Environmental	Water		Sample preparation for Preserved Nutrients Water Quality Analysis.
Digestion for TKN in water	EP318 Vancouver - Environmental	Water	APHA 4500-Norg D (mod)	Samples are digested using block digestion with Copper Sulfate Digestion Reagent.
Preparation for Total Organic Carbon by Combustion	EP355 Calgary - Environmental	Water		Preparation for Total Organic Carbon by Combustion
Preparation for Dissolved Organic Carbon for Combustion	EP358 Calgary - Environmental	Water	APHA 5310 B (mod)	Preparation for Dissolved Organic Carbon
Digestion for Total Phosphorus in water	EP372 Calgary - Environmental	Water	APHA 4500-P E (mod).	Samples are heated with a persulfate digestion reagent.
Dissolved Metals Water Filtration	EP421 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO ₃ .

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.

CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.

DQO = Data Quality Objective.

LOR = Limit of Reporting (detection limit).

RPD = Relative Percentage Difference

= Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

Issue Date : 18-Mar-2022 11:33

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

<i>Signatories</i>	<i>Position</i>	<i>Laboratory Department</i>
Angela Ren	Team Leader - Metals	Metals, Burnaby, British Columbia
Caleb Deroche	Lab Analyst	Metals, Burnaby, British Columbia
Erin Sanchez		Inorganics, Calgary, Alberta
Harpreet Chawla	Team Leader - Inorganics	Inorganics, Calgary, Alberta
Kevin Duarte	Supervisor - Metals ICP Instrumentation	Metals, Burnaby, British Columbia
Kinny Wu	Lab Analyst	Metals, Burnaby, British Columbia
Lindsay Gung	Supervisor - Water Chemistry	Inorganics, Burnaby, British Columbia

Sara Niroomand		Inorganics, Calgary, Alberta

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
 LOR: Limit of Reporting (detection limit).

Unit	Description
-	No Unit
%	percent
µg/L	micrograms per litre
µS/cm	Microsiemens per centimetre
meq/L	milliequivalents per litre
mg/L	milligrams per litre
mV	millivolts
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Sample Comments

Sample	Client Id	Comment
CG2202406-003	RG_TRIP_WS_LAEMP_EVO_2 022-03_NP	Sample 3 (Trip blank): dissolved metals, mercury samples not received. Analyses cancelled.

Qualifiers

Qualifier	Description
DLDS	Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).
DTC	Dissolved concentration exceeds total. Results were confirmed by re-analysis.

RRV *Reported result verified by repeat analysis.*
TKNI *TKN result may be biased low due to Nitrate interference. Nitrate-N is > 10x TKN.*

QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: CG2202406	Page	: 1 of 33
Client	: Teck Coal Limited	Laboratory	: Calgary - Environmental
Contact	: Mike Pope	Account Manager	: Lyudmyla Shvets
Address	: RR#1 HWY#3 Sparwood BC Canada V0B 2G1	Address	: 2559 29th Street NE Calgary, Alberta Canada T1Y 7B5
Telephone	: ----	Telephone	: +1 403 407 1800
Project	: REGIONAL EFFECTS PROGRAM	Date Samples Received	: 03-Mar-2022 09:05
PO	: VPO00816101	Issue Date	: 18-Mar-2022 11:34
C-O-C number	: March EVO LAEMP 2022		
Sampler	: AMC		
Site	: ----		
Quote number	: Teck Coal Master Quote		
No. of samples received	: 8		
No. of samples analysed	: 8		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

- Anonymous:** Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Workorder Comments

Holding times are displayed as "----" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

Page : 26 of 33
Work Order : CG2202406
Client : Teck Coal Limited
Project : REGIONAL EFFECTS PROGRAM

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water** Evaluation: * = QC frequency outside specification; ✓ = QC frequency within specification.

Quality Control Sample Type	Method	QC Lot #	Count		Frequency (%)		Evaluation
			QC	Regular	Actual	Expected	
Analytical Methods							
Laboratory Duplicates (DUP)							
Acidity by Titration	E283	423829	1	20	5.0	5.0	✓
Alkalinity Species by Titration	E290	423056	2	40	5.0	5.0	✓
Ammonia by Fluorescence	E298	423933	2	26	7.6	5.0	✓
Bromide in Water by IC (Low Level)	E235.Br-L	423043	1	20	5.0	5.0	✓
Chloride in Water by IC (Low Level)	E235.Cl-L	423044	1	20	5.0	5.0	✓
Conductivity in Water	E100	423054	2	40	5.0	5.0	✓
Dissolved Chromium in Water by CRC ICPMS (Low Level)	E421.Cr-L	426307	1	16	6.2	5.0	✓
Dissolved Mercury in Water by CVAAS	E509	427233	1	19	5.2	5.0	✓
Dissolved Metals in Water by CRC ICPMS	E421	426308	1	16	6.2	5.0	✓
Dissolved Organic Carbon by Combustion (Low Level)	E358-L	422958	1	9	11.1	5.0	✓
Dissolved Orthophosphate by Colourimetry (Ultra Trace Level)	E378-U	423041	1	20	5.0	5.0	✓
Fluoride in Water by IC	E235.F	423047	1	20	5.0	5.0	✓

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 Calgary - Environmental	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 Calgary - Environmental	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
Turbidity by Nephelometry	E121 Calgary - Environmental	Water	APHA 2130 B (mod)	Turbidity is measured by the nephelometric method, by measuring the intensity of light scatter under defined conditions.
ORP by Electrode	E125 Calgary - Environmental	Water	ASTM D1498 (mod)	Oxidation reduction potential is reported as the oxidation-reduction potential of the platinum metal-reference electrode employed, measured in mV. For high accuracy test results, it is recommended that this analysis be conducted in the field.
TSS by Gravimetry (Low Level)	E160-L Calgary - Environmental	Water	APHA 2540 D (mod)	Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, following by drying of the filter at 104 ± 1°C, with gravimetric measurement of the filtered solids. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.
TDS by Gravimetry	E162 Calgary - Environmental	Water	APHA 2540 C (mod)	Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, with evaporation of the filtrate at 180 ± 2°C for 16 hours or to constant weight, with gravimetric measurement of the residue.
Bromide in Water by IC (Low Level)	E235.Br-L Calgary - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Chloride in Water by IC (Low Level)	E235.Cl-L Calgary - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Fluoride in Water by IC	E235.F Calgary - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC (Low Level)	E235.NO2-L Calgary - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC (Low Level)	E235.NO3-L Calgary - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Sulfate in Water by IC	E235.SO4 Calgary - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Acidity by Titration	E283 Calgary - Environmental	Water	APHA 2310 B (mod)	Acidity is determined by potentiometric titration to pH endpoint of 8.3

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Alkalinity Species by Titration	E290 Calgary - Environmental	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 Calgary - Environmental	Water	J. Environ. Monit., 2005, 7, 37-42 (mod)	Ammonia in water is analyzed by flow-injection analysis with fluorescence detection after reaction with orthophthaldialdehyde (OPA).
Total Kjeldahl Nitrogen by Fluorescence (Low Level)	E318 Vancouver - Environmental	Water	APHA 4500-Norg D (mod)	Total Kjeldahl Nitrogen is determined using block digestion followed by flow-injection analysis with fluorescence detection.
Total Organic Carbon (Non-Purgeable) by Combustion (Low Level)	E355-L Calgary - Environmental	Water	APHA 5310 B (mod)	Total Organic Carbon (Non-Purgeable), also known as NPOC (total), is a direct measurement of TOC after an acidified sample has been purged to remove inorganic carbon (IC). Analysis is by high temperature combustion with infrared detection of CO ₂ . NPOC does not include volatile organic species that are purged off with IC. For samples where the majority of total carbon (TC) is comprised of IC (which is common), this method is more accurate and more reliable than the TOC by subtraction method (i.e. TC minus TIC).
Dissolved Organic Carbon by Combustion (Low Level)	E358-L Calgary - Environmental	Water	APHA 5310 B (mod)	Dissolved Organic Carbon (Non-Purgeable), also known as NPOC (dissolved), is a direct measurement of DOC after a filtered (0.45 micron) sample has been acidified and purged to remove inorganic carbon (IC). Analysis is by high temperature combustion with infrared detection of CO ₂ . NPOC does not include volatile organic species that are purged off with IC. For samples where the majority of DC (dissolved carbon) is comprised of IC (which is common), this method is more accurate and more reliable than the DOC by subtraction method (i.e. DC minus DIC).
Total Phosphorus by Colourimetry (Ultra Trace)	E372-U Calgary - Environmental	Water	APHA 4500-P E (mod).	Total Phosphorus is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Dissolved Orthophosphate by Colourimetry (Ultra Trace Level)	E378-U Calgary - Environmental	Water	APHA 4500-P F (mod)	Dissolved Orthophosphate is determined colourimetrically on a sample that has been lab or field filtered through a 0.45 micron membrane filter. Field filtration is recommended to ensure test results represent conditions at time of sampling.
Total Metals in Water by CRC ICPMS	E420 Vancouver - Environmental	Water	EPA 200.2/6020B (mod)	Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Total Chromium in Water by CRC ICPMS (Low Level)	E420.Cr-L Vancouver - Environmental	Water	EPA 200.2/6020B (mod)	Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS.
Dissolved Metals in Water by CRC ICPMS	E421 Vancouver - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Chromium in Water by CRC ICPMS (Low Level)	E421.Cr-L Vancouver - Environmental	Water	APHA 3030 B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS
Total Mercury in Water by CVAFS (Low Level, LOR = 0.5 ppt)	E508-L Vancouver - Environmental	Water	EPA 1631E (mod)	Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAFS.
Dissolved Mercury in Water by CVAAS	E509 Vancouver - Environmental	Water	APHA 3030B/EPA 1631E (mod)	Water samples are filtered (0.45 um), preserved with HCl, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.
Dissolved Hardness (Calculated)	EC100 Vancouver - Environmental	Water	APHA 2340B	"Hardness (as CaCO ₃), dissolved" is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO ₃ equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Ion Balance using Dissolved Metals	EC101 Calgary - Environmental	Water	APHA 1030E	Cation Sum, Anion Sum, and Ion Balance are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Dissolved species are used where available. Minor ions are included where data is present. Ion Balance cannot be calculated accurately for waters with very low electrical conductivity (EC).

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Ammonia	EP298 Calgary - Environmental	Water		Sample preparation for Preserved Nutrients Water Quality Analysis.
Digestion for TKN in water	EP318 Vancouver - Environmental	Water	APHA 4500-Norg D (mod)	Samples are digested using block digestion with Copper Sulfate Digestion Reagent.
Preparation for Total Organic Carbon by Combustion	EP355 Calgary - Environmental	Water		Preparation for Total Organic Carbon by Combustion
Preparation for Dissolved Organic Carbon for Combustion	EP358 Calgary - Environmental	Water	APHA 5310 B (mod)	Preparation for Dissolved Organic Carbon
Digestion for Total Phosphorus in water	EP372 Calgary - Environmental	Water	APHA 4500-P E (mod).	Samples are heated with a persulfate digestion reagent.
Dissolved Metals Water Filtration	EP421 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO ₃ .

QUALITY CONTROL REPORT

Work Order : CG2202406

Page : 1 of 18

Client : Teck Coal Limited
Contact : Mike Pope
Address : RR#1 HWY#3
Sparwood BC Canada V0B 2G1
Telephone : ---
Project : REGIONAL EFFECTS PROGRAM
PO : VPO00816101
C-O-C number : March EVO LAEMP 2022
Sampler : AMC
Site : ---
Quote number : Teck Coal Master Quote
No. of samples received : 8
No. of samples analysed : 8

Laboratory : Calgary - Environmental
Account Manager : Lyudmyla Shvets
Address : 2559 29th Street NE
Calgary, Alberta Canada T1Y 7B5
Telephone : +1 403 407 1800
Date Samples Received : 03-Mar-2022 09:05
Date Analysis Commenced : 03-Mar-2022
Issue Date : 18-Mar-2022 11:33

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
● Matrix Spike (MS) Report; Recovery and Acceptance Limits
● Reference Material (RM) Report; Recovery and Acceptance Limits
● Method Blank (MB) Report; Recovery and Acceptance Limits
● Laboratory Control Sample (LCS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Table with 3 columns: Signatories, Position, Laboratory Department. Lists names like Angela Ren, Caleb Deroche, Erin Sanchez, Harpreet Chawla, Kevin Duarte, Kinny Wu, Lindsay Gung, Oscar Ruiz, Owen Cheng, Ruby Pham, Ruifang Zheng, Sara Niroomand and their respective roles and departments.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.

CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.

DQO = Data Quality Objective.

LOR = Limit of Reporting (detection limit).

RPD = Relative Percentage Difference

= Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Sub-Matrix: Water

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

Date Analysis Commenced : 03-Mar-2022
Issue Date : 15-Mar-2022 17:51

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

<i>Signatories</i>	<i>Position</i>	<i>Laboratory Department</i>
Angela Ren	Team Leader - Metals	Metals, Burnaby, British Columbia
Caleb Deroche	Lab Analyst	Metals, Burnaby, British Columbia
Elke Tabora		Inorganics, Calgary, Alberta
Erin Sanchez		Inorganics, Calgary, Alberta
Harpreet Chawla	Team Leader - Inorganics	Inorganics, Calgary, Alberta
Kevin Duarte	Supervisor - Metals ICP Instrumentation	Metals, Burnaby, British Columbia
Lindsay Gung	Supervisor - Water Chemistry	Inorganics, Burnaby, British Columbia
Owen Cheng		Metals, Burnaby, British Columbia
Ruby Pham	Lab Assistant	Metals, Burnaby, British Columbia
Ruifang Zheng	Analyst	Inorganics, Calgary, Alberta
Sara Niroomand		Inorganics, Calgary, Alberta

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

<i>Unit</i>	<i>Description</i>
-	No Unit
%	percent
µg/L	micrograms per litre
µS/cm	Microsiemens per centimetre
meq/L	milliequivalents per litre
mg/L	milligrams per litre
mV	millivolts
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Qualifiers

<i>Qualifier</i>	<i>Description</i>
DLDS	Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.
DLIS	Detection Limit Adjusted due to insufficient sample.
TKNI	TKN result may be biased low due to Nitrate interference. Nitrate-N is > 10x TKN.

Client	: Teck Coal Limited	Laboratory	: Calgary - Environmental
Contact	: Mike Pope	Account Manager	: Lyudmyla Shvets
Address	: 421 PINE AVE Sparwood BC Canada V0B 2G0	Address	: 2559 29th Street NE Calgary, Alberta Canada T1Y 7B5
Telephone	: ----	Telephone	: +1 403 407 1800
Project	: ELKVIEW OPERATIONS	Date Samples Received	: 03-Mar-2022 09:05
PO	: VPO00816101	Issue Date	: 15-Mar-2022 17:51
C-O-C number	: MARCH EVO LAEMP 2022		
Sampler	: AMC		
Site	: ----		
Quote number	: Teck Coal Master Quote		
No. of samples received	: 1		
No. of samples analysed	: 1		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

- Anonymous:** Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Workorder Comments

Holding times are displayed as "----" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Matrix: **Water** Evaluation: * = Holding time exceedance ; ✓ = Within Holding Time

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water** Evaluation: * = QC frequency outside specification; ✓ = QC frequency within specification.

Quality Control Sample Type	Method	QC Lot #	Count		Frequency (%)		Evaluation
			QC	Regular	Actual	Expected	
Analytical Methods							
Laboratory Duplicates (DUP)							
Acidity by Titration	E283	423829	1	20	5.0	5.0	✓
Alkalinity Species by Titration	E290	423834	1	20	5.0	5.0	✓
Ammonia by Fluorescence	E298	424040	1	20	5.0	5.0	✓

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 Calgary - Environmental	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 Calgary - Environmental	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
Turbidity by Nephelometry	E121 Calgary - Environmental	Water	APHA 2130 B (mod)	Turbidity is measured by the nephelometric method, by measuring the intensity of light scatter under defined conditions.
ORP by Electrode	E125 Calgary - Environmental	Water	ASTM D1498 (mod)	Oxidation reduction potential is reported as the oxidation-reduction potential of the platinum metal-reference electrode employed, measured in mV. For high accuracy test results, it is recommended that this analysis be conducted in the field.
TSS by Gravimetry (Low Level)	E160-L Calgary - Environmental	Water	APHA 2540 D (mod)	Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, following by drying of the filter at 104 ± 1°C, with gravimetric measurement of the filtered solids. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.
TDS by Gravimetry	E162 Calgary - Environmental	Water	APHA 2540 C (mod)	Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, with evaporation of the filtrate at 180 ± 2°C for 16 hours or to constant weight, with gravimetric measurement of the residue.
Bromide in Water by IC (Low Level)	E235.Br-L Calgary - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Chloride in Water by IC (Low Level)	E235.Cl-L Calgary - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Fluoride in Water by IC	E235.F Calgary - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC (Low Level)	E235.NO2-L Calgary - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC (Low Level)	E235.NO3-L Calgary - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Sulfate in Water by IC	E235.SO4 Calgary - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Acidity by Titration	E283 Calgary - Environmental	Water	APHA 2310 B (mod)	Acidity is determined by potentiometric titration to pH endpoint of 8.3

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Alkalinity Species by Titration	E290 Calgary - Environmental	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 Calgary - Environmental	Water	J. Environ. Monit., 2005, 7, 37-42 (mod)	Ammonia in water is analyzed by flow-injection analysis with fluorescence detection after reaction with orthophthaldialdehyde (OPA).
Total Kjeldahl Nitrogen by Fluorescence (Low Level)	E318 Vancouver - Environmental	Water	APHA 4500-Norg D (mod)	Total Kjeldahl Nitrogen is determined using block digestion followed by flow-injection analysis with fluorescence detection.
Total Organic Carbon (Non-Purgeable) by Combustion (Low Level)	E355-L Calgary - Environmental	Water	APHA 5310 B (mod)	Total Organic Carbon (Non-Purgeable), also known as NPOC (total), is a direct measurement of TOC after an acidified sample has been purged to remove inorganic carbon (IC). Analysis is by high temperature combustion with infrared detection of CO ₂ . NPOC does not include volatile organic species that are purged off with IC. For samples where the majority of total carbon (TC) is comprised of IC (which is common), this method is more accurate and more reliable than the TOC by subtraction method (i.e. TC minus TIC).
Dissolved Organic Carbon by Combustion (Low Level)	E358-L Calgary - Environmental	Water	APHA 5310 B (mod)	Dissolved Organic Carbon (Non-Purgeable), also known as NPOC (dissolved), is a direct measurement of DOC after a filtered (0.45 micron) sample has been acidified and purged to remove inorganic carbon (IC). Analysis is by high temperature combustion with infrared detection of CO ₂ . NPOC does not include volatile organic species that are purged off with IC. For samples where the majority of DC (dissolved carbon) is comprised of IC (which is common), this method is more accurate and more reliable than the DOC by subtraction method (i.e. DC minus DIC).
Total Phosphorus by Colourimetry (Ultra Trace)	E372-U Calgary - Environmental	Water	APHA 4500-P E (mod).	Total Phosphorus is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Dissolved Orthophosphate by Colourimetry (Ultra Trace Level)	E378-U Calgary - Environmental	Water	APHA 4500-P F (mod)	Dissolved Orthophosphate is determined colourimetrically on a sample that has been lab or field filtered through a 0.45 micron membrane filter. Field filtration is recommended to ensure test results represent conditions at time of sampling.
Total Metals in Water by CRC ICPMS	E420 Vancouver - Environmental	Water	EPA 200.2/6020B (mod)	Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Total Chromium in Water by CRC ICPMS (Low Level)	E420.Cr-L Vancouver - Environmental	Water	EPA 200.2/6020B (mod)	Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS.
Dissolved Metals in Water by CRC ICPMS	E421 Vancouver - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Chromium in Water by CRC ICPMS (Low Level)	E421.Cr-L Vancouver - Environmental	Water	APHA 3030 B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS
Total Mercury in Water by CVAFS (Low Level, LOR = 0.5 ppt)	E508-L Vancouver - Environmental	Water	EPA 1631E (mod)	Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAFS.
Dissolved Mercury in Water by CVAAS	E509 Vancouver - Environmental	Water	APHA 3030B/EPA 1631E (mod)	Water samples are filtered (0.45 um), preserved with HCl, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.
Dissolved Hardness (Calculated)	EC100 Vancouver - Environmental	Water	APHA 2340B	"Hardness (as CaCO ₃), dissolved" is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO ₃ equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Ion Balance using Dissolved Metals	EC101 Calgary - Environmental	Water	APHA 1030E	Cation Sum, Anion Sum, and Ion Balance are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Dissolved species are used where available. Minor ions are included where data is present. Ion Balance cannot be calculated accurately for waters with very low electrical conductivity (EC).

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Ammonia	EP298 Calgary - Environmental	Water		Sample preparation for Preserved Nutrients Water Quality Analysis.
Digestion for TKN in water	EP318 Vancouver - Environmental	Water	APHA 4500-Norg D (mod)	Samples are digested using block digestion with Copper Sulfate Digestion Reagent.
Preparation for Total Organic Carbon by Combustion	EP355 Calgary - Environmental	Water		Preparation for Total Organic Carbon by Combustion
Preparation for Dissolved Organic Carbon for Combustion	EP358 Calgary - Environmental	Water	APHA 5310 B (mod)	Preparation for Dissolved Organic Carbon
Digestion for Total Phosphorus in water	EP372 Calgary - Environmental	Water	APHA 4500-P E (mod).	Samples are heated with a persulfate digestion reagent.
Dissolved Metals Water Filtration	EP421 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO ₃ .

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
Matrix Spike (MS) Report; Recovery and Acceptance Limits
Reference Material (RM) Report; Recovery and Acceptance Limits
Method Blank (MB) Report; Recovery and Acceptance Limits
Laboratory Control Sample (LCS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Table with 3 columns: Signatories, Position, Laboratory Department. Lists names like Angela Ren, Caleb Deroche, Erin Sanchez, etc., along with their roles and departments.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.

CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.

DQO = Data Quality Objective.

LOR = Limit of Reporting (detection limit).

RPD = Relative Percentage Difference

= Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Qualifiers

Qualifier	Description
TKND	TKN duplication was poor due to interference from high nitrate, which causes negative bias on TKN.

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

Zakieh Lalonde		Inorganics, Calgary, Alberta

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
 LOR: Limit of Reporting (detection limit).

Unit	Description
-	No Unit
%	percent
µg/L	micrograms per litre
µS/cm	Microsiemens per centimetre
meq/L	milliequivalents per litre
mg/L	milligrams per litre
mV	millivolts
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Sample Comments

Sample	Client Id	Comment
CG2204611-001	RG_RIVER_WS_LAEMP_EVO _2022-04-21_NP	Updated WO to rush TAT as per client.

Qualifiers

Qualifier	Description
DLA	Detection Limit adjusted for required dilution.
DLDS	Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).

DTC *Dissolved concentration exceeds total. Results were confirmed by re-analysis.*

DTS *Dissolved Sulfur concentration exceeds total. Negative bias on Total Sulfur suspected due to presence of volatile sulfur species lost during digestion.*

RRV *Reported result verified by repeat analysis.*

TKNI *TKN result may be biased low due to Nitrate interference. Nitrate-N is > 10x TKN.*

QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: CG2204611	Page	: 1 of 27
Client	: Teck Coal Limited	Laboratory	: Calgary - Environmental
Contact	: Mike Pope	Account Manager	: Lyudmyla Shvets
Address	: RR#1 HWY#3 Sparwood BC Canada V0B 2G1	Address	: 2559 29th Street NE Calgary, Alberta Canada T1Y 7B5
Telephone	: ----	Telephone	: +1 403 407 1800
Project	: REGIONAL EFFECTS PROGRAMS	Date Samples Received	: 22-Apr-2022 10:20
PO	: VPO00816101	Issue Date	: 06-May-2022 12:00
C-O-C number	: April EVO LAEMP 2022		
Sampler	: AM		
Site	: ----		
Quote number	: Teck Coal Master Quote		
No. of samples received	: 6		
No. of samples analysed	: 6		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.

CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.

DQO: Data Quality Objective.

LOR: Limit of Reporting (detection limit).

RPD: Relative Percent Difference.

Workorder Comments

Holding times are displayed as "----" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Matrix: **Water** Evaluation: * = Holding time exceedance ; ✓ = Within Holding Time

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended
 Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water** Evaluation: * = QC frequency outside specification; ✓ = QC frequency within specification.

Quality Control Sample Type	Method	QC Lot #	Count		Frequency (%)		Evaluation
			QC	Regular	Actual	Expected	
Analytical Methods							
Laboratory Duplicates (DUP)							
Acidity by Titration	E283	467277	1	20	5.0	5.0	✓
Alkalinity Species by Titration	E290	467100	1	20	5.0	5.0	✓
Ammonia by Fluorescence	E298	466139	1	20	5.0	5.0	✓
Bromide in Water by IC (Low Level)	E235.Br-L	466114	1	20	5.0	5.0	✓
Chloride in Water by IC (Low Level)	E235.Cl-L	466115	1	20	5.0	5.0	✓
Conductivity in Water	E100	467099	1	20	5.0	5.0	✓
Dissolved Chromium in Water by CRC ICPMS (Low Level)	E421.Cr-L	472807	1	19	5.2	5.0	✓
Dissolved Mercury in Water by CVAAS	E509	468958	2	40	5.0	5.0	✓
Dissolved Metals in Water by CRC ICPMS	E421	472806	1	19	5.2	5.0	✓
Dissolved Organic Carbon by Combustion (Low Level)	E358-L	466771	1	14	7.1	5.0	✓
Dissolved Orthophosphate by Colourimetry (Ultra Trace Level 0.001 mg/L)	E378-U	465596	1	19	5.2	5.0	✓
Fluoride in Water by IC	E235.F	466118	1	20	5.0	5.0	✓
Nitrate in Water by IC (Low Level)	E235.NO3-L	466116	1	20	5.0	5.0	✓
Nitrite in Water by IC (Low Level)	E235.NO2-L	466117	1	20	5.0	5.0	✓

Total Phosphorus by Colourimetry (0.002 mg/L)	E372-U	466041	1	20	5.0	5.0	✓

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 Calgary - Environmental	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 Calgary - Environmental	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
Turbidity by Nephelometry	E121 Calgary - Environmental	Water	APHA 2130 B (mod)	Turbidity is measured by the nephelometric method, by measuring the intensity of light scatter under defined conditions.
ORP by Electrode	E125 Calgary - Environmental	Water	ASTM D1498 (mod)	Oxidation reduction potential is reported as the oxidation-reduction potential of the platinum metal-reference electrode employed, measured in mV. For high accuracy test results, it is recommended that this analysis be conducted in the field.
TSS by Gravimetry (Low Level)	E160-L Calgary - Environmental	Water	APHA 2540 D (mod)	Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, following by drying of the filter at 104 ± 1°C, with gravimetric measurement of the filtered solids. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.
TDS by Gravimetry	E162 Calgary - Environmental	Water	APHA 2540 C (mod)	Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, with evaporation of the filtrate at 180 ± 2°C for 16 hours or to constant weight, with gravimetric measurement of the residue.
Bromide in Water by IC (Low Level)	E235.Br-L Calgary - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Chloride in Water by IC (Low Level)	E235.Cl-L Calgary - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Fluoride in Water by IC	E235.F Calgary - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC (Low Level)	E235.NO2-L Calgary - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC (Low Level)	E235.NO3-L Calgary - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Sulfate in Water by IC	E235.SO4 Calgary - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Acidity by Titration	E283 Calgary - Environmental	Water	APHA 2310 B (mod)	Acidity is determined by potentiometric titration to pH endpoint of 8.3

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Alkalinity Species by Titration	E290 Calgary - Environmental	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 Calgary - Environmental	Water	J. Environ. Monit., 2005, 7, 37-42 (mod)	Ammonia in water is analyzed by flow-injection analysis with fluorescence detection after reaction with orthophthaldialdehyde (OPA).
Total Kjeldahl Nitrogen by Fluorescence (Low Level)	E318 Calgary - Environmental	Water	APHA 4500-Norg D (mod)	Total Kjeldahl Nitrogen is determined using block digestion followed by flow-injection analysis with fluorescence detection.
Total Organic Carbon (Non-Purgeable) by Combustion (Low Level)	E355-L Calgary - Environmental	Water	APHA 5310 B (mod)	Total Organic Carbon (Non-Purgeable), also known as NPOC (total), is a direct measurement of TOC after an acidified sample has been purged to remove inorganic carbon (IC). Analysis is by high temperature combustion with infrared detection of CO ₂ . NPOC does not include volatile organic species that are purged off with IC. For samples where the majority of total carbon (TC) is comprised of IC (which is common), this method is more accurate and more reliable than the TOC by subtraction method (i.e. TC minus TIC).
Dissolved Organic Carbon by Combustion (Low Level)	E358-L Calgary - Environmental	Water	APHA 5310 B (mod)	Dissolved Organic Carbon (Non-Purgeable), also known as NPOC (dissolved), is a direct measurement of DOC after a filtered (0.45 micron) sample has been acidified and purged to remove inorganic carbon (IC). Analysis is by high temperature combustion with infrared detection of CO ₂ . NPOC does not include volatile organic species that are purged off with IC. For samples where the majority of DC (dissolved carbon) is comprised of IC (which is common), this method is more accurate and more reliable than the DOC by subtraction method (i.e. DC minus DIC).
Total Phosphorus by Colourimetry (0.002 mg/L)	E372-U Calgary - Environmental	Water	APHA 4500-P E (mod).	Total Phosphorus is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Dissolved Orthophosphate by Colourimetry (Ultra Trace Level 0.001 mg/L)	E378-U Calgary - Environmental	Water	APHA 4500-P F (mod)	Dissolved Orthophosphate is determined colourimetrically on a sample that has been lab or field filtered through a 0.45 micron membrane filter. Field filtration is recommended to ensure test results represent conditions at time of sampling.
Total Metals in Water by CRC ICPMS	E420 Vancouver - Environmental	Water	EPA 200.2/6020B (mod)	Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Total Chromium in Water by CRC ICPMS (Low Level)	E420.Cr-L Vancouver - Environmental	Water	EPA 200.2/6020B (mod)	Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS.
Dissolved Metals in Water by CRC ICPMS	E421 Vancouver - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Chromium in Water by CRC ICPMS (Low Level)	E421.Cr-L Vancouver - Environmental	Water	APHA 3030 B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS
Total Mercury in Water by CVAAS	E508 Vancouver - Environmental	Water	EPA 1631E (mod)	Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS
Total Mercury in Water by CVAFS (Low Level, LOR = 0.5 ppt)	E508-L Vancouver - Environmental	Water	EPA 1631E (mod)	Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAFS.
Dissolved Mercury in Water by CVAAS	E509 Vancouver - Environmental	Water	APHA 3030B/EPA 1631E (mod)	Water samples are filtered (0.45 um), preserved with HCl, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.
Dissolved Hardness (Calculated)	EC100 Vancouver - Environmental	Water	APHA 2340B	"Hardness (as CaCO ₃), dissolved" is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO ₃ equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Ion Balance using Dissolved Metals	EC101 Calgary - Environmental	Water	APHA 1030E	Cation Sum, Anion Sum, and Ion Balance are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Dissolved species are used where available. Minor ions are included where data is present. Ion Balance cannot be calculated accurately for waters with very low electrical conductivity (EC).

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Ammonia	EP298 Calgary - Environmental	Water		Sample preparation for Preserved Nutrients Water Quality Analysis.
Digestion for TKN in water	EP318 Calgary - Environmental	Water	APHA 4500-Norg D (mod)	Samples are digested using block digestion with Copper Sulfate Digestion Reagent.
Preparation for Total Organic Carbon by Combustion	EP355 Calgary - Environmental	Water		Preparation for Total Organic Carbon by Combustion
Preparation for Dissolved Organic Carbon for Combustion	EP358 Calgary - Environmental	Water	APHA 5310 B (mod)	Preparation for Dissolved Organic Carbon
Digestion for Total Phosphorus in water	EP372 Calgary - Environmental	Water	APHA 4500-P E (mod).	Samples are heated with a persulfate digestion reagent.
Dissolved Metals Water Filtration	EP421	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO ₃ .

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.

CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.

DQO = Data Quality Objective.

LOR = Limit of Reporting (detection limit).

RPD = Relative Percentage Difference

= Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

Date Analysis Commenced : 22-Apr-2022
Issue Date : 05-May-2022 08:36

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

<i>Signatories</i>	<i>Position</i>	<i>Laboratory Department</i>
Anthony Calero	Team Leader - Inorganics	Inorganics, Calgary, Alberta
Dee Lee	Analyst	Metals, Burnaby, British Columbia
Delson Resende	Lab Assistant	Metals, Burnaby, British Columbia
Dwayne Bennett	Supervisor - Inorganic	Inorganics, Calgary, Alberta
Elke Tabora		Inorganics, Calgary, Alberta
Erin Sanchez		Inorganics, Calgary, Alberta
Harpreet Chawla	Team Leader - Inorganics	Inorganics, Calgary, Alberta
Kevin Duarte	Supervisor - Metals ICP Instrumentation	Metals, Burnaby, British Columbia
Ruifang Zheng	Analyst	Inorganics, Calgary, Alberta
Sara Niroomand		Inorganics, Calgary, Alberta
Zakieh Lalonde		Inorganics, Calgary, Alberta

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
 LOR: Limit of Reporting (detection limit).

Unit	Description
-	No Unit
%	percent
µg/L	micrograms per litre
µS/cm	Microsiemens per centimetre
meq/L	milliequivalents per litre
mg/L	milligrams per litre
mV	millivolts
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Sample Comments

Sample	Client Id	Comment
CG2204613-001	EV_BRD_LOT2_WS_LAEMP_ EVO_2022-04-21_NP	Updated WO to rush TAT as per client.

Qualifiers

Qualifier	Description
DLA	Detection Limit adjusted for required dilution.
DLDS	Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.

QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: CG2204613	Page	: 1 of 13
Client	: Teck Coal Limited	Laboratory	: Calgary - Environmental
Contact	: Mike Pope	Account Manager	: Lyudmyla Shvets
Address	: 421 PINE AVE Sparwood BC Canada V0B 2G0	Address	: 2559 29th Street NE Calgary, Alberta Canada T1Y 7B5
Telephone	: ----	Telephone	: +1 403 407 1800
Project	: ELKVIEW OPERATIONS	Date Samples Received	: 22-Apr-2022 10:20
PO	: VPO00816101	Issue Date	: 05-May-2022 08:37
C-O-C number	: EVO LAEMP_2022_APR_ALS		
Sampler	: AM		
Site	: ----		
Quote number	: Teck Coal Master Quote		
No. of samples received	: 1		
No. of samples analysed	: 1		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.

CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.

DQO: Data Quality Objective.

LOR: Limit of Reporting (detection limit).

RPD: Relative Percent Difference.

Workorder Comments

Holding times are displayed as "----" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Matrix: **Water** Evaluation: * = Holding time exceedance ; ✓ = Within Holding Time

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water** Evaluation: * = QC frequency outside specification; ✓ = QC frequency within specification.

