^a The sediment samples at RG_SCOUTDS had elevated concentrations of selenium and PAHs in 2022 compared to previous years, and these elevated concentrations correlated strongly with elevated water and fine particle content. The area was re-sampled in February 2023, resulting in 4 of 5 samples having lower moisture, fine particle, selenium and PAH content, while 1 of 5 samples had results consistent with the September 2022 samples.