Quality Control Sample Type	Method	QC Lot #	Count		Frequency (%)		Evaluation
			QC	Regular	Actual	Expected	
Analytical Methods							
Laboratory Duplicates (DUP)							
Acidity by Titration	E283	467277	1	20	5.0	5.0	✓
Alkalinity Species by Titration	E290	467100	1	20	5.0	5.0	✓

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 Calgary - Environmental	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 Calgary - Environmental	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
Turbidity by Nephelometry	E121 Calgary - Environmental	Water	APHA 2130 B (mod)	Turbidity is measured by the nephelometric method, by measuring the intensity of light scatter under defined conditions.
ORP by Electrode	E125 Calgary - Environmental	Water	ASTM D1498 (mod)	Oxidation reduction potential is reported as the oxidation-reduction potential of the platinum metal-reference electrode employed, measured in mV. For high accuracy test results, it is recommended that this analysis be conducted in the field.
TSS by Gravimetry (Low Level)	E160-L Calgary - Environmental	Water	APHA 2540 D (mod)	Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, following by drying of the filter at 104 ± 1°C, with gravimetric measurement of the filtered solids. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.
TDS by Gravimetry	E162 Calgary - Environmental	Water	APHA 2540 C (mod)	Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, with evaporation of the filtrate at 180 ± 2°C for 16 hours or to constant weight, with gravimetric measurement of the residue.
Bromide in Water by IC (Low Level)	E235.Br-L Calgary - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Chloride in Water by IC (Low Level)	E235.Cl-L Calgary - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Fluoride in Water by IC	E235.F Calgary - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC (Low Level)	E235.NO2-L Calgary - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC (Low Level)	E235.NO3-L Calgary - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Sulfate in Water by IC	E235.SO4 Calgary - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Acidity by Titration	E283 Calgary - Environmental	Water	APHA 2310 B (mod)	Acidity is determined by potentiometric titration to pH endpoint of 8.3

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Alkalinity Species by Titration	E290 Calgary - Environmental	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 Calgary - Environmental	Water	J. Environ. Monit., 2005, 7, 37-42 (mod)	Ammonia in water is analyzed by flow-injection analysis with fluorescence detection after reaction with orthophthaldialdehyde (OPA).
Total Kjeldahl Nitrogen by Fluorescence (Low Level)	E318 Calgary - Environmental	Water	APHA 4500-Norg D (mod)	Total Kjeldahl Nitrogen is determined using block digestion followed by flow-injection analysis with fluorescence detection.
Total Organic Carbon (Non-Purgeable) by Combustion (Low Level)	E355-L Calgary - Environmental	Water	APHA 5310 B (mod)	Total Organic Carbon (Non-Purgeable), also known as NPOC (total), is a direct measurement of TOC after an acidified sample has been purged to remove inorganic carbon (IC). Analysis is by high temperature combustion with infrared detection of CO ₂ . NPOC does not include volatile organic species that are purged off with IC. For samples where the majority of total carbon (TC) is comprised of IC (which is common), this method is more accurate and more reliable than the TOC by subtraction method (i.e. TC minus TIC).
Dissolved Organic Carbon by Combustion (Low Level)	E358-L Calgary - Environmental	Water	APHA 5310 B (mod)	Dissolved Organic Carbon (Non-Purgeable), also known as NPOC (dissolved), is a direct measurement of DOC after a filtered (0.45 micron) sample has been acidified and purged to remove inorganic carbon (IC). Analysis is by high temperature combustion with infrared detection of CO ₂ . NPOC does not include volatile organic species that are purged off with IC. For samples where the majority of DC (dissolved carbon) is comprised of IC (which is common), this method is more accurate and more reliable than the DOC by subtraction method (i.e. DC minus DIC).
Total Phosphorus by Colourimetry (0.002 mg/L)	E372-U Calgary - Environmental	Water	APHA 4500-P E (mod).	Total Phosphorus is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Dissolved Orthophosphate by Colourimetry (Ultra Trace Level 0.001 mg/L)	E378-U Calgary - Environmental	Water	APHA 4500-P F (mod)	Dissolved Orthophosphate is determined colourimetrically on a sample that has been lab or field filtered through a 0.45 micron membrane filter. Field filtration is recommended to ensure test results represent conditions at time of sampling.
Total Metals in Water by CRC ICPMS	E420 Vancouver - Environmental	Water	EPA 200.2/6020B (mod)	Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Total Chromium in Water by CRC ICPMS (Low Level)	E420.Cr-L Vancouver - Environmental	Water	EPA 200.2/6020B (mod)	Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS.
Dissolved Metals in Water by CRC ICPMS	E421 Vancouver - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Chromium in Water by CRC ICPMS (Low Level)	E421.Cr-L Vancouver - Environmental	Water	APHA 3030 B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS
Total Mercury in Water by CVAFS (Low Level, LOR = 0.5 ppt)	E508-L Vancouver - Environmental	Water	EPA 1631E (mod)	Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAFS.
Dissolved Mercury in Water by CVAAS	E509 Vancouver - Environmental	Water	APHA 3030B/EPA 1631E (mod)	Water samples are filtered (0.45 um), preserved with HCl, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.
Dissolved Hardness (Calculated)	EC100 Vancouver - Environmental	Water	APHA 2340B	"Hardness (as CaCO ₃), dissolved" is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO ₃ equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Ion Balance using Dissolved Metals	EC101 Calgary - Environmental	Water	APHA 1030E	Cation Sum, Anion Sum, and Ion Balance are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Dissolved species are used where available. Minor ions are included where data is present. Ion Balance cannot be calculated accurately for waters with very low electrical conductivity (EC).

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Ammonia	EP298 Calgary - Environmental	Water		Sample preparation for Preserved Nutrients Water Quality Analysis.
Digestion for TKN in water	EP318 Calgary - Environmental	Water	APHA 4500-Norg D (mod)	Samples are digested using block digestion with Copper Sulfate Digestion Reagent.
Preparation for Total Organic Carbon by Combustion	EP355 Calgary - Environmental	Water		Preparation for Total Organic Carbon by Combustion
Preparation for Dissolved Organic Carbon for Combustion	EP358 Calgary - Environmental	Water	APHA 5310 B (mod)	Preparation for Dissolved Organic Carbon
Digestion for Total Phosphorus in water	EP372 Calgary - Environmental	Water	APHA 4500-P E (mod).	Samples are heated with a persulfate digestion reagent.
Dissolved Metals Water Filtration	EP421 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO ₃ .
Dissolved Mercury Water Filtration	EP509	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HCl.

Date Samples Received : 22-Apr-2022 10:20
Date Analysis Commenced : 22-Apr-2022
Issue Date : 05-May-2022 08:37

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
● Matrix Spike (MS) Report; Recovery and Acceptance Limits
● Reference Material (RM) Report; Recovery and Acceptance Limits
● Method Blank (MB) Report; Recovery and Acceptance Limits
● Laboratory Control Sample (LCS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Table with 3 columns: Signatories, Position, Laboratory Department. Lists names like Anthony Calero, Dee Lee, Delson Resende, etc., along with their roles and departments.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.

CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.

DQO = Data Quality Objective.

LOR = Limit of Reporting (detection limit).

RPD = Relative Percentage Difference

= Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

CERTIFICATE OF ANALYSIS

Work Order : **CG2204866**
Client : **Teck Coal Limited**
Contact : Mike Pope
Address : RR#1 HWY#3
Sparwood BC Canada V0B 2G1
Telephone : ----
Project : REGIONAL EFFECTS PROGRAM
PO : VPO00816101
C-O-C number : April EVO LAEMP 2022
Sampler : AM
Site : ----
Quote number : Teck Coal Master Quote
No. of samples received : 8
No. of samples analysed : 8

Page : 1 of 10
Laboratory : Calgary - Environmental
Account Manager : Lyudmyla Shvets
Address : 2559 29th Street NE
Calgary AB Canada T1Y 7B5
Telephone : +1 403 407 1800
Date Samples Received : 27-Apr-2022 10:10
Date Analysis Commenced : 28-Apr-2022
Issue Date : 11-May-2022 17:01

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

<i>Signatories</i>	<i>Position</i>	<i>Laboratory Department</i>
Anthony Calero	Team Leader - Inorganics	Inorganics, Calgary, Alberta
Caleb Deroche	Lab Analyst	Metals, Burnaby, British Columbia
Elke Tabora		Inorganics, Calgary, Alberta
Kevin Duarte	Supervisor - Metals ICP Instrumentation	Metals, Burnaby, British Columbia
Kim Jensen	Department Manager - Metals	Metals, Burnaby, British Columbia
Kyle Chang	Lab Assistant	Metals, Burnaby, British Columbia
Oscar Ruiz	Lab Assistant	Inorganics, Calgary, Alberta
Owen Cheng		Metals, Burnaby, British Columbia
Ruby Pham	Lab Assistant	Metals, Burnaby, British Columbia
Ruifang Zheng	Analyst	Inorganics, Calgary, Alberta
Sara Niroomand		Inorganics, Calgary, Alberta
Shaneel Dayal	Analyst	Metals, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
 LOR: Limit of Reporting (detection limit).

<i>Unit</i>	<i>Description</i>
-	No Unit
%	percent
µg/L	micrograms per litre
µS/cm	Microsiemens per centimetre
meq/L	milliequivalents per litre
mg/L	milligrams per litre
mV	millivolts
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Qualifiers

<i>Qualifier</i>	<i>Description</i>
DLDS	Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).
DTC	Dissolved concentration exceeds total. Results were confirmed by re-analysis.
TKNI	TKN result may be biased low due to Nitrate interference. Nitrate-N is > 10x TKN.

QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: CG2204866	Page	: 1 of 34
Client	: Teck Coal Limited	Laboratory	: Calgary - Environmental
Contact	: Mike Pope	Account Manager	: Lyudmyla Shvets
Address	: RR#1 HWY#3 Sparwood BC Canada V0B 2G1	Address	: 2559 29th Street NE Calgary, Alberta Canada T1Y 7B5
Telephone	: ----	Telephone	: +1 403 407 1800
Project	: REGIONAL EFFECTS PROGRAM	Date Samples Received	: 27-Apr-2022 10:10
PO	: VPO00816101	Issue Date	: 11-May-2022 17:01
C-O-C number	: April EVO LAEMP 2022		
Sampler	: AM		
Site	: ----		
Quote number	: Teck Coal Master Quote		
No. of samples received	: 8		
No. of samples analysed	: 8		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

- Anonymous:** Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Workorder Comments

Holding times are displayed as "----" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- Matrix Spike outliers occur - please see following pages for full details.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **Water**

Analyte Group	Laboratory sample ID	Client/Ref Sample ID	Analyte	CAS Number	Method	Result	Limits	Comment
Matrix Spike (MS) Recoveries								
Anions and Nutrients	CG2204866-007	RG_ERCKUT_WS_L AEMP_EVO_2022-04 _NP	Kjeldahl nitrogen, total [TKN]	----	E318	68.0 % MSTN	70.0-130%	Recovery less than lower data quality objective

Result Qualifiers

Qualifier	Description
MSTN	TKN Matrix Spike recovery was low due to interference from high nitrate, which causes negative bias on TKN.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Matrix: **Water** Evaluation: * = Holding time exceedance ; ✓ = Within Holding Time

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

Page : 27 of 34
Work Order : CG2204866
Client : Teck Coal Limited
Project : REGIONAL EFFECTS PROGRAM

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water** Evaluation: * = QC frequency outside specification; ✓ = QC frequency within specification.

Quality Control Sample Type	Method	QC Lot #	Count		Frequency (%)		Evaluation
			QC	Regular	Actual	Expected	
Analytical Methods							
Laboratory Duplicates (DUP)							
Acidity by Titration	E283	472129	1	20	5.0	5.0	✓
Alkalinity Species by Titration	E290	471087	2	38	5.2	5.0	✓
Ammonia by Fluorescence	E298	470867	1	20	5.0	5.0	✓
Bromide in Water by IC (Low Level)	E235.Br-L	470691	1	16	6.2	5.0	✓
Chloride in Water by IC (Low Level)	E235.Cl-L	470692	1	16	6.2	5.0	✓
Conductivity in Water	E100	471085	2	38	5.2	5.0	✓

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 Calgary - Environmental	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 Calgary - Environmental	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
Turbidity by Nephelometry	E121 Calgary - Environmental	Water	APHA 2130 B (mod)	Turbidity is measured by the nephelometric method, by measuring the intensity of light scatter under defined conditions.
ORP by Electrode	E125 Calgary - Environmental	Water	ASTM D1498 (mod)	Oxidation reduction potential is reported as the oxidation-reduction potential of the platinum metal-reference electrode employed, measured in mV. For high accuracy test results, it is recommended that this analysis be conducted in the field.
TSS by Gravimetry (Low Level)	E160-L Calgary - Environmental	Water	APHA 2540 D (mod)	Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, following by drying of the filter at 104 ± 1°C, with gravimetric measurement of the filtered solids. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.
TDS by Gravimetry	E162 Calgary - Environmental	Water	APHA 2540 C (mod)	Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, with evaporation of the filtrate at 180 ± 2°C for 16 hours or to constant weight, with gravimetric measurement of the residue.
Bromide in Water by IC (Low Level)	E235.Br-L Calgary - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Chloride in Water by IC (Low Level)	E235.Cl-L Calgary - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Fluoride in Water by IC	E235.F Calgary - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC (Low Level)	E235.NO2-L Calgary - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC (Low Level)	E235.NO3-L Calgary - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Sulfate in Water by IC	E235.SO4 Calgary - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Acidity by Titration	E283 Calgary - Environmental	Water	APHA 2310 B (mod)	Acidity is determined by potentiometric titration to pH endpoint of 8.3

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Alkalinity Species by Titration	E290 Calgary - Environmental	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 Calgary - Environmental	Water	J. Environ. Monit., 2005, 7, 37-42 (mod)	Ammonia in water is analyzed by flow-injection analysis with fluorescence detection after reaction with orthophthaldialdehyde (OPA).
Total Kjeldahl Nitrogen by Fluorescence (Low Level)	E318 Calgary - Environmental	Water	APHA 4500-Norg D (mod)	Total Kjeldahl Nitrogen is determined using block digestion followed by flow-injection analysis with fluorescence detection.
Total Organic Carbon (Non-Purgeable) by Combustion (Low Level)	E355-L Calgary - Environmental	Water	APHA 5310 B (mod)	Total Organic Carbon (Non-Purgeable), also known as NPOC (total), is a direct measurement of TOC after an acidified sample has been purged to remove inorganic carbon (IC). Analysis is by high temperature combustion with infrared detection of CO ₂ . NPOC does not include volatile organic species that are purged off with IC. For samples where the majority of total carbon (TC) is comprised of IC (which is common), this method is more accurate and more reliable than the TOC by subtraction method (i.e. TC minus TIC).
Dissolved Organic Carbon by Combustion (Low Level)	E358-L Calgary - Environmental	Water	APHA 5310 B (mod)	Dissolved Organic Carbon (Non-Purgeable), also known as NPOC (dissolved), is a direct measurement of DOC after a filtered (0.45 micron) sample has been acidified and purged to remove inorganic carbon (IC). Analysis is by high temperature combustion with infrared detection of CO ₂ . NPOC does not include volatile organic species that are purged off with IC. For samples where the majority of DC (dissolved carbon) is comprised of IC (which is common), this method is more accurate and more reliable than the DOC by subtraction method (i.e. DC minus DIC).
Total Phosphorus by Colourimetry (0.002 mg/L)	E372-U Calgary - Environmental	Water	APHA 4500-P E (mod).	Total Phosphorus is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Dissolved Orthophosphate by Colourimetry (Ultra Trace Level 0.001 mg/L)	E378-U Calgary - Environmental	Water	APHA 4500-P F (mod)	Dissolved Orthophosphate is determined colourimetrically on a sample that has been lab or field filtered through a 0.45 micron membrane filter. Field filtration is recommended to ensure test results represent conditions at time of sampling.
Total Metals in Water by CRC ICPMS	E420 Vancouver - Environmental	Water	EPA 200.2/6020B (mod)	Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Total Chromium in Water by CRC ICPMS (Low Level)	E420.Cr-L Vancouver - Environmental	Water	EPA 200.2/6020B (mod)	Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS.
Dissolved Metals in Water by CRC ICPMS	E421 Vancouver - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Chromium in Water by CRC ICPMS (Low Level)	E421.Cr-L Vancouver - Environmental	Water	APHA 3030 B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS
Total Mercury in Water by CVAFS (Low Level, LOR = 0.5 ppt)	E508-L Vancouver - Environmental	Water	EPA 1631E (mod)	Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAFS.
Dissolved Mercury in Water by CVAAS	E509 Vancouver - Environmental	Water	APHA 3030B/EPA 1631E (mod)	Water samples are filtered (0.45 um), preserved with HCl, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.
Dissolved Hardness (Calculated)	EC100 Vancouver - Environmental	Water	APHA 2340B	"Hardness (as CaCO ₃), dissolved" is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO ₃ equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Ion Balance using Dissolved Metals	EC101 Calgary - Environmental	Water	APHA 1030E	Cation Sum, Anion Sum, and Ion Balance are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Dissolved species are used where available. Minor ions are included where data is present. Ion Balance cannot be calculated accurately for waters with very low electrical conductivity (EC).

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Ammonia	EP298 Calgary - Environmental	Water		Sample preparation for Preserved Nutrients Water Quality Analysis.
Digestion for TKN in water	EP318 Calgary - Environmental	Water	APHA 4500-Norg D (mod)	Samples are digested using block digestion with Copper Sulfate Digestion Reagent.
Preparation for Total Organic Carbon by Combustion	EP355 Calgary - Environmental	Water		Preparation for Total Organic Carbon by Combustion
Preparation for Dissolved Organic Carbon for Combustion	EP358 Calgary - Environmental	Water	APHA 5310 B (mod)	Preparation for Dissolved Organic Carbon
Digestion for Total Phosphorus in water	EP372 Calgary - Environmental	Water	APHA 4500-P E (mod).	Samples are heated with a persulfate digestion reagent.
Dissolved Metals Water Filtration	EP421 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO ₃ .
Dissolved Mercury Water Filtration	EP509	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HCl.

QUALITY CONTROL REPORT

Work Order : CG2204866

Page : 1 of 18

Client : Teck Coal Limited
Contact : Mike Pope
Address : RR#1 HWY#3
Sparwood BC Canada V0B 2G1
Telephone : ----
Project : REGIONAL EFFECTS PROGRAM
PO : VPO00816101
C-O-C number : April EVO LAEMP 2022
Sampler : AM
Site : ----
Quote number : Teck Coal Master Quote
No. of samples received : 8
No. of samples analysed : 8

Laboratory : Calgary - Environmental
Account Manager : Lyudmyla Shvets
Address : 2559 29th Street NE
Calgary, Alberta Canada T1Y 7B5
Telephone : +1 403 407 1800
Date Samples Received : 27-Apr-2022 10:10
Date Analysis Commenced : 28-Apr-2022
Issue Date : 11-May-2022 17:01

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
Matrix Spike (MS) Report; Recovery and Acceptance Limits
Reference Material (RM) Report; Recovery and Acceptance Limits
Method Blank (MB) Report; Recovery and Acceptance Limits
Laboratory Control Sample (LCS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Table with 3 columns: Signatories, Position, Laboratory Department. Lists names like Anthony Calero, Caleb Deroche, etc., and their roles and departments.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.

CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.

DQO = Data Quality Objective.

LOR = Limit of Reporting (detection limit).

RPD = Relative Percentage Difference

= Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Sub-Matrix: Water

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

No. of samples received : 1
No. of samples analysed : 1

Page : 1 of 7
Laboratory : Calgary - Environmental
Account Manager : Lyudmyla Shvets
Address : 2559 29th Street NE
Calgary AB Canada T1Y 7B5
Telephone : +1 403 407 1800
Date Samples Received : 27-Apr-2022 10:10
Date Analysis Commenced : 28-Apr-2022
Issue Date : 05-May-2022 17:26

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

<i>Signatories</i>	<i>Position</i>	<i>Laboratory Department</i>
Anthony Calero	Team Leader - Inorganics	Inorganics, Calgary, Alberta
Dan Gebert	Laboratory Analyst	Metals, Burnaby, British Columbia
Elke Tabora		Inorganics, Calgary, Alberta
Harpreet Chawla	Team Leader - Inorganics	Inorganics, Calgary, Alberta
Kevin Duarte	Supervisor - Metals ICP Instrumentation	Metals, Burnaby, British Columbia
Kim Jensen	Department Manager - Metals	Metals, Burnaby, British Columbia
Owen Cheng		Metals, Burnaby, British Columbia
Ruifang Zheng	Analyst	Inorganics, Calgary, Alberta
Sara Niroomand		Inorganics, Calgary, Alberta
Shaneel Dayal	Analyst	Metals, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
 LOR: Limit of Reporting (detection limit).

Unit	Description
-	No Unit
%	percent
µg/L	micrograms per litre
µS/cm	Microsiemens per centimetre
meq/L	milliequivalents per litre
mg/L	milligrams per litre
mV	millivolts
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Sample Comments

Sample	Client Id	Comment
CG2204876-001	EV_EC_BRIDGE_WS_LAEMP_ EVO_2022-04_NP	Updated WO to rush TAT as per client.
CG2204876-001	EV_EC_BRIDGE_WS_LAEMP_ EVO_2022-04_NP	Water sample for total mercury analysis was not submitted in glass or PTFE container with HCl preservative. Results may be biased low.

Qualifiers

Qualifier	Description
DLDS	Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.
TKNI	TKN result may be biased low due to Nitrate interference. Nitrate-N is > 10x TKN.

QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: CG2204876	Page	: 1 of 13
Client	: Teck Coal Limited	Laboratory	: Calgary - Environmental
Contact	: Mike Pope	Account Manager	: Lyudmyla Shvets
Address	: 421 PINE AVE Sparwood BC Canada V0B 2G0	Address	: 2559 29th Street NE Calgary, Alberta Canada T1Y 7B5
Telephone	: ----	Telephone	: +1 403 407 1800
Project	: ELKVIEW OPERATIONS	Date Samples Received	: 27-Apr-2022 10:10
PO	: VPO00816101	Issue Date	: 05-May-2022 17:26
C-O-C number	: EVO LAEMP_2022_APR_ALS		
Sampler	: Alex McClymont		
Site	: ----		
Quote number	: Teck Coal Master Quote		
No. of samples received	: 1		
No. of samples analysed	: 1		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.

CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.

DQO: Data Quality Objective.

LOR: Limit of Reporting (detection limit).

RPD: Relative Percent Difference.

Workorder Comments

Holding times are displayed as "----" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Matrix: **Water** Evaluation: * = Holding time exceedance ; ✓ = Within Holding Time

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water** Evaluation: * = QC frequency outside specification; ✓ = QC frequency within specification.

Quality Control Sample Type	Method	QC Lot #	Count		Frequency (%)		Evaluation
			QC	Regular	Actual	Expected	
Analytical Methods							
Laboratory Duplicates (DUP)							
Acidity by Titration	E283	471469	1	20	5.0	5.0	✓
Alkalinity Species by Titration	E290	471464	1	15	6.6	5.0	✓
Ammonia by Fluorescence	E298	470869	1	17	5.8	5.0	✓
Bromide in Water by IC (Low Level)	E235.Br-L	470814	1	20	5.0	5.0	✓

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 Calgary - Environmental	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 Calgary - Environmental	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
Turbidity by Nephelometry	E121 Calgary - Environmental	Water	APHA 2130 B (mod)	Turbidity is measured by the nephelometric method, by measuring the intensity of light scatter under defined conditions.
ORP by Electrode	E125 Calgary - Environmental	Water	ASTM D1498 (mod)	Oxidation reduction potential is reported as the oxidation-reduction potential of the platinum metal-reference electrode employed, measured in mV. For high accuracy test results, it is recommended that this analysis be conducted in the field.
TSS by Gravimetry (Low Level)	E160-L Calgary - Environmental	Water	APHA 2540 D (mod)	Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, following by drying of the filter at 104 ± 1°C, with gravimetric measurement of the filtered solids. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.
TDS by Gravimetry	E162 Calgary - Environmental	Water	APHA 2540 C (mod)	Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, with evaporation of the filtrate at 180 ± 2°C for 16 hours or to constant weight, with gravimetric measurement of the residue.
Bromide in Water by IC (Low Level)	E235.Br-L Calgary - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Chloride in Water by IC (Low Level)	E235.Cl-L Calgary - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Fluoride in Water by IC	E235.F Calgary - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC (Low Level)	E235.NO2-L Calgary - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC (Low Level)	E235.NO3-L Calgary - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Sulfate in Water by IC	E235.SO4 Calgary - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Acidity by Titration	E283 Calgary - Environmental	Water	APHA 2310 B (mod)	Acidity is determined by potentiometric titration to pH endpoint of 8.3

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Alkalinity Species by Titration	E290 Calgary - Environmental	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 Calgary - Environmental	Water	J. Environ. Monit., 2005, 7, 37-42 (mod)	Ammonia in water is analyzed by flow-injection analysis with fluorescence detection after reaction with orthophthaldialdehyde (OPA).
Total Kjeldahl Nitrogen by Fluorescence (Low Level)	E318 Calgary - Environmental	Water	APHA 4500-Norg D (mod)	Total Kjeldahl Nitrogen is determined using block digestion followed by flow-injection analysis with fluorescence detection.
Total Organic Carbon (Non-Purgeable) by Combustion (Low Level)	E355-L Calgary - Environmental	Water	APHA 5310 B (mod)	Total Organic Carbon (Non-Purgeable), also known as NPOC (total), is a direct measurement of TOC after an acidified sample has been purged to remove inorganic carbon (IC). Analysis is by high temperature combustion with infrared detection of CO ₂ . NPOC does not include volatile organic species that are purged off with IC. For samples where the majority of total carbon (TC) is comprised of IC (which is common), this method is more accurate and more reliable than the TOC by subtraction method (i.e. TC minus TIC).
Dissolved Organic Carbon by Combustion (Low Level)	E358-L Calgary - Environmental	Water	APHA 5310 B (mod)	Dissolved Organic Carbon (Non-Purgeable), also known as NPOC (dissolved), is a direct measurement of DOC after a filtered (0.45 micron) sample has been acidified and purged to remove inorganic carbon (IC). Analysis is by high temperature combustion with infrared detection of CO ₂ . NPOC does not include volatile organic species that are purged off with IC. For samples where the majority of DC (dissolved carbon) is comprised of IC (which is common), this method is more accurate and more reliable than the DOC by subtraction method (i.e. DC minus DIC).
Total Phosphorus by Colourimetry (0.002 mg/L)	E372-U Calgary - Environmental	Water	APHA 4500-P E (mod).	Total Phosphorus is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Dissolved Orthophosphate by Colourimetry (Ultra Trace Level 0.001 mg/L)	E378-U Calgary - Environmental	Water	APHA 4500-P F (mod)	Dissolved Orthophosphate is determined colourimetrically on a sample that has been lab or field filtered through a 0.45 micron membrane filter. Field filtration is recommended to ensure test results represent conditions at time of sampling.
Total Metals in Water by CRC ICPMS	E420 Vancouver - Environmental	Water	EPA 200.2/6020B (mod)	Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Total Chromium in Water by CRC ICPMS (Low Level)	E420.Cr-L Vancouver - Environmental	Water	EPA 200.2/6020B (mod)	Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS.
Dissolved Metals in Water by CRC ICPMS	E421 Vancouver - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Chromium in Water by CRC ICPMS (Low Level)	E421.Cr-L Vancouver - Environmental	Water	APHA 3030 B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS
Total Mercury in Water by CVAAS	E508 Vancouver - Environmental	Water	EPA 1631E (mod)	Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS
Dissolved Mercury in Water by CVAAS	E509 Vancouver - Environmental	Water	APHA 3030B/EPA 1631E (mod)	Water samples are filtered (0.45 um), preserved with HCl, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.
Dissolved Hardness (Calculated)	EC100 Vancouver - Environmental	Water	APHA 2340B	"Hardness (as CaCO ₃), dissolved" is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO ₃ equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Ion Balance using Dissolved Metals	EC101 Calgary - Environmental	Water	APHA 1030E	Cation Sum, Anion Sum, and Ion Balance are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Dissolved species are used where available. Minor ions are included where data is present. Ion Balance cannot be calculated accurately for waters with very low electrical conductivity (EC).

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Ammonia	EP298 Calgary - Environmental	Water		Sample preparation for Preserved Nutrients Water Quality Analysis.
Digestion for TKN in water	EP318 Calgary - Environmental	Water	APHA 4500-Norg D (mod)	Samples are digested using block digestion with Copper Sulfate Digestion Reagent.
Preparation for Total Organic Carbon by Combustion	EP355 Calgary - Environmental	Water		Preparation for Total Organic Carbon by Combustion
Preparation for Dissolved Organic Carbon for Combustion	EP358 Calgary - Environmental	Water	APHA 5310 B (mod)	Preparation for Dissolved Organic Carbon
Digestion for Total Phosphorus in water	EP372 Calgary - Environmental	Water	APHA 4500-P E (mod).	Samples are heated with a persulfate digestion reagent.
Dissolved Metals Water Filtration	EP421 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO ₃ .
Dissolved Mercury Water Filtration	EP509	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HCl.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.

CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.

DQO = Data Quality Objective.

LOR = Limit of Reporting (detection limit).

RPD = Relative Percentage Difference

= Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

CERTIFICATE OF ANALYSIS

Work Order : **CG2205002**
Client : **Teck Coal Limited**
Contact : Mike Pope
Address : 421 PINE AVE
Sparwood BC Canada V0B 2G0
Telephone : ----
Project : REGIONAL EFFECTS PROGRAM
PO : VPO00816101
C-O-C number : April EVO LAEMP 2022
Sampler : Alex McClymont
Site : ----
Quote number : Teck Coal Master Quote
No. of samples received : 8
No. of samples analysed : 8

Page : 1 of 11
Laboratory : Calgary - Environmental
Account Manager : Lyudmyla Shvets
Address : 2559 29th Street NE
Calgary AB Canada T1Y 7B5
Telephone : +1 403 407 1800
Date Samples Received : 29-Apr-2022 09:45
Date Analysis Commenced : 30-Apr-2022
Issue Date : 06-May-2022 13:09

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

<i>Signatories</i>	<i>Position</i>	<i>Laboratory Department</i>
Angela Ren	Team Leader - Metals	Metals, Burnaby, British Columbia
Anthony Calero	Team Leader - Inorganics	Inorganics, Calgary, Alberta
Elke Tabora		Inorganics, Calgary, Alberta
Harpreet Chawla	Team Leader - Inorganics	Inorganics, Calgary, Alberta
Harpreet Chawla	Team Leader - Inorganics	Metals, Calgary, Alberta
Kim Jensen	Department Manager - Metals	Metals, Burnaby, British Columbia
Owen Cheng		Metals, Burnaby, British Columbia
Parker Sgarbossa	Laboratory Analyst	Inorganics, Calgary, Alberta
Ruby Pham	Lab Assistant	Metals, Burnaby, British Columbia
Ruifang Zheng	Analyst	Inorganics, Calgary, Alberta
Sara Niroomand		Inorganics, Calgary, Alberta
Zakieh Lalonde		Inorganics, Calgary, Alberta

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

<i>Unit</i>	<i>Description</i>
-	No Unit
%	percent
µg/L	micrograms per litre
µS/cm	Microsiemens per centimetre
meq/L	milliequivalents per litre
mg/L	milligrams per litre
mV	millivolts
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Workorder Comments

Samples 1-3,6 no Ultra but in COC , 4,7,8 No Total HG but Inc. COC

Sample Comments

<i>Sample</i>	<i>Client Id</i>	<i>Comment</i>
CG2205002-001	RG_MICOMP_WS_LAEMP_EV O_2022-04_NP	Updated WO to rush TAT as per client.

Qualifiers

Qualifier	Description
DLDS	Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).
DTC	Dissolved concentration exceeds total. Results were confirmed by re-analysis.
DTMF	Dissolved concentration exceeds total for field-filtered metals sample. Metallic contaminants may have been introduced to dissolved sample during field filtration.
HTD	Hold time exceeded for re-analysis or dilution, but initial testing was conducted within hold time.
RRV	Reported result verified by repeat analysis.
TKNI	TKN result may be biased low due to Nitrate interference. Nitrate-N is > 10x TKN.

QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: CG2205002	Page	: 1 of 33
Client	: Teck Coal Limited	Laboratory	: Calgary - Environmental
Contact	: Mike Pope	Account Manager	: Lyudmyla Shvets
Address	: 421 PINE AVE Sparwood BC Canada V0B 2G0	Address	: 2559 29th Street NE Calgary, Alberta Canada T1Y 7B5
Telephone	: ----	Telephone	: +1 403 407 1800
Project	: REGIONAL EFFECTS PROGRAM	Date Samples Received	: 29-Apr-2022 09:45
PO	: VPO00816101	Issue Date	: 06-May-2022 13:09
C-O-C number	: April EVO LAEMP 2022		
Sampler	: Alex McClymont		
Site	: ----		
Quote number	: Teck Coal Master Quote		
No. of samples received	: 8		
No. of samples analysed	: 8		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.

CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.

DQO: Data Quality Objective.

LOR: Limit of Reporting (detection limit).

RPD: Relative Percent Difference.

Workorder Comments

Holding times are displayed as "----" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Matrix: **Water** Evaluation: * = Holding time exceedance ; ✓ = Within Holding Time

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

EHT: Exceeded ALS recommended hold time prior to analysis.

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water** Evaluation: * = QC frequency outside specification; ✓ = QC frequency within specification.

Quality Control Sample Type	Method	QC Lot #	Count		Frequency (%)		Evaluation
			QC	Regular	Actual	Expected	
Analytical Methods							
Laboratory Duplicates (DUP)							
Acidity by Titration	E283	473208	1	20	5.0	5.0	✓
Alkalinity Species by Titration	E290	473192	1	20	5.0	5.0	✓
Ammonia by Fluorescence	E298	474150	1	20	5.0	5.0	✓
Bromide in Water by IC (Low Level)	E235.Br-L	473230	1	20	5.0	5.0	✓
Chloride in Water by IC (Low Level)	E235.Cl-L	473231	1	20	5.0	5.0	✓

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 Calgary - Environmental	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 Calgary - Environmental	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
Turbidity by Nephelometry	E121 Calgary - Environmental	Water	APHA 2130 B (mod)	Turbidity is measured by the nephelometric method, by measuring the intensity of light scatter under defined conditions.
ORP by Electrode	E125 Calgary - Environmental	Water	ASTM D1498 (mod)	Oxidation reduction potential is reported as the oxidation-reduction potential of the platinum metal-reference electrode employed, measured in mV. For high accuracy test results, it is recommended that this analysis be conducted in the field.
TSS by Gravimetry (Low Level)	E160-L Calgary - Environmental	Water	APHA 2540 D (mod)	Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, following by drying of the filter at 104 ± 1°C, with gravimetric measurement of the filtered solids. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.
TDS by Gravimetry	E162 Calgary - Environmental	Water	APHA 2540 C (mod)	Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, with evaporation of the filtrate at 180 ± 2°C for 16 hours or to constant weight, with gravimetric measurement of the residue.
Bromide in Water by IC (Low Level)	E235.Br-L Calgary - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Chloride in Water by IC (Low Level)	E235.Cl-L Calgary - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Fluoride in Water by IC	E235.F Calgary - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC (Low Level)	E235.NO2-L Calgary - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC (Low Level)	E235.NO3-L Calgary - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Sulfate in Water by IC	E235.SO4 Calgary - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Acidity by Titration	E283 Calgary - Environmental	Water	APHA 2310 B (mod)	Acidity is determined by potentiometric titration to pH endpoint of 8.3

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Alkalinity Species by Titration	E290 Calgary - Environmental	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 Calgary - Environmental	Water	J. Environ. Monit., 2005, 7, 37-42 (mod)	Ammonia in water is analyzed by flow-injection analysis with fluorescence detection after reaction with orthophthaldialdehyde (OPA).
Total Kjeldahl Nitrogen by Fluorescence (Low Level)	E318 Calgary - Environmental	Water	APHA 4500-Norg D (mod)	Total Kjeldahl Nitrogen is determined using block digestion followed by flow-injection analysis with fluorescence detection.
Total Organic Carbon (Non-Purgeable) by Combustion (Low Level)	E355-L Calgary - Environmental	Water	APHA 5310 B (mod)	Total Organic Carbon (Non-Purgeable), also known as NPOC (total), is a direct measurement of TOC after an acidified sample has been purged to remove inorganic carbon (IC). Analysis is by high temperature combustion with infrared detection of CO ₂ . NPOC does not include volatile organic species that are purged off with IC. For samples where the majority of total carbon (TC) is comprised of IC (which is common), this method is more accurate and more reliable than the TOC by subtraction method (i.e. TC minus TIC).
Dissolved Organic Carbon by Combustion (Low Level)	E358-L Calgary - Environmental	Water	APHA 5310 B (mod)	Dissolved Organic Carbon (Non-Purgeable), also known as NPOC (dissolved), is a direct measurement of DOC after a filtered (0.45 micron) sample has been acidified and purged to remove inorganic carbon (IC). Analysis is by high temperature combustion with infrared detection of CO ₂ . NPOC does not include volatile organic species that are purged off with IC. For samples where the majority of DC (dissolved carbon) is comprised of IC (which is common), this method is more accurate and more reliable than the DOC by subtraction method (i.e. DC minus DIC).
Total Phosphorus by Colourimetry (0.002 mg/L)	E372-U Calgary - Environmental	Water	APHA 4500-P E (mod).	Total Phosphorus is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Dissolved Orthophosphate by Colourimetry (Ultra Trace Level 0.001 mg/L)	E378-U Calgary - Environmental	Water	APHA 4500-P F (mod)	Dissolved Orthophosphate is determined colourimetrically on a sample that has been lab or field filtered through a 0.45 micron membrane filter. Field filtration is recommended to ensure test results represent conditions at time of sampling.
Total Metals in Water by CRC ICPMS	E420 Vancouver - Environmental	Water	EPA 200.2/6020B (mod)	Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Total Chromium in Water by CRC ICPMS (Low Level)	E420.Cr-L Vancouver - Environmental	Water	EPA 200.2/6020B (mod)	Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS.
Dissolved Metals in Water by CRC ICPMS	E421 Vancouver - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Chromium in Water by CRC ICPMS (Low Level)	E421.Cr-L Vancouver - Environmental	Water	APHA 3030 B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS
Total Mercury in Water by CVAAS	E508 Vancouver - Environmental	Water	EPA 1631E (mod)	Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS
Total Mercury in Water by CVAFS (Low Level, LOR = 0.5 ppt)	E508-L Vancouver - Environmental	Water	EPA 1631E (mod)	Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAFS.
Dissolved Mercury in Water by CVAAS	E509 Calgary - Environmental	Water	APHA 3030B/EPA 1631E (mod)	Water samples are filtered (0.45 um), preserved with HCl, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.
Dissolved Hardness (Calculated)	EC100 Vancouver - Environmental	Water	APHA 2340B	"Hardness (as CaCO ₃), dissolved" is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO ₃ equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Ion Balance using Dissolved Metals	EC101 Calgary - Environmental	Water	APHA 1030E	Cation Sum, Anion Sum, and Ion Balance are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Dissolved species are used where available. Minor ions are included where data is present. Ion Balance cannot be calculated accurately for waters with very low electrical conductivity (EC).
Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Ammonia	EP298 Calgary - Environmental	Water		Sample preparation for Preserved Nutrients Water Quality Analysis.
Digestion for TKN in water	EP318 Calgary - Environmental	Water	APHA 4500-Norg D (mod)	Samples are digested using block digestion with Copper Sulfate Digestion Reagent.
Preparation for Total Organic Carbon by Combustion	EP355 Calgary - Environmental	Water		Preparation for Total Organic Carbon by Combustion
Preparation for Dissolved Organic Carbon by Combustion	EP358 Calgary - Environmental	Water	APHA 5310 B (mod)	Preparation for Dissolved Organic Carbon
Digestion for Total Phosphorus in water	EP372 Calgary - Environmental	Water	APHA 4500-P E (mod).	Samples are heated with a persulfate digestion reagent.
Dissolved Metals Water Filtration	EP421 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO ₃ .

Date Samples Received : 29-Apr-2022 09:45
Date Analysis Commenced : 30-Apr-2022
Issue Date : 06-May-2022 13:09

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
● Matrix Spike (MS) Report; Recovery and Acceptance Limits
● Reference Material (RM) Report; Recovery and Acceptance Limits
● Method Blank (MB) Report; Recovery and Acceptance Limits
● Laboratory Control Sample (LCS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Table with 3 columns: Signatories, Position, Laboratory Department. Lists names like Angela Ren, Anthony Calero, Elke Tabora, Harpreet Chawla, Kim Jensen, Owen Cheng, Parker Sgarbossa, Ruby Pham, Ruifang Zheng, Sara Niroomand, Zakieh Lalonde and their respective roles and departments.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.

CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.

DQO = Data Quality Objective.

LOR = Limit of Reporting (detection limit).

RPD = Relative Percentage Difference

= Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

Date Samples Received : 29-Apr-2022 09:45
Date Analysis Commenced : 30-Apr-2022
Issue Date : 06-May-2022 19:02

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

<i>Signatories</i>	<i>Position</i>	<i>Laboratory Department</i>
Angela Ren	Team Leader - Metals	Metals, Burnaby, British Columbia
Anthony Calero	Team Leader - Inorganics	Inorganics, Calgary, Alberta
Elke Tabora		Inorganics, Calgary, Alberta
Harpreet Chawla	Team Leader - Inorganics	Inorganics, Calgary, Alberta
Janice Leung	Supervisor - Organics Instrumentation	Organics, Burnaby, British Columbia
Kevin Duarte	Supervisor - Metals ICP Instrumentation	Metals, Burnaby, British Columbia
Kim Jensen	Department Manager - Metals	Metals, Burnaby, British Columbia
Kyle Chang	Lab Assistant	Metals, Burnaby, British Columbia
Owen Cheng		Metals, Burnaby, British Columbia
Parker Sgarbossa	Laboratory Analyst	Inorganics, Calgary, Alberta
Ruifang Zheng	Analyst	Inorganics, Calgary, Alberta
Sara Niroomand		Inorganics, Calgary, Alberta
Zakieh Lalonde		Inorganics, Calgary, Alberta

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
 LOR: Limit of Reporting (detection limit).

Unit	Description
-	No Unit
%	percent
µg/L	micrograms per litre
µS/cm	Microsiemens per centimetre
meq/L	milliequivalents per litre
mg/L	milligrams per litre
mV	millivolts
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Sample Comments

Sample	Client Id	Comment
CG2205003-001	EV_MC3a_WS_LAEMP_EVO_ 2022-04_NP	Updated WO to rush TAT as per client.

Qualifiers

Qualifier	Description
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).
DTMF	Dissolved concentration exceeds total for field-filtered metals sample. Metallic contaminants may have been introduced to dissolved sample during field filtration.

Page : 4 of 8
Work Order : CG2205003
Client : Teck Coal Limited
Project : ELKVIEW OPERATIONS

SESC

*Non-opaque sample container received for selenium speciation analysis.
Conversions of some selenium species can occur if samples are exposed to light*

No. of samples received	: 1		
No. of samples analysed	: 1		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.

CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.

DQO: Data Quality Objective.

LOR: Limit of Reporting (detection limit).

RPD: Relative Percent Difference.

Workorder Comments

Holding times are displayed as "----" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- Quality Control Sample Frequency Outliers occur - please see following pages for full details.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Matrix: **Water** Evaluation: * = Holding time exceedance ; ✓ = Within Holding Time

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended
 Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water** Evaluation: * = QC frequency outside specification; ✓ = QC frequency within specification.

Quality Control Sample Type	Method	QC Lot #	Count		Frequency (%)		Evaluation
			QC	Regular	Actual	Expected	
Analytical Methods							
Laboratory Duplicates (DUP)

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 Calgary - Environmental	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 Calgary - Environmental	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
Turbidity by Nephelometry	E121 Calgary - Environmental	Water	APHA 2130 B (mod)	Turbidity is measured by the nephelometric method, by measuring the intensity of light scatter under defined conditions.
ORP by Electrode	E125 Calgary - Environmental	Water	ASTM D1498 (mod)	Oxidation reduction potential is reported as the oxidation-reduction potential of the platinum metal-reference electrode employed, measured in mV. For high accuracy test results, it is recommended that this analysis be conducted in the field.
TSS by Gravimetry (Low Level)	E160-L Calgary - Environmental	Water	APHA 2540 D (mod)	Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, following by drying of the filter at 104 ± 1°C, with gravimetric measurement of the filtered solids. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.
TDS by Gravimetry	E162 Calgary - Environmental	Water	APHA 2540 C (mod)	Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, with evaporation of the filtrate at 180 ± 2°C for 16 hours or to constant weight, with gravimetric measurement of the residue.
Bromide in Water by IC (Low Level)	E235.Br-L Calgary - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Chloride in Water by IC (Low Level)	E235.Cl-L Calgary - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Fluoride in Water by IC	E235.F Calgary - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC (Low Level)	E235.NO2-L Calgary - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC (Low Level)	E235.NO3-L Calgary - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Sulfate in Water by IC	E235.SO4 Calgary - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Acidity by Titration	E283 Calgary - Environmental	Water	APHA 2310 B (mod)	Acidity is determined by potentiometric titration to pH endpoint of 8.3

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Alkalinity Species by Titration	E290 Calgary - Environmental	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 Calgary - Environmental	Water	J. Environ. Monit., 2005, 7, 37-42 (mod)	Ammonia in water is analyzed by flow-injection analysis with fluorescence detection after reaction with orthophthaldialdehyde (OPA).
Total Kjeldahl Nitrogen by Fluorescence (Low Level)	E318 Calgary - Environmental	Water	APHA 4500-Norg D (mod)	Total Kjeldahl Nitrogen is determined using block digestion followed by flow-injection analysis with fluorescence detection.
Total Organic Carbon (Non-Purgeable) by Combustion (Low Level)	E355-L Calgary - Environmental	Water	APHA 5310 B (mod)	Total Organic Carbon (Non-Purgeable), also known as NPOC (total), is a direct measurement of TOC after an acidified sample has been purged to remove inorganic carbon (IC). Analysis is by high temperature combustion with infrared detection of CO ₂ . NPOC does not include volatile organic species that are purged off with IC. For samples where the majority of total carbon (TC) is comprised of IC (which is common), this method is more accurate and more reliable than the TOC by subtraction method (i.e. TC minus TIC).
Dissolved Organic Carbon by Combustion (Low Level)	E358-L Calgary - Environmental	Water	APHA 5310 B (mod)	Dissolved Organic Carbon (Non-Purgeable), also known as NPOC (dissolved), is a direct measurement of DOC after a filtered (0.45 micron) sample has been acidified and purged to remove inorganic carbon (IC). Analysis is by high temperature combustion with infrared detection of CO ₂ . NPOC does not include volatile organic species that are purged off with IC. For samples where the majority of DC (dissolved carbon) is comprised of IC (which is common), this method is more accurate and more reliable than the DOC by subtraction method (i.e. DC minus DIC).
Total Phosphorus by Colourimetry (0.002 mg/L)	E372-U Calgary - Environmental	Water	APHA 4500-P E (mod).	Total Phosphorus is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Dissolved Orthophosphate by Colourimetry (Ultra Trace Level 0.001 mg/L)	E378-U Calgary - Environmental	Water	APHA 4500-P F (mod)	Dissolved Orthophosphate is determined colourimetrically on a sample that has been lab or field filtered through a 0.45 micron membrane filter. Field filtration is recommended to ensure test results represent conditions at time of sampling.
Total Metals in Water by CRC ICPMS	E420 Vancouver - Environmental	Water	EPA 200.2/6020B (mod)	Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Total Chromium in Water by CRC ICPMS (Low Level)	E420.Cr-L Vancouver - Environmental	Water	EPA 200.2/6020B (mod)	Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS.
Dissolved Metals in Water by CRC ICPMS	E421 Vancouver - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Chromium in Water by CRC ICPMS (Low Level)	E421.Cr-L Vancouver - Environmental	Water	APHA 3030 B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS
Total Mercury in Water by CVAAS	E508 Vancouver - Environmental	Water	EPA 1631E (mod)	Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS
Dissolved Mercury in Water by CVAAS	E509 Vancouver - Environmental	Water	APHA 3030B/EPA 1631E (mod)	Water samples are filtered (0.45 um), preserved with HCl, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.
Selenium Species (SeIV, SeVI, SeCN) in Water by HPLC-ICPMS	E540 Vancouver - Environmental	Water	Miekeley Spect. Acta B 60 (2005) 633-641	Instrumental analysis of Speciated Selenium (Se) is by Anion Exchange HPLC-ICPMS. Species quantified are Selenite (SeIV), Selenate (VI) and Selenocyanate (SeCN). Field filtration is recommended. Reported Total Unknown Se Species is semi-quantitative in nature and consists of a sum of all the unidentified Selenium peaks observed in the chromatogram. This included SeMet, MeSe, and DMSeO unless separately requested for identification and quantification. Undetectable unknown species indicates these other species are not present in the sample.
Volatile Selenium Species (DMSe, DMDSe) by Headspace GC-MS	E611.Se Vancouver - Environmental	Water	EPA 8260D (mod)	Dimethyl selenide and dimethyl diselenide are analyzed by static headspace GC-MS. Samples are prepared in headspace vials and are heated and agitated on the headspace autosampler, causing VOCs to partition between the aqueous phase and the headspace in accordance with Henry's law..
Dissolved Hardness (Calculated)	EC100 Vancouver - Environmental	Water	APHA 2340B	"Hardness (as CaCO ₃), dissolved" is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO ₃ equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Ion Balance using Dissolved Metals	EC101 Calgary - Environmental	Water	APHA 1030E	Cation Sum, Anion Sum, and Ion Balance are calculated based on guidance from APHA Standard Methods (1030E Checking Correctness of Analysis). Dissolved species are used where available. Minor ions are included where data is present. Ion Balance cannot be calculated accurately for waters with very low electrical conductivity (EC).

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Ammonia	EP298 Calgary - Environmental	Water		Sample preparation for Preserved Nutrients Water Quality Analysis.
Digestion for TKN in water	EP318 Calgary - Environmental	Water	APHA 4500-Norg D (mod)	Samples are digested using block digestion with Copper Sulfate Digestion Reagent.
Preparation for Total Organic Carbon by Combustion	EP355 Calgary - Environmental	Water		Preparation for Total Organic Carbon by Combustion

<i>Preparation Methods</i>	<i>Method / Lab</i>	<i>Matrix</i>	<i>Method Reference</i>	<i>Method Descriptions</i>
Preparation for Dissolved Organic Carbon for Combustion	EP358 Calgary - Environmental	Water	APHA 5310 B (mod)	Preparation for Dissolved Organic Carbon
Digestion for Total Phosphorus in water	EP372 Calgary - Environmental	Water	APHA 4500-P E (mod).	Samples are heated with a persulfate digestion reagent.
Dissolved Metals Water Filtration	EP421 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO ₃ .
Dissolved Mercury Water Filtration	EP509 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HCl.
Selenium Species Preparation	EP540 Vancouver - Environmental	Water	Miekeley Spect. Acta B 60 (2005) 633-641	Instrumental analysis of Speciated Selenium (Se) is by Anion Exchange HPLC-ICPMS. Species quantified are Selenite (SeIV), Selenate (VI) and Selenocyanate (SeCN). Field filtration is recommended. Reported Total Unknown Se Species is semi-quantitative in nature and consists of a sum of all the unknown peaks observed in the chromatogram.
VOCs Preparation for Headspace Analysis	EP581 Vancouver - Environmental	Water	EPA 5021A (mod)	Samples are prepared in headspace vials and are heated and agitated on the headspace autosampler. An aliquot of the headspace is then injected into the GC/MS-FID system.

QUALITY CONTROL REPORT

Work Order : CG2205003

Page : 1 of 17

Client : Teck Coal Limited
Contact : Mike Pope
Address : 421 PINE AVE
Sparwood BC Canada V0B 2G0
Telephone : ----
Project : ELKVIEW OPERATIONS
PO : VPO00816101
C-O-C number : EVO LAEMP_2022_APR_ALS
Sampler : Alex McClymont
Site : ----
Quote number : Teck Coal Master Quote
No. of samples received : 1
No. of samples analysed : 1

Laboratory : Calgary - Environmental
Account Manager : Lyudmyla Shvets
Address : 2559 29th Street NE
Calgary, Alberta Canada T1Y 7B5
Telephone : +1 403 407 1800
Date Samples Received : 29-Apr-2022 09:45
Date Analysis Commenced : 30-Apr-2022
Issue Date : 06-May-2022 19:03

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
● Matrix Spike (MS) Report; Recovery and Acceptance Limits
● Reference Material (RM) Report; Recovery and Acceptance Limits
● Method Blank (MB) Report; Recovery and Acceptance Limits
● Laboratory Control Sample (LCS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Table with 3 columns: Signatories, Position, Laboratory Department. Lists names like Angela Ren, Anthony Calero, Elke Tabora, Harpreet Chawla, Janice Leung, Kevin Duarte, Kim Jensen, Kyle Chang, Owen Cheng, Parker Sgarbossa, Ruifang Zheng, Sara Niroomand, Zakieh Lalonde and their respective roles and departments.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.

CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.

DQO = Data Quality Objective.

LOR = Limit of Reporting (detection limit).

RPD = Relative Percentage Difference

= Indicates a QC result that did not meet the ALS DQO.

Workorder Comments

Holding times are displayed as "---" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

Client : Teck Coal Limited
Project : REGIONAL EFFECTS PROGRAM

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

<i>Unit</i>	<i>Description</i>
-	No Unit
%	percent
µg/L	micrograms per litre
µS/cm	Microsiemens per centimetre
meq/L	milliequivalents per litre
mg/L	milligrams per litre
mV	millivolts
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Workorder Comments

As per on the COC, Fraction 2 does not have any analysis requested. Sample on Hold

Qualifiers

<i>Qualifier</i>	<i>Description</i>
DLDS	Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.
DLM	Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).
TKNI	TKN result may be biased low due to Nitrate interference. Nitrate-N is > 10x TKN.

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.

CAS Number: Chemical Abstracts Service number is a unique identifier assigned to discrete substances.

DQO: Data Quality Objective.

LOR: Limit of Reporting (detection limit).

RPD: Relative Percent Difference.

Workorder Comments

Holding times are displayed as "----" if no guidance exists from CCME, Canadian provinces, or broadly recognized international references.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Project : REGIONAL EFFECTS PROGRAM

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Matrix: **Water** Evaluation: * = Holding time exceedance ; ✓ = Within Holding Time

Project : REGIONAL EFFECTS PROGRAM

Matrix: Water Evaluation: * = Holding time exceedance ; ✓ = Within Holding Time

Table with columns: Analyte Group, Method, Sampling Date, Extraction / Preparation (Preparation Date, Holding Times Rec/Actual, Eval), Analysis (Analysis Date, Holding Times Rec/Actual, Eval). Rows include Physical Tests for TSS by Gravimetry and Turbidity by Nephelometry for various sample IDs like RG_ERCKMD, RG_RIVER, RG_ERCKDT, and RG_ERCKUT.

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended
Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water** Evaluation: * = QC frequency outside specification; ✓ = QC frequency within specification.

Quality Control Sample Type	Method	QC Lot #	Count		Frequency (%)		Evaluation
			QC	Regular	Actual	Expected	
Analytical Methods							
Laboratory Duplicates (DUP)							
Acidity by Titration	E283	489159	1	20	5.0	5.0	✓
Alkalinity Species by Titration	E290	489152	1	17	5.8	5.0	✓
Ammonia by Fluorescence	E298	489345	1	11	9.0	5.0	✓
Bromide in Water by IC (Low Level)	E235.Br-L	488347	1	15	6.6	5.0	✓
Chloride in Water by IC (Low Level)	E235.Cl-L	488348	1	15	6.6	5.0	✓
Conductivity in Water	E100	489151	1	17	5.8	5.0	✓
Dissolved Chromium in Water by CRC ICPMS (Low Level)	E421.Cr-L	491084	1	5	20.0	5.0	✓
Dissolved Mercury in Water by CVAAS	E509	491104	1	9	11.1	5.0	✓
Dissolved Metals in Water by CRC ICPMS	E421	491085	2	5	40.0	5.0	✓
Dissolved Organic Carbon by Combustion (Low Level)	E358-L	489550	1	5	20.0	5.0	✓
Dissolved Orthophosphate by Colourimetry (Ultra Trace Level 0.001 mg/L)	E378-U	488456	1	20	5.0	5.0	✓
Fluoride in Water by IC	E235.F	488351	1	15	6.6	5.0	✓
Nitrate in Water by IC (Low Level)	E235.NO3-L	488349	1	15	6.6	5.0	✓
Nitrite in Water by IC (Low Level)	E235.NO2-L	488350	1	15	6.6	5.0	✓
ORP by Electrode	E125	489134	1	5	20.0	5.0	✓
pH by Meter	E108	489150	1	20	5.0	5.0	✓
Sulfate in Water by IC	E235.SO4	488346	1	15	6.6	5.0	✓
TDS by Gravimetry	E162	489720	1	11	9.0	5.0	✓
Total Chromium in Water by CRC ICPMS (Low Level)	E420.Cr-L	491095	1	5	20.0	5.0	✓
Total Kjeldahl Nitrogen by Fluorescence (Low Level)	E318	489191	1	7	14.2	5.0	✓
Total Mercury in Water by CVAFS (Low Level, LOR = 0.5 ppt)	E508-L	493067	1	20	5.0	5.0	✓
Total Metals in Water by CRC ICPMS	E420	491096	2	5	40.0	5.0	✓
Total Organic Carbon (Non-Purgeable) by Combustion (Low Level)	E355-L	489551	1	5	20.0	5.0	✓
Total Phosphorus by Colourimetry (0.002 mg/L)	E372-U	488675	2	26	7.6	5.0	✓
Turbidity by Nephelometry	E121	488345	1	9	11.1	5.0	✓
Laboratory Control Samples (LCS)							
Acidity by Titration	E283	489159	1	20	5.0	5.0	✓
Alkalinity Species by Titration	E290	489152	1	17	5.8	5.0	✓
Ammonia by Fluorescence	E298	489345	1	11	9.0	5.0	✓
Bromide in Water by IC (Low Level)	E235.Br-L	488347	1	15	6.6	5.0	✓
Chloride in Water by IC (Low Level)	E235.Cl-L	488348	1	15	6.6	5.0	✓
Conductivity in Water	E100	489151	1	17	5.8	5.0	✓
